Van Helmont's WORKS:

Containing his most Excellent

PHILOSOPHY, } CHIRURGERY,
PHYSICK, } ANATOMY.

WHEREIN

The Philosophy of the Schools is Examined,
their Errors Refuted, and the whole

Body of Physick

REFORMED and RECTIFIED.

Being a New rise and progresse of PHILOSOPHY
and MEDICINE for the Cure of Diseases, and
Lengthening of Life.

Made English by J. C. sometime of M. H. Oxon.

L O N D O N,
Printed for Lodowick Lloyd, at the Castle in Cornhill,
1664.

Van Helmont

WORKS

Containing his own Experiments

PHYSIOLOGY, CHIRURGERY,
AND MEDICINE

WHEREIN

The Philosophy of the Human Body is Examined,
and the Principles of the Whole

Body of Physick

REVISED and RECTIFIED

Containing a New Rise and Progress of Philosophy
and MEDICINE for the Cure of Diseases, and
Prolonging of Life.

Blade English by J. C. Somerville of M. B. Oxon.

LONDON

Printed for E. Bohn, 10, St. Paul's Churchyard, in Cornhill.

TO THE
English READER.

S the bare report of *Solomon's Wisdom*, was enough to attract the *Eastern Queens* attention; and that, to travel her to the Fountain-head it self: (which she relished at first, as pretious Wine, but then as divine *Nectar*) so doubtless, the loud Fame of Learned *Helmont*, ringing in the ears of our (as well as other) Nations, must needs excite the attentions, and level the Affections of those that can value the Wisdom found in the true knowledge of Nature and Art; and so sharpen their Appetites, as to induce them to find where the Fruit grows; and there to feed their fill: their fill of essential (not formal) Learning; of experimental (not historical) Knowledge, of *Hermetick* (not *Culinary*) Practice. So that, methinks 'tis sufficient to tell thee, that great *Helmont* now dictates in thine own Dialect. Wouldst thou then find a clear efflux of pure (not flashy) *Ingenuity*? here it is. Wouldst thou behold acute Invention, in its unmixt clarity? here it is. Wouldst thou contemplate the depth of exact and solid Judgement? here it is. Wouldst thou be acquainted with Arguments *Impregnable*, to the production of Truth, and conviction of Error? here they are. Wouldst thou understand the vanity of evolving unweldy Volumns of Vegetables; and neglecting the utility of powerful Medicines? Wouldst thou discern the vast difference between the efficacious kernel and useless shell of natural Products? between potential *Essences*, and impotent Superfluities? between heterogeneal *Co-mixtures*, and artificial Separations, Purifications, and Exaltations? In a word, wouldst thou not dwell in the Circumference of Knowledge, but dive into the very Center it self? here then imploy thy Faculties, here exercise thy Abilities, here impend thy Studies. Then wilt thou moreover find (to omit his Humanity, Magnanimity, Piety, and Charity; wherein he much excelled) his Disputes subtil, grave, and of great validity: his Assertions *sound*, his Demonstrations *clear*, and his Conclusions

A ¶

infallible:

infallible : eradicating *Error*, and implanting of *Truth* ; and that with rare Integrity, and indefatigable Industry.

But (saith *Zoilus*) *Diruit quidem, non autem Ædificat*. A Position well becoming the owners of it ; granting a Verity to infer a Fallacy. As how ? as thus ; That Learned *Helmont* hath demolished the feeble Fabrick of an *erroneous* Method, is apparently true ; not onely in it self, but confest, even by his adversaries ; but that he hath not rebuilt a stronger Structure on a firmer Foundation, is as false : and that it is so, this his unparallel'd Works do demonstrate, to any intelligent Reader, that is not drunk with envy ; or poysoned with malice ; or infected with prejudice. His own Works indeed, do best expresse his worth. Neither can I suppose, that another Pen can Preface any addition to it. Canst thou Reader, sum up the perfections required in a *Philosopher* not Traditional ; in a Christian not Hypocritical ; in a Physitian not Verbal, not Superficial ? then art thou nearest his true Character. But he that shall attempt to tell thee the *Summa totalis* of him, or these his eminent Emanations ; may sooner want wind for his Words, than work for his Pen ; and whilst he recounteth their excellencies, seem to numerate the Sea's sand. I therefore desist, and refer to thy experience, which may happily evidence thy proficiency ; that, thy industry ; and both render thee gratefully joyful, for so great a jewel : whose due rate and proportion,

That thou mayst rightly apprehend,

Is wisht by thy well-willing Friend.

H. BLUNDEN,

Med. Licentiat.

T O

ידוה

TO THE

Unutterable WORD,

THE

AUTHOR

Offers up a SACRIFICE in his Mother Tongue.

Omnipotent, Eternal, and Incomprehensible Being! the Original of all Good. Thou hast committed unto me a Talent, the which I expose to open Usury: But I acknowledge and confess my nothing impotency, my vile and abusive unprofitableness. Thus being overwhelmed in the Abyss of my own nothingness: I pray thee, O thou All-providing Good, that thou wouldest clementiously accept of this Book, O thou Eternal Beginning, and End of all Wisdom: Let thy saving Will be done, O Lord, in the grace of thy Love, by

this dry tree, this meat for wormes, this fewel for the flame, thy unprofitable servant, the son of thy hand-maid. Unless at length thou perfect me, and preserve all thy gifts they shall perish in me for ever. This I ingeniously confess, from the knowledge of my very innermost part, before thee, O Lord, unto whom all things are thorowly known in truth: and before the World, unto whom most of the most excellent truths lay hid: I am amazed at the largeness and greatness of thy benefits towards my nothingness. So being prostrated I celebrate thy most glorious Name, and that Name I invoke from above, O Jehovah, thou most faithful lover of Men! O holy and incomprehensible Name! at all times and alonie to be sanctified, and the onely free Sanctifier of his Saints alone. Favourably behold from the Throne of thy Omnipotency, the miseries of the living, help the sons of men, seeing it is thy delight to be present with them. Remember the word of thy Promise, no longer to be the God of our Fathers, as in times past, but now as a God declared to be our Father: No longer the God of Abraham, the God of Isaac, and the God of Israel: but as God, Jesus, the God of Mary our Mother,

ther, and who art made our Brother in the love of thy grace. All the end and scope of my desires tendeth to this, that thy incomprehensible Name may be sanctified, not only because thou art called the Thrice most Great and Excellent; but also, because thou only art All, unto whom every wish of sanctifying Love doth properly belong: seeing that thou standest in no need of us, neither can we devote unto thee any thing else. The Prophet did accept, A, A, A, Lord, I cannot speak, behold I am an Infant: but I reply to this Prophet, O, O, O, Lord, my thoughts fail me, and do melt in a naked wish of Love, of the sanctifying of thy Name: For loe, O Lord, I am nought but nothing, nor any thing besides, but as it hath pleased thee, that I may pertain unto thee. O All, of All, and All my Desire: I deservedly seem to offer unto thee in my Mother Tongue, and also to vow the Feude or Fee-farm of my Essence and Property, wherewith I being invested by thee, I enjoy the use of them for the help of my Neighbour. For although the first conception of the Soul consisteth out of Words, and so is without a proper tongue: Yet I perceive that it is as yet crude, and not sequestred, as long as it is not polished, and not being joyned to the mind, doth depart into Cogitations, Words, and Writing. This crudity, I perceive doth make an infirm and unstable object of my first Conception, and soon darkens it again: Therefore thy Eternal Wisdom hath granted that it should be carried further, even unto my Mind.

'Tis true indeed, that thou wilt be worshipped by men in the Spirit, but not in such a manner that it may remain in the undistinction of the first object: But moreover, the Angels, and pure simple Spirits, although they nakedly adore thee in Cogitation, as Spirits; yet they are busied by a certain, and unknown Song to us, in sanctifying thy Sanctifying Name without intermission. Wherefore also, thou commandest to be loved, not only from the whole Soul, and whole Spirit, but also from the whole Heart, and with all our Strength: So that the Prayer that is Spiritually framed, and naked Worship, do even exclude that which is Verbal, which is unexperienced of the attention of the Mind.

Bestow on me, O most beloved Lord, that I may suggest that thing to my Neighbours thy Servants by similitudes. An Organist hearing a new Tune or Song, doth not presently, at first, play it without difficulty: his Soul doth in part indeed perceive the Sound, but his Fingers (which are as it were the Framers of Sounds, even as his other Members are the Formers of Words) do not so fitly follow, neither is it granted unto them to attain an absolute perfection of the Song, so speedily, quickly, and distinctly. He beholding indeed the Organ Table or Book, doth presently play it: to wit, his Capacity being wont to carry his Fingers towards it at the first sight of the Book; but that Song being composed according to the Laws of Musick, but not turned into a Table, he as less accustomed thereunto, doth the more difficultly play it; seeing a Table is accustomed to be first composed out of the Musick, for his Spirit before he plays: But as yet with a greater difficulty and rarity, the Table and Plat-form of a Lute, is extemporarily expressed in the Organ, or that of the Organ in the Lute. There hath not seemed unto me to be an unlike reason of the first conception of the Soul, as of a sound as yet crude or raw; and the Mind desires to have it reduced into Words or Writings, through defect whereof, not a few do stick in a good object, the which by reason of an undistinct Mind, vanisheth without fruit. But moreover, I perceive, that the first Idea of the Soul doth follow an accustomed instinct of the Mind, whereby it being even there polished or corrected, is perceived by Words or Writings: but indeed, whereas man being from the beginning, seasoned with the property of his Mother Tongue, doth obtain it as incorporated or inspired; and besides is wont to communicate unto his Mind and Mother Tongue, his Cogitations which depart into Meditations, Languages, or Writings, it seems an inconvenient thing, and a Wonder to the Soul, to endow an object of the first conception (being decyphered in the Mind by Words in the Mother Tongue) besides the inbred Custom, with a forreign Idiom or Dialect; wherein the under-

Understanding labouring by changing the Dialect, it over-shadows, weakens, and weakens it self, and also doth alienate the pure and plainly Spiritual Conception of the first object. But in very deed, the object of every first Cogitation, departing into Words, I have certainly found to be alwaies first had in the Mother Tongue; even in a man using none but the Spanish Dialect, who also heard a Spaniard; he being mortally wounded, and weak of Mind, spake many things, but in Italian, and being called on in Spanish, scarce understood.

I have likewise seen a Germane that was sick, sitting, or lying, (even as they placed him) like an Image, who never was capable of replying unto things asked him, neither did he understand what Words either his Wife, or any one of his Sons did pronounce; in any other than in his own proper Germane tongue; when as notwithstanding, within the Walls of his House, he alwaies used the Italian and French Tongues: Yea, and which more is, he being a little after freed from this waking Coma or Sleep, was scarce perswaded to believe the same.

And so, O Lord, I have cast down this poor Dedication of my Book in my Mother Tongue, before thy most high Throne, to wit, the Song of my object, which dammage of my Neighbour, thou hast not disdained to let down into me. Unto Thee be all the Honour!

I now proceed to signify to my Neighbour the wretched ignorance of the Heathens, whereby thy sick People have been hitherto seduced by the Universities, and so, miserably slain, the Precept of the Prophet uttered in thy Name, nothing hindring it; Thus saith the Lord, do not ye teach like unto the Gentiles.

Wherefore, O Lord, grant that my Soul may retain the gifts granted unto it, unto thine Honour, whereby I may imprint thy Goodness, a part of my Debt, in this Path of Death, on my Neighbour. Be thou unto me every Hinge, who alone art the Way, the Truth, and the Life: This is the one onely thing which it becometh us to love. Thou my Angel, Defender, and Intercessor, who beholdest the Omnipotent Good; Beg in my name, that which is wanting unto me, insist thou in the steps of Raphael (the Divine Physitian) who carried the Works of burial of the dead, performed by night, unto God; thou diligent Curer, carry thou the present Work, performed in the night of my darkness, unto God, that man may not hereafter, be thus killed, nor so soon undergo Death: Offer up this my Work, before the holy sacred Trinity, whereunto I dedicate it! So act thou for the Glory of God.

THE
Translators Premonition
TO THE CANDID
READER.

FRIEND,

Hoever thou art, know thou, that as the things contained in this *Work*, were not at the first, written by the honest, conscientious, most learned and judicious Author, from a vain ostentation, or to draw out Peoples minds after the *Tree of Knowledge*, whereby they might have something to admire at, and talk of, to deceive the time (as they say) and so to neglect the Tree of Life which is appointed for the healing of the Nations: But rather that man having eaten of the forbidden Tree of Knowledge of good and evil, and having experimentally known evil (whereby he is expelled from the Tree of Life, which before the Fall was his food, and is become captivated in Understanding, Will, and Affections, from whatsoever may be known of God, either within in the light of his Immortal Mind, which by Creation was in the very Image of its Creator; or without in his visible Creation, in whose invisible Power and Unity all things consist and subsist) might come to know himself and his Creator in the Unity of the Spirit, and all other things in that Unity: so neither was it translated into our Mother Tongue to any other end, than that naked and simple Uniform-Truth might appear, to the confounding of that which appears to be Truth but is not; but is masked, various, compounded and confused; whose false Plea is Antiquity, and chief support, the self-ends of Ambition and Avarice.

It is a saying in the Scriptures, *He that is first in his own Cause, seemeth just, but his Neighbour cometh and searcheth him.* Also, *That the rich man is wise in his own conceit: But the poor that hath Understanding, searcheth him out.*

How truly these sayings may be applied unto this Author, with respect to the Schools both of Logick, Natural Philosophy, Astrology, Theology, and in particular those of Medicine, both as to the Theorie and Practick part thereof, I may singly refer the judgement thereof unto him that hath the least measure

The Translators Premonition

of true Understanding, without any further enlargement; because such a one, who with the Lamp or Candle of God being lighted in him (whereunto the Author bears his Testimony in opposition to blind Reason, in the Chapter of the searching or hunting out of Sciences) is able to see in his measure, eye to eye, *or as Face answereth to Face in a glass*: Nevertheless, for the sake of some simple-hearted Reader, who though not yet come unto such a discerning, so as to separate the light from the darkness, may notwithstanding, truly hunger and thirst after the knowledge of the Truth, I shall speak somewhat.

That the Schools of the *Gentiles* have had their time, is well known, wherein they have become vain in their imaginations, exercised themselves in *vain Philosophy, and opposition of Science, falsely so called*, as the Apostle Paul observeth, and whereof he admonisheth the true Christians, *as to take heed they were not deceived by it*.

And although Histories mention, That at the coming of the First-born Son into the World (whom all the Angels of God were to Worship) the Heathen Oracles at *Delphos*, and elsewhere, were struck dumb and gave no Answer, as a sign, that all Falshood, false Voices, deceitful Juggles, vain Inventions, &c. were to give way and be abolished at the appearance and rising of the Day-Star, and Sun of Righteousness, on and over the Earth; the Star of which Star the Wise men of the East saw, and by its direction came to Worship the Child, laying down all their wisdom at his Feet; for a lively token, that all true Wisdom and Science was to be received from him, *in whom all the treasures of Wisdom and Knowledge dwell*; and not by the dim and dark illustrations of mans own Reason and Discourse: Yet such hath been the subtilty of the fleshly Serpent, that under the pretence of owning and professing the Name of Christ, he hath taken up in his, *Paganish* means and instruments to build withal, calling the dregs and dross of the *Minerva* of the Heathenish Schools, Hand-maides unto Divinity, and true Principles of Medicinal Science; but this counterfeit fineness can no longer dazzle or blind the eyes of those unto whom God hath given eye-salve that they may see, and gold tried in the fire; for such are able to discern an Image from a Man, and true and pure Mettal from counterfeit Coyn; so that the abettors of such deceits shall proceed no further, but their folly shall be made manifest to all men; forasmuch as that which alone tends to the healing of the Maladies of mans Spirit, and the breaches there, which Sin hath made, is seated in the Invisible Life of God, as is applied thereunto as a Remedy, by the virtue of Christs Blood alone, who is *the Lamb of God, and a quickening Spirit*: And so also, seeing that which tends to the Healing of any Disease Radically, in the Body, is the Internal Faculty or Property, seated in the first Being of Medicines; which by due preparation being unclothed of their gross corporeal cloathings, are made fit to be applied by the Wisdom of a true Physitian unto the Archeus or vital Air of the Body wherein its Diseases Radically dwel, & not in Relolleous qualities, nor in feigned Elementary complexions, as in the following Treatise is clearly manifested: And so that nothing can be a true Handmaid unto Divinity, or Medicine, but the gift of him who is Lord of the whole man. And that which gives the Children of Wisdom, an ability to justifie Wisdom her self, and a Power to judge and condemn the Wisdom of this World, whether it be conversant about things Visible or Invisible, things Temporal or Eternal, is the Son of God, by whom the World was made, and all living Souls created, even the everlasting Father of Spirits, who hath committed all judgement to the Son, in whom they all subsist, who filleth all in all: this Son of God is the Eternal Eye of the Father, which runs thorow the whole Creation, *beholding the evil and the good*; it is that Eye which knows and sees the

the

To the Candid Reader.

the essence and frame of all things : it doth not behold any thing in its essence to be evil ; because every thing in its Essence and Being is good, and that, because it is one, and true ; but that which is double, varie-form, seeming, or false, that it sees to be evil, and that is the fleshly and sensual apprehension and desire in man, which vailes or taints his Spirit of Understanding and Will, that they are not able to give a right tincture, or rightly to apply themselves unto Objects intelligible or desirable, whereby irregular and evil effects, in Word, Action, and Conversation, do visibly appear : even as an Engine, whose innermost Spring or Wheel being defective, all its other parts and motions are out of order ; for the Body is but the Shell or Vessel of the Spirit. That eye being opened in Man, or Candle lighted, so far as it is lighted or opened, makes first to behold the evil and the good, and the evil from the good in a mans self ; and so far as he doth this, he is truly said to know himself ; for he consists of darkness and light, till by a holy war, the light hath comprehended the darkness : The truth of this is not to be disputed, for it hath been experimentally known, and witnessed by all the children of light, in all Generations.

This being granted to be true, it must needs be accounted the Christians *Epæche* or stop of Time, from whence he is to reckon upon his progress in all, or any other true Knowledge or Science whatsoever ; *For as the Father knoweth all things, and no man knoweth the Father but the Son, and him to whom the Son will reveal him ;* So, as the Son revealeth the Father unto any one, according to the measure and manner of his revelation, other things are known also ; as in the bulk of Unity, wherein the Almighty compasseth all things in the hollow of his hand, and swallows them up as out of sight ; which is the knowledge of the blessed ; so also as from this blessedness, a reflex act goes forth with a pure clear ray or Beam, towards particular things or objects, apprehending or looking thorough them, according to their particular natures and properties placed in them by the Word, the Creator : This kind of knowledge, is not the fruit of the forbidden tree, but of the Tree of Life ; for Life is its Root, and Love is its Branches ; first extended towards God the Creator, in the measure of whose Image, the Understanding doth apply it self by an intellectual act, unto the particular thing understood, and so in that Image adoring his Wisdom and Power therein. Secondly, towards the Neighbour, in directing such a particular knowledge or knowledges, unto the use, service, benefit, necessity, and health of the same, in this mortal Life.

Now to bring this home unto our present purpose ; such a Root and Branches do I judge, yea and feel to be, of this present Authors knowledge : For although he was as to his visible profession of Religion, a member of the *Romish* Church, after the Tradition of his Fathers, and so in that respect, was in the captivity in some things, which may well be accounted hay, stubble, &c. Yet as *Daniel* was a true *Israelite*, yea and a man of an excellent Spirit, though in *Babylon*, who saw over the *Babylonians*, and was hated of them even to the death, for his Wisdom, and Uprightness ; So may it be said of this Author, who by a Divine gift from God, in the light of sound Judgement and true Understanding, out of love to his Neighbour, hath as a Modern, come after the Schools, the Sons of Antiquity (as they would be accounted) and so searched them out in their principles, that being weighed in the Ballance of true Science, they are found lighter than Vanity. Neither hath the Errors of the Chymical Schoole in divers particulars, escaped his Pen : yet well observe thou, (whatever carping self-ended partialists may say) that the Author doth as well build up his own, as pull down others Doctrine.

I do not speak this from a desire to boast in another mans Lines, or to glory

The Translator's Premonition

in man, or as thinking him infallible even in the Myſteries of Nature, for that were not only to derogate from Gods Honour, to wrong my own Soul, but alſo to wrong the deceased Author himſelf, while I ſhould ſeem to own the gift of God in him; for I find him in his Writings wholly renouncing all vain glory, ſelf exaltation and ambition, or to receive honour from man, as knowing that every good gift deſcended from the Father of Lights, and ſo that he had nothing but what he had received.

Therefore whoſoever thou art, who deſireſt to be bettered in the reading and conſidering of this work, ſee that thy mind be ſomewhat ſtayed and compoſed out of the giddineſs, lightneſs, and wantonneſs; for Wiſdom is too high for a Fool: Deſire above all things, and in the firſt place, *the Fear of the Lord*, for that is *the beginning of Wiſdom, and a good underſtanding have all they that do thereafter; So may Wiſdom pour forth her Words unto thee, and give thee knowledge of wiſe Counſels, Secrets, and of witty Inventions; but the wicked ſhall dwell in a dry land:* For Friend, believe me, the hour is coming, and the day haſtens, wherein all things ſhall be ſeen and enjoyed in the root which beareth them, *that all the Pots of Jeruſalem may be holy to the Lord, and holineſs ſeen even upon the Horſe Bridles: and this was the Word of the Lord to Daniel concerning the laſt times; that he ſhould ſtand up in his Lot at the end of the days; and that before the end came, many ſhould be purified and made white, and tryed; but the wicked ſhould do wickedly, and none of the wicked ſhould underſtand, but the wiſe ſhould underſtand: ſuch are thoſe who depart from evil, and abide in Gods fear, as I have ſaid.* And as for the manner of rendring the ſenſe of the Author, I have been careful and faithful according to my ability, to make him as plain to be underſtood by my Country-men as the Work would even poſſibly bear; therefore have I not ſtudied for abſtruſe words, or high flown language; For *Veritatis ſimplex oratio*; the ſpeech of Truth is ſimple or plain; alſo that might have proved not a true genuine tranſlation, but a ſubverſion to the Readers apprehenſion: It is not Words but Things, not Names but Natures, not Reſemblances but Realities, not Sublimities but Simplicities, that the Sons of Truth do ſeek after. Yet *the Jews ſeek a Sign, and the Greeks ſeek after Wiſdom*, but all in the wrong part; and ſo wherein they think to be Wiſe, they become Fools: So that I may truly apply that antient obſervation, unto the ſeeming Wiſe and Learned of this Age,

Satis eloquentiæ, ſapientiæ parum, abunde fabularum audivimus.

Enough of Eloquence, Fables abound,
But of true Wiſdom, little is to be found.

Wherefore be ſober, be watchful, be humble, be gentle, be courteous, be impartial, wait in ſilence, and deſire of the Lord God, in Faith and Love unfeigned unto the Truth, as Truth, that thou mayeſt receive it as it is in Jeſus; for there is no Truth out of him; *For thou Lord in the beginning haſt laid the Foundations of the Earth, and the Heavens are the work of thy hands; they ſhall periſh, but thou ſhalt remaine, and as a Veſture ſhalt thou fold them up, and they ſhall be changed, but thou art the ſame (Truth) and thy years ſhall not fail.* So the God of Peace and Truth be with all the upright in heart, who ſeek the Lord with their whole hearts, in this backſliding generation; and with every truly honeſt-hearted Reader of this Book; that it may answer the laborious ends of the Author, and the poor endeavour of thy real Friend.

John Chandler.

TO THE
FRIENDLY READER
S. D.

FRANCIS MERCURIUS *Van HELMONT*, A Philosopher, by that ONE in whom are all things ; A Wandering HERMITE.

Had at sometime concluded, by reason of many wandering thoughts, that it would be hardly obtained of me to Write any thing to be published for the use of my Neighbour, in this present Age; seeing that I have hated feigned, varie-form, vain, and deceitful words, which the Men of the World do thirst after. But now I being constrained by the Reasons and Letters of many moderate wise Men, out of divers Kingdoms and States here and there, who perswaded me that I was devoutly engaged by the pledge of Health, to commit all the Writings of my deceased Father unto the Press; and to annex thereunto, when, and after what manner he closed his Day: Also in what State or Condition he left the aforesaid Writings: And moreover, to supply those things which were lacking, for the vindicating the Life of Man-kind, from many Errors, Torments, and Destruction. It is [That] which hath extorted from me, to leave all other things, and thorowly to review the aforesaid Writings; which being finished, I gave up my self to hearken to their Calls: I suspended my former purpose, discoursing in plain and most simple Words, the following Narrative, in my Mother Tongue, according to the tenour of the fore-going Dedication of my Father, the which I also imitate, by following him in the very same intent thereof.

The Death of my Father, happened on the Thirtieth Day of the Tenth Month, *December*, of the Year one thousand six hundred forty four, at the sixth hour in the Evening, when as he had as yet, a full use of Reason, and had first required and obtained all his sacred Solemnities and Rights. His Life it self was his Disease, which remained with him seven Weeks, beginning with him after this manner: He at sometime returned home in hast, on foot, at Noon, in a cold and stinking Mist, which was a cause unto him, that when he endeavoured to write a small Epistle of about fifteen lines, or did indulge himself with too large a discourse, his breathing so failed him, that he was constrained to rise

up

The Preface to the Reader.

up, and to draw his breath thorow the nearest Window ; whereby a Pleurisie was provoked in him, at two several times, from the which notwithstanding, he restored himself perfectly whole ; yea the day before his Death, he being raised upright, as yet wrote to a certain Friend of his in *Paris*, there being among other, these following words ; *Praise and Glory be to God for evermore, who is pleased to call me out of the World ; and as I conjecture, my Life will not last above four and twenty hours space : For truly I do to day sustain the first assault of a Fever ; by reason of the weakness of Life, and defect thereof, whereby I must finish it.* The which accordingly followed, after that he had bestowed a special Benediction or Blessing on me, the which I esteem for a great Legacy. I do not here more largely extend the property of his Disease, by reason of the straitness of time ; seeing that I am besides, to make mention of him, in my Compendium, from all things unto the one thing, the which I endeavour (God willing it) to publish in a short time.

A few days preceding his Death, he said unto me ; *Take all my Writings, as well those crude and uncorrected, as those that are thorowly expurged, and joyn them together ; I now commit them to thy care, accomplish and digest all things according to thy own judgement : It hath so pleased the Lord Almighty, who attempts all things powerfully and directs all things sweetly.* Therefore attentive Reader, I intreat thee, that thou do not at the first sight, wrongfully judge me, because I have taken care to have the more Crude Writings Printed, as being mixed with the more Digested ones, those not being Restored or Corrected : Know thou, that the desire of promoting this great and laborious Work, hath been the cause thereof ; at length thou maiest experience, that the desirous Reader was to be by all means satisfied no less in this, than in the aforesaid Writings, and then thou wilt judge, that I have well and faithfully performed all things, seeking nothing for my own gain ; the which shall more clearly appear by this my Preface.

I call God to witness, that my Desire (unto whom it is known) doth extend unto the help of my Neighbour : Wherefore read thou, and read again this Writing, and it shall not repent thee for ever : for I tell thee in the height of truth that I have published these things from pity alone, as taking good notice, that men by reason of their own Imaginations, are so little careful of or affected with, the safety of an Eternal and Temporal Life.

Stop your antient in and out-steps, enter ye into the Royal path Eternal, dismiss ye those innumerable by-paths, which I my self have with exceeding labour and difficulty thorowly beaten, in seeking whereby I might come unto the knowledge of the Truth ; endeavouring in the mean time, to find out the ordination of all created things, and their harmony, and that by all the more internal and external means, which I was able to imagine. I then bent all my Senses, whereby I might make my self known unto Wise men so called, hoping at length, to find some Wise Man, not learned according to the common manner, in all places where I should passe thorow (which I might call Nations :) of whatsoever profession or condition they were, I spake to them according to their desire, that I might joyn in friendship with them by discourse, and according to my abilities, I imparted unto them the whole cause : by this and other means I touched at many clear fundamental Knowledges and Arts ; all which, I here advisedly pass by : And when I understood, all and every of them, to be onely the esteemed workmanship of a great Man, I discerned, that by how much the more a thing was absurd, vain, and foolish or frivolous, by so much the more it was exalted, and respected or honoured ; the which servitude I perceiving, became voluntarily averse thereto, as being one who did prosecute plain simplicity.

I de-

The Preface to the Reader.

I descending, ascended unto essential and occult or hidden properties, and for my aid, the understanding of some Latine Books seemed to be desired; to this end, I read over diverse times the New Testament, in the Latine Idiome, and the Germane, that by that means I might in a few days, not onely understand the Latine stile, but also, that in the aforesaid Testament, I might find the perfect, and long wished for, simple, one onely and Eternal Truth and Life, which the one thing (to wit God) doth onely and alone earnestly require, and is averse to all duallity or plurality; So also, whatsoever God hath created, he created all of it, in that one, and by that one thing, otherwise he had not kept an order.

And by how much the more I knew this amiable, free, and one only thing in all things, and did enjoy it; I addressed my self to a quiet study: I was outwardly cloathed with simple or homely raiment, and for the more inward contracting of my mind, as also for curing thereof, I acted many things known to God alone, as also for the preservation of my health, and increasing of my strength, I lived soberly for many Years together, I also abstained from fleshes, like as also from Fishes, Wine, and Ale or Beers; and that so far, that I incurred the contempt and disdain of my Kindred, who upbraided me as I conjecture, from a good zeal: What unwonted thing doth he again begin? He renders himself unfit for every condition and function, as well Ecclesiastical as Secular: He will at length become mad, when he shall no longer find any novelty for his Delight, or shall adiect himself to Magical Arts, or shall attempt a new Herefie: It is become with him, as with other wise Mens Children, as to persist in obstinacy.

Others moreover, redoubled; His Father is in the fault, for he hath rashly educated all his Children, he admitted them from their tender years, unto the Art of the Fire: This man being now become foolish, hath lost the opportunity or occasion of happiness; when *Isabella Clara Eugenia*, the Infanta of *Spain*, received him, and appointed him for a noble service with her Nephew the chief Cardinal, he refused it: it were better he had died instead of his Brethren, some good might have been expected from them; this man is serviceable for no employment: If he gapes after studies, let him submit himself to his Teachers, as it is the manner of others to do; or he is to be iaduced to marry a Wife, who may shake off these strange things from him.

On the contrary, others retorted; This is too late, replying by a mock, he is a Philosopher, he is too stubborn, he is no where seen except in the company of most unconstant, strange, and uncouth persons, of whatsoever profession and imployment; he will also incur a misfortune, for he knows not how to dissemble, he spareth none, neither great nor small, when he discerns that which is unjust; we are now dejected from all hope, he must needs be reduced unto wants, for he hath yeelded up all his Patrimony, both that which he did possess, and what should have fallen to him, unto his Sister; and moreover, as joyful, he hath departed hence, far from home, as shewing that he is never to return; Who ever remembred the like! He must needs undergo some changes, notwithstanding, it matters not us concerning what, so that he be not to be accounted foolish, so as to cast off his old dreses, except better, and more certain ones should supply him.

Conjectures fail us, seeing that he hath entred into these things without our counsel; let himself also look to what the end will be; when he shall stand in need of us, let him be accounted as a stranger.

After that I had quietly, and joyfully overcome these, and many other chances, I forthwith devised of the following course or process of unburthening my

The Preface to the Reader.

my Conscience, the which, at my Importunity, a Man unknown to the World, fearing God, proposed unto me; the chief Heads whereof, I will deliver in a Compendium, by Questions and Answers, the subsequent whereof shall at some time hint out more, than is manifestly declared in the precedent Answers; the which is done to the intent, that the Reader might likewise in the mean time, somewhat earnestly endeavour, and that it might be manifest unto him, that the aforesaid answers do abound.

At a certain time, a certain Man called a Friend, came to visite me; whom, among other things, I asked, whether he did as yet remember his promise made unto me, of administering some things to be joyned unto my Fathers Work, for the further instruction of the courteous Reader? To which he answered; Minde Brother, I thorowly weighing and meditating of thy Words all the night last past, and also the new and unheard of deliberation of *Mercurius, Trismegistus, Poimander*, my Lamp being extinguished, and natural Nourishment being first for some time withdrawn from the Body, whereby I might wholly be at leasure in the inner Man; hereupon, when I had sustained a great swooning fit, I am made to see (the use of my Eyes being suspended) from a certain Light, transparent, weighty, thick or dark, and compacted created Bodies, in their beginning, middle, and end, and I my self also piercing my self; and at the very moment of the Vision, I was found placed in a clear, living, circular, double Chair or Pulpit, wanting a Foundation, being embracingly enlightned (toward its Beginning) by the Stars, being engraven on every side with a circular Letter, which some do call *Zenith*, others *Nadir*, the which also by its aspect spake unto me: *Hear, See, Understand, and talk thou with one in all, and all things in one: The time hath appeared, that all the Blind may see, and all that see may remain blind: Follow ye me, and I will make manifest unto you, my illuminated Lights or Stars: my most stable Heart is created old and new, which is hung up for every man as a prize, being as it were a thing unknown by an expresse quality; proceed ye, earnestly endeavour ye, ye may reach the bottom of my necessary Body, together with all its durable, quiet, and acting Members; which parts are entire, praising their Creator singularly and universally by their Effects, who hath made me perfect, that I might help thee, and such as thou art, in the moment of necessity; for I am subjected to thy service, and am nothing besides.*

I hearing these things, it was manifest that they were truths, and at that very instant, I saw the Prize hung up, whereat I being as it were over furious, uttered these words: *Thou art a young Man, as also thy Children which shall be born of thee, for thy Brethren are like thee, who are equal unto thee in age, thy Body was created most clear, ponderous, exceeding well compacted, and conspicuous, thy one-two, or single-double colours, are skie coloured and red, which do contain all the Colours of the Universe, and the which colour hath transchanged thee into black darkness; thou being a white and red Virgin, shalt bring forth unto him even ten Children at every birth, with the unblemishing of thy Virginity; for truly, thou, and thy Children do constitute a Light, whose Parts are entire, neither heat nor cold, and not any the most sharpest Sword, shall loosen thy bond; for the Sun is thy Father, and the Moon thy Mother: Therefore here thou all things as not seeing them, and see thou as not hearing them, and speak thou within in the silence, that all things are in one; then shalt thou know a double co-united one thing in all things, as neither shalt thou be able to dissolve, as neither to knit the Eternal Band, without loss of time.*

These things being spoken, a great horroure invaded me, and I soon converting my self unto those like unto me, I there saw an innumerable company of Men of all sorts of Nations, learned, and unlearned, wise, noble, and ignoble, young Men, together with old, who all were divided into strife among themselves

The Preface to the Reader.

selves, for the knowledge and science of the Truth; I well perceiving the ground of this Division, attempted by my wish, to prepare my self for the implanting of a mutual Concord.

First, I observed that a certain little Book, being a part of another to follow after, entituled, *Opuscula Medica Inaudita*, or, *Unheard of little Works of Medicine*, had in part raised this discord, the which had recalled the more young, godly, studious, and other Reverencers of the Truth, out of the long and obscure night, into the dawning of the Day, that they might believe, that a Light more perfect, nor hitherto learned, did remain, from whence this dawning did shine unto them; and by how much the more thorowly they looked into the aforefaid little Book, by so much the more they were glad, because they found therein, the promises of the coming of a more perfect desired Light; it being that which did so heighten their Mind, that a certain one of them, did not fear publickly to propose this Parable with a shrill Voice, unto some eminent famous Professors of Universities, and Christians, yet ungrateful ones, with Interrogatives, and Admonitions: It is no wonder that these our Words do seem the more hard to the Flesh, seeing they are spiritual, whereof the Flesh cannot give Judgment; even as he spake, who had never looked against the Light, by reason of the sickness of his Sight, and when he saw the least Light, he detested it, relating among other things, that it was the worst of Poysons, because it brought an intollerable Pain upon him; so that therefore, he remained incurable, who could not through his obstinacy, endure any mention of curing, seeing that he loved Darknes before Light, and so was made a Son of the same Darknes. Some of the Professors took notice, that this similitude was uttered concerning them, and not knowing how to moderate themselves, as being possessed with fury, they flung out this; Ye Novices, and seditious Seeds-men of Heresies, ye ought to be burnt alive, together with your Abettors. These Words being spoken, they in a rage rushed forward toward the House of the Senieur Professor, and there called a company together by night, that they might foresee among themselves, what might be taken in hand, whereby this new Doctrin might be subverted: The Patron of this Family was a most covetous old Man, as also very aged, who after he had received them all with a solemn Salutation, began his Speech, saying; My fellow Brethren, and my sworn Sons of our Profession, it is very well known unto you, that our Doctrin hath been firmly established, whereof nothing is to be doubted, seeing it is so antient, nor ever hath sustained any adversity of the Nations which might brand it with a blemish: In our dayes, it is least of all to be granted, that by this Schismatical Doctrin, it can go to the wall, or that the glory, esteem, and the things suggested by us, eminently appearing in print, can altogether perish; for the preserving of them, let us earnestly endeavour with all our Might; by which deed, we shall render our selves immortal unto our successors, and shall bear away a solemn reward for our famous Deeds; let us be unanimous, then shall we perform many things; I will first produce my Opinion: If any one of us shall be adverse to our purpose, let him be imposed upon with a Fine (by a plurality of voices) agreeable to every ones Wealth or Ability; I as the first, will bind my self to this, by a Copy; and as soon as any one shall come to be fined, let the money rebounding from hence, be laid aside for the use of suppressing the Enemies; and least discord should grow among us for the future, and that we may fitly reach our seasonable conclusion, it is needful, that all things which shall here be dispatched, be committed to writings; whom they presently obeyed in every thing, and committed it to the Effect; besides they incited him, that he might proceed as he had begun, saying, Both these

c

Propositions

The Preface to the Reader.

Propositions are just and equal; for truly, all of us have by this our Doctrin, gotten our wealth; And so also, it is meet and just, that the Goods gotten thereby, should have respect unto our Doctrin, and should defend it, whereby we may as yet attain to be more wealthy. The aforesaid Seniour hearing these Words, with a very grateful, and pleasant Countenance and Gesture, adjoyned thereto; I hold it most exceeding necessary; and also to procure other Wealth of the Schools, that they may joyn with us, and enter into a mutual Covenant, because the Matter toucheth them also; which being obtained, we will presently implore the Magistrate, to condemn that seditious little Book to the Fire, under a further injunction, that they which should make use of it, shall pay the punishment of Goods, and Body. Secondly, it should be diligently endeavoured by us, that we presently setting upon the one only Son of the Author of the aforesaid little Book, by subtilty, who possesseth his other Writings, by an hereditary right, should promise him a certain summe of Money, some third man interceding, as for a congratulation or restoring of his Fathers Books unto us, the which we should allege, were to be committed to the Press, as feigning to take part with his Father, that by his means, we at least might understand, where he might keep them in secret, whereby we might obtain the same to be burnt by the Fire; for when these Books shall behold the Light, we shall suffer greater things; neither should any other Remedy avail, than procure a Book to be set forth in the Authors name, containing perverse Doctrin, or hellish Arts, and to disperse it throughout the whole World: also that this thing might the better succeed, the said Heir should be taken out of the way, least he should hinder our purpose: all which things, it is lawful freely to commit without Sin, seeing that we are able to demonstrate, and confirm these things, by a received custom, and Doctrin of very many famous Writers, of a certain predominating Order. These sayings being ended, he intreated the chief Doctor next unto himself, no less to endeavour with all his might, to abolish so gainsay-ing a Doctrin, and to preserve the profitable one; whereto he as the second, to the first, replied, he was at this command. He was otherwise, an honest and sincere Man, who had secretly recalled many miserable Sick from the Grave, through his Integrity; whereby, as oft as opportunity gave leave, he chastised Fornis or Sorts of Remedies, from the quantity and violence of his said Collegiates: This Man also understood of, and expected the present coming of *Elias* the Artist, the which he vehemently desired, and had learned many Years before, from a certain studious Man of the Brethren of his Profession; and besides, he excelled in the strength of reason, and in a firm health of Body, who dying, seemed to know something beyond the common sort of Men.

He once before his Death, went to minister to the Poor freely out of Charity, he wrought many Works of Mercy in the Hospitals and Prisons, until he brought back with him, a common Disease, who presently sent for his Professours, who much rejoiced, that he himself would make tryal of the Fruits of their professed Theory: these Professours calling a wonted counsel, withdrew Blood largely from him, they gave him Purgative Medicines to drink, and so they plainly prostrated his strength: But it opportunely happened, that his remaining strength, and youth, overcame the Disease; he appeared to have received his lost strength, whereby he was confirmed, that Professours and Licensed Persons, were true Physitians, reckoning from their relation, that he had deserved or was in danger of Death, and that he owed his Life unto their Torments: hence they took of him a double reward, but not according to their deserts. The young Man renewing his former pious steps, was the second
time

The Preface to the Reader.

time oppressed with the very same malady, and he hoped by their endeavour, again to escape the same cruelty; but alas, his spirit failed him, and from sound Reason, and a knowledge of the Truth, he cryed out unto this his Brother: It hath befallen me, as to all others, and it shall so long continue, untill Physicians so called, do in very deed feel and see this present time to be for Eternity; but now they forget the time past, believing that they possess the present time, they deny the time to come, seeing they cannot see that, and so they take no care for a longer Life; for they have never been destitute thereof, even as of any other frail or mortal good, whereof there is made a repairing, but they possessing one only Life, and loosing that, all shall be ended: It is a vain thing to employ ones self in Studies, when no necessity is urgent upon us: The Servant who ought readily to serve us, is beaten, which doth perpetually provoke this Man whom he shall name his Master, by all his qualities, he shall be ignorant of his thralldom, although all Men, except a few, are bound up by his Servitude, the which for the most part, deprives of Life both now and hereafter: I despair of a temporary Life; for they who are said to bring help, do want the knowledge thereof, and they are first constrained to obtain it by brawlings and discords, which will arise among them, through hatred and envy, wherewith those called Doctors or Teachers have never laboured, seeing they are but few, who by running up and down day and night, do excel in Wealth, whereby they scrape together an abundance of Money, as well among the Healthy, and Sick, as those that are dead; and so they might continue in concord, the which shall remain so long, until the last times appear, which thou shalt discern by that, when thou shalt see the number of Junior and Licensed Doctors of Medicine, so to increase, that they shall scarce have employment: The Seniors shall be offended with the Juniors and Young Beginners, because their dayly revenues shall be diminished, and because they shall find foreign or accidentary Juniors, being constrained to learn more sure Principles, for to get their living, to cure some Sick, whose like, being under their care, did undergo Death; which thing, the Seniors shall envy, wishingly desiring, that all the Sick-folks might die, unto whom the Juniors should be called: Lastly, they shall reproach them publickly before all the People, saying; *These wicked young Men do cure by Enchantments, they should of necessity, be forbidden to practise.* By these and the like means, they shall labour to subvert them, and and they shall offend God, that it may add courage unto other godly and industrious Juniors to perfect that, which they shall propose to the Seniors, in these Words: *When we have invited you, to suffer us publickly to cure some Sick of an Hospital, appointing a Prize or Wager for the benefit of the Poor, ye also to be solicitous or diligent on the other hand, and that they who had not answered the effect, should pay the reward thereof, ye have refused that thing; ye seek not the Poor, but [Give Ye] ye resemble Beggars in that thing, who disdain their fellow Beggars, and are unwilling that their number should increase; for they have a confidence in some rich Mens houses and places, where a larger bounty beset them for their deceitful Words and Tricks, that so they may leave their Arts, and these Houses to their Children for a Dowry; which very thing also, ye cherish in your Mind, but it shall have a bad success; because through this publick discord, which shall spring from Covetousnesse, that dayly Deceit shall be made known to the World, and they shall receive only true Doctors, who may be discerned by their good Fruits, and who shall imitate the steps of the Samaritan.*

These Words being finished, he felt his Life to fail; therefore, lifting up his eyes towards Heaven, he with sorrow subjoyned; *Oh most merciful Lord, abbreviate thou the term of Mans Salvation, and change thou the frail Doctrine of the Doctors.*

The Preface to the Reader.

tors their *Flesh*, into the natural or peculiar Love of the Spirit, that the Innocent may finish their Life to thy Glory: I pray thee oh my Saviour, do not thou impute my Death to the Doctors, hereafter, for an Offence; for truly they know not what they do commit; but vouchsafe thou to open their eyes, that they may assent to the truth, and that the People may publish those things of them, as in times past of holy Paul. Which saying being ended, he wholly committed himself to the Divine Will, and breathed forth his last Breath in the armes of this his Brother, who did alwayes ponder these Words aforesaid.

This Man in his turn, uttered these following Words: We are all of us, being Brethren in Christ, engaged to patronize the truth; the which, is not better perfected than by opposing, and defending: Hence we will prosecute two things; one is, that the strength of our Enemies may be made known unto us; the other is, that we may add more strength to our own, and so, that we may be the more confirmed in our purpose. After that they had heard all these Words, they compelled [him] to undergoe this charge, with the threatning of a Fine, for so much as he had taken this voluntary Office on himself: And he alleaged; I being the second of the Seniors, am desirous to be instructed by any one, in this difficult matter; I being a Servant of truth, do after some sort yield to the two former Propositions; but unto the third, I can in no wise assent, to wit, to subvert the aforesaid Books by interdictions and brands of Censures: for if we should endeavour that, we should act altogether rashly, we thinking to extinguish them in one place, should also again raise them up in a thousand other places: Men are no longer so ignorant and unwary, as in times past, when as all Examples or Patterns of religious obedience were published by favour: which thing is chiefly manifest in Printers and Booksellers, they making gain here and there, and it cannot be forbidden and hindered: Doth not the thing it self bespeak that? we need not go far: That Author himself, fet forth a Discourse, inscribed, Of the Magnetick or Attractive cure of Wounds, which was stoln from him, and about five hundred of them printed in Letters, by his Enemies; whereupon, they divulged three divers Books, in great number, of the Divines and Doctors of Medicine of all Europe, maintaining their Athiesm, consisting of blasphemous Censures, the which Censures they had easily collected, because they live in all Countries (under every kind of habit, and countenance of Religion) where Money, or Merchandise abounds; and these censorious Infamies, they did every where spread abroad in Temples, and other publick Places, whereby the little Book was made known, and was hunted after by every one: I have known many seeking to compass it at a dear rate, neither could they obtain it; for no Printer had any thing of it to be found, seeing that they kept it only to themselves, it being so often printed, only for the collecting of the Stripes of Censurers, they suffering the loss of above fifty thousand Royals, whereby they might overthrow the Author thereof. Moreover, because the aforesaid little Book or Discourse was approved of by some Wise, Learned, and Moderate Men, great injury was done to the Author; God foresaw otherwise, and blessed him that he should not be suppressed according to their desire: And so, in this restraint suffered from above, he published upon it, another little Book, instead of a forerunner, and this other principal Book was to follow after, that it may clearly be manifest, those Writings of his, are not afraid of a Censors Rod.

Fourthly, that the Authors own original Copy of his Book or Writings, in the Heirs Possession, should be by craft or prize, apprehended, it cannot be accomplished to be abolished by the Fire, before that it be printed: for I certainly know, that some disdainful Persons, have by sending a certain Book-seller

The Preface to the Reader.

feller before them; offered to the fore-threatned Heir, a thousand Crownes in hand, and besides, offering an Assurance of another thousand, on this condition, that he would deliver up all the Writings of his Father, which were in his Possession, no one piece being detained: the Heir smelt out the deceit, as being void of the desire of Money; he heard him spake, he asked him many Questions, he enquired into all things, and plainly confounded him, so that at last, he imprudently brake forth into reproaches, departing home with a vain Journey. These and many such like Attempts being acted, which the Heir hath had experience of, do breed in him a distrust, so that he only requires a preservation from him who aspireth unto those things, that he may not be deceived. Besides I have understood, if I rightly remember, that himself hath taken care to have those Writings imprinted by an honest and faithful Man, who will be diligent to sell them into all parts. Fifthly, to suborn bastard Books on the Author, containing strange and false Doctrine, that would be made manifest; for the reason of Invention, doth now every where plainly appear: besides we should so awaken the Heir thereby, and according to the signification of his name, he would so loudly exclaim, that it should be perceived by all, unto whom means should not be wanting, although he wants a Patrimony; for truly it is affirmed, and is the very truth, that he hath found *Elias* the Artist, and hath made him his familiar Friend, by help of whom, he shall propagate the Philosophy of *Pythagoras*, whose ultimate Tables he doth by unwearied Labour, dig up, with the signification of the Parent of the metallick Rod. The matter being thus, let us not provoke him, let us spare our Pains, and preserve our Charges or Expences; for if this Doctrine doth bear any evil intent before it, it will soon goe to ruine of its own accord; and if it descend from God, and we resist it, we could not satisfy our purpose, and we should spend our pains and costs in vain, bringing on our selves destruction both now and hereafter. When as all the rest of the Doctors had now heard these solid Reasons, they returned him great thanks, and esteemed his disprovement of what the other had said, for a decision of the matter; except the aforesaid Senious: this man hearing those things, through grief and fear, was smitten with an Apoplexie, and so died an exceeding sudden Death: his Sons cryed out with loud howlings or lamentations, his Neighbours were awakened, and resorted thither apace, being ignorant of what was done, they found all his Family exceedingly perplexed: Whither likewise, a studious Man approached, who had observed this rout, he presently sacrificed to his own profit; for when he saw all those Writings there laying up and down, and left, he taking them up, hid them under his Cloak, and presently withdrew himself: as soon as the day shone forth, he did his endeavour to read them unto every one of his Friends and Favourites, who spread it abroad, and made it known: Hence it was further spread abroad, that thou in digging, hadst obtained the Will or Testament of *Pythagoras*, and it was declared by the Supream Lord of hidden Treasures; this Lord did presently commit thee to custody, because thou hadst not brought forth the Testament of *Pythagorus* to light, the which ought not to be attained by theft, but by gift; the Lord appointed three of his Wise Men (the Seekers or Lovers of peculiar natural Science, whom many of all sorts of Nations and Conditions, yea and the great Ones of the World, did follow or defend) to go thither where thou wast detained, who thus spake unto thee; Be of good cheer, this sentence shall be to be sustained by thee, which our Lord hath brought upon thee, the which begins after this manner; By the command of thy Supream Lord, unto whom it is certainly known, that thou *Mercurius Van Helmont*, in digging, hast found a Treasure, which he had commanded to be enquired

The Preface to the Reader.

enquired after by his Subjects, by whom, thou being accused, and convicted by certain and full proofs, art condemned to Death, unless thou shalt bring forth that very patched and covered Testament of *Pythagoras*, and likewise shalt most fully discover, by what way and knowledge thou hast found that: These things being performed, a liberty shall be allotted thee throughout all his Empire.

Thou hearing these things with a sorrowful Mind, and being again refreshed with cheerfulness, didst certainly know, that by proceeding in denials, thou couldest not escape Death; wherefore thou answeredst, unto those that were sent in message unto thee, after this manner following: I intreat you oh ye Wife, like as also Prudent Sirs, if I can prevaile any thing with you, that ye mutually attest my thankful mind unto our Lord, for so clementious a sentence, wherewith he hath vouchsafed to prosecute me, and to demonstrate unto him, that I have imprudently retained that Testament, as being ignorant that it was to be delivered: I now prepare my self to preform it, together with all the Experience and Knowledge, whereby I have obtained it, and that indeed, unto whom it shall please our Lord, so that his Goodness may grant me the space of a whole Week, within which time, I am to satisfie our Lord, whereby I may re-obtain my liberty, according to the tenour of his Sentence, hoping that that will not be refused: For in very deed, and according to a just computation, I stand in need of two dayes, to wit, that of *Saturn*, with that of *Sol*, whereby I may with my self, begin and perfect every Enterprize, or that I may dispose of all things, in order, which in the following day of *Lune*, and so afterwards, in the whole Week following, I shall distinctly signifie: Whereto the wise Men answered, Oh *Mercurius*, we are instructed with a full Command from our Lord, by whose authority we condescend to thy Petition, as being supported with Equity; thou shalt perform all things according to thy own sentence, that the wise Sirs being not learned after the common manner, and moderate or courteous Men, may find no fault in thee, when they shall hear thee in the said day, or subject thee to examination and even as thou hast bound thy self to be kept in custody for thy own, and that an ample limited term of dayes, until thy promises are accomplished, we will alwayes remain with thee, for an enquiry into thy Conceptions, the which thou shalt frame in this two precedent dayes space. Thou rejoycedst in their Company; for whosoever he was that beheld them, gathered by their habit and gestures, that they were godly; for truly, their Countenance, did carry a divine gladness before it, and thou didst say unto them: Seeing that the day cometh, for the winning whereof, my obediences are not in the least to be contested, know ye, oh my wise Men, that I prefixed no time for the recollecting of my Memory, nor any the like thing, because I have no need thereof; but considering, that to day is the first day of the Week, but to morrow the last day, the Lords day, the seventh day, wherein he had finished all things, and wherein he had rested: It hath seemed meet unto me, to distribute and contain my Knowledge, according to the rate of the Dayes of the week; I beginning the future day of *Lune* one the sixth day of the week, after the custom of Mortals (for before God, all things are eternal and present) so that unto us, as unto Mortals, the first day may be accounted the last, and I beginning from *Saturns* day, to number backwards, have need of two and forty dayes for the fulfilling of the whole week, that which would stir up a weariness in many, through the largeness of time: In the mean time, I will briefly rehearse all things.

I *Mercurius*, being from my tender years, brought up by my Father in the select School of *Hermes* and there after some sort seasoned, my Spirit being
unquiet

The Preface to the Reader.

unquiet, was not content therewith, as desiringly desiring thorowly to know the whole sacred Art, or Tree of Life, and to enjoy it: Neither would I set my hands to Work, unless I could certainly understand this, from the beginning to the end. Moreover, I concluded in my mind, that through an improvement of the truth, I might be brought thither at the last, without the help of outward Instruction. I distributed with my self, all Creatures, first those External and Corporeal (as I may so say;) and then those Internal, Spiritual, and Corporifying ones; which Parts I did again refer or reduce towards and into one: I was not able to subdivide and know those Creatures called Corporeal ones, without the adjoyning of the Spiritual Corporifying ones: I beheld those with an unwonted Countenance; even as according to my Judgment, I had consequently placed all, in every one his own order, as being free from the anticipated or fore-possessed, false, and obstinate Opinions of the *Heathens*, who have never frequented Universities, as by this my unpolished Style doth sufficiently appear. Nevertheless, well observe ye, I utter no Saying in vain, but that it doth signifie something, and pertain to the whole.

My Spirit could perceive no delight or desire of study, in Temporary and Fraile or Mortal things; I did alwayes thirst and breath after Perfect and Eternal ones; I was taken up into admiration within my self from momentary necessary created things, and from hence on God, who created Heaven and Earth at once, the which the Prophane Phylosophers cannot apprehend: and they who desire to come hitherto, they must worship God by a firme Faith, with an humble Hope, and in true Love: then shall they obtain a perfect Knowledge of himself, and of all other Creatures, before their Beginning, in their Being, or Essence, and after their transchanging; the which I will more largely and manifestly make out, so far as may be done by Words, for the Temporal, and Eternal Health, and Preservation of the Soul, and Body, according to the measure of every ones Capacity, which all have not alike, nor had they: And that they might be the further holpen towards Salvation, God out of his Goodness, raised up *Moses* of the Prophets, who might be useful to them in a *Type* (which after the Dutch Language, is also as much as to say, Books) and by his Writings; to wit, in his first Book of Creations, which containeth all of whatsoever can be desired, the which I in part, as the whole, had sometimes learned by heart (according to *Jerom's* Translation) the rather, because it comprehends all things, which man in his Own-ness, Selfishness and My-ness, and the like Appropriations, cannot understand: For whatsoever God hath created, he hath created free, and at liberty by One, and in One: and he that arrogates that thing to himself, makes that very thing it self, his own, seperates himself from God, and doth in himself, enter into the way that leadeth towards utter Darknes: And as God is an Incomprehensible, Eternal, Piercing, and a Filling Fire, Light, and Glory, wanting Beginning, and Ending; such is he in the Men his Saints (*Hy-lichten*, according to the Dutch, is as much as to say, He shineth) in a co-united Love and Glory; and in the Godly (*Sa-lichten* according to the Dutch, expresseth, He ought to shine) he will be so, according to more and less or a greater and less measure: but in evil Men, who are Eternal in the Dark, and separated, he is also an Eternal burning Fire, even as it is said. Therefore, even as God is the Eternal Good (in the Dutch *Idiome*, it expresseth God;) so also, all whatsoever was created, he created Good: The first Man was constituted into Light, and Good, as being created of God; yet not united in Eternal Rest and Glory; but as being created after the Image of God, in a freedom of Will; the which is now become a Property in us, through the seducement and transgression of the Prohibition, and Admonition
of

The Preface to the Reader.

of God, in the touching and eating of Death, or of the Fruit of the forbidden Tree, which [*Hevah*, or *Eve*] the Mother of all Living, touched and ate.

Those called the wise Men, did speak unto thee; *Run thou not out so far, before we perceive, whether thou hast known thy self, and that thou hast told us what thy self art.*

Mercurius; I am a Man, created by the Almighty God, after his own Image and Likeness, possessing my Body of the Clay of the Earth, which in the Dutch Idiom is (*Litch-aem*) as if to say (a Vessel of Light) having obtained a Spirit and Soul from him; And one thing ought to be made of these, the Body, Spirit and Soul ought to be sanctified (*Hy-lichzijn* (he shineth) or Blessed, *Sal-lichzijn*) he shall be shining) but if not, the Vessel and Spirit must needs be damned.

Wise Men; We observe or take notice, that thou endeavourest to express thy self to be threefold, but not a Unite, and thy Spirit to be Darksome, or Lightsome, the darkening of it to proceed from the Flesh, which is earthly, deadly, and obscure; the illumination, or enlightning of it, it shall attain by the Spirit, by beaming in, emptying out, and subduing the Darkness: But we covet to hear, whether there be a third thing; because thou namest the Light of the Vessel, and a Soul; are there two diverse Lights, or at leastwise, do they constitute or make one Light, of one Light?

Mercurius; there is one only Eternal Light, Entirely and Eternally, Externally, and Internally in all Parts, because the Life Eternal, and the whole Eternal Part, was inspired into Man by the Almighty God, even as *Moses* testifies in the second Chapter of the Book of *Genesis*; *Man was made into a living Soul*; which Soul, made or constituted the seventh Day, as is demonstrated in the very same Chapter: *Therefore the Heavens and the Earth were perfected, and all the Ornament or Dress thereof: And God compleated Work which he had made, on the Seventh Day; and he rested on the Seventh Day from all his Work which he had made; and he blessed the Seventh Day, and sanctified it: Because therein God had ceased from all his Work which he had created, that he might make, to wit, Man into a living Soul.*

Wise Men; If this Light be the Seventh Day, what dost thou think of the Six foregoing Dayes, and of that which is extant in the eighteenth Chapter of *Ecclesiasticus*; *He who lives for ever created all things at once?*

Mercurius; In the Beginning, God created all things, the Heaven and the Earth, and whatsoever was created; the which *Moses* at the entrance of *Genesis*, compreheuds into the First Day, where he denotes the making of the other five Dayes, Saying: *In the Beginning God created the Heaven and the Earth, but the Earth was empty and void, and Darkness was upon the face of the Deep; and the Spirit of God was carried upon the Waters: And God said let there be Light, and Light was made: And God saw the Light, that it was good; and he divided the Light from the Darkness; And he called the Light Day, and the Darkness Night. And the Evening and Morning was made one Day.*

Infomuch that Man doth constitute the Sixth Day, which Dayes were distinct from each other, whereby Man may know himself, what he is, what he is to do, and what Power he hath, or may have by his Spirit, as a Man (not likewise as a Soul) over the foregoing Dayes, or created things, as it is found in the aforesaid Chapter of *Genesis*; *And God said, Let us make Man according to our own Image and Likeness; and let him bear Rule over the Fishes of the Sea, and over the Fowles of the Heaven, and over the Beasts of the whole Earth, and over every creeping thing which is moved in the Earth.*

Wise

The Preface to the Reader.

Wise Men :

Thou dost satisfie us, and besides, dost also over-signifie, that Man was the sixth Day, and that he seperated the Light from the Darknes on the first Day, which Light or Spirit, he called Day, and his Blood, Flesh, or Darknes, he called Night, which Evening, and Morning, constituted the sixth Day; and so consequently, the other five, although according to every ones peculiar Nature. But dost thou make no mention of the seventh Day?

Mercurius :

The seventh Morning, Light or Life, is the Spirit of God it self, even as was said: And therefore in *Moses* his description of the seventh Day, it is not expressed, that the Evening and Morning was made the seventh Day, as in the six precedent Dayes; and that for this Cause, because there is no Beginning, or Evening granted to be in God the Father, because he is he who [*Is what he is:*] but it is so accounted, because on the seventh Day, he inspired into Man his Face, the Breath of Life, and this man became into a living Soul; so that of Man, and the Breath of God, the seventh Day was made.

Wise Men :

From thy relation, we have fully understood the Beginning and Ending of the first Day, and of the sixth Day following, with the seventh Day not ended, that Man was conjoynly made into a living Soul: But we desire to hear, what *Moses* will have to be meant by the Word, *In the Beginning?*

Mercurius :

The Beginning is God the Son, by whom, in whom, and from whom the Heaven and Earth were created; as the Evangelist *John* doth most exceeding evidently testifie, in his first Chapter, in these Words: *In the Beginning was the Word* (which with the Dutch also sounds, *Woort*, that is *Fiat* or let it be done) *and the Word was with God, and God was the Word. This Word was in the Beginning with God. All things were made by him, and without him was nothing made. In him was Life, and the Life was the Light of men; And the Light shineth in Darknes and the Darknes hath not comprehended it. There was a Man sent from God, whose name was John. This Man came for a Testimony, that he might bear witness of the Light, that all men through him might believe. He was not that Light, but that he might bear witness of the Light. That was the true Light, which enlightneth every Man that cometh into this World: He was in the World, and the World was made by him, and the World knew him not. He came into his own, and his own received him not: But as many as received him, to them he gave Power to become the Sons of God, to these who believe in his name; who were born not of Bloods, nor of the Will of the Flesh, neither of the Will of Man, but of God. And the Word was made Flesh, and dwelt in us, and we saw its Glory, as the Glory of the only begotten of the Father, full of Grace, and Truth. John gives his Testimony concerning him, and cryeth out saying: This was he, whom I said; he which is to come after me, was made before me; because he was before me: And of his fulness, we all have received, and Grace for Grace: Because the Law was given by *Moses*, Grace, and Truth was made by *Jesus Christ*. No Man hath seen God at any time: The*

The Preface to the Reader.

only begotten Son, who is in the bosom of the Father, he hath declared him.

Wise Men;

Now we have perceived this Testimony of Saint *John*, that it contains every thing serving to perfection: but deliver thy Opinion unto us, after what manner thou art like unto *Adam*? and in what respect in him; and how thou hast proceeded from him?

Mercurius;

Before that man was made into a living Soul, God spake unto himself, as the first Chapter of *Genesis* witnesseth: *And God created Man according to his own Image* (which Image is God the Son) *After the Image of God created he him, Male and Female created he them. And God blessed them, and said, Increase and multiply.*

Which command was enjoined to *Adam*, in respect of his Spirit, and Humanity, but not as to his Soul: for this is Eternal and Immutable: So also, all his Parts are like unto him, whereof I also possess the whole: Now even as man was made of the Mud or Clay of the Ground; so also it behoves him to increase as other terrestrial living Creatures, by a growing and uniting, and eating of living Creatures, which Foods are required to die in the Stomack, and to be changed from their Substance, if they ought to be converted from a more vile Substance, into a more excellent one, or to be promoted by the Spirit of Man, unto a united Life, from which co-nourishing and increasing, my Vessel or Body, and Substance, I hold as *Adam* did: because I proceeded from him, after that he was made into a living Soul, as it is found in the second Chapter of *Genesis*: but for *Adam*, there was not found an helper like unto him: Therefore the Lord God sent a deep Sleep into *Adam*; and when he had slept, he took one of his Ribs, and filled up the Flesh in the room of it. And the Lord God framed the Rib which he had taken from *Adam*, into a Woman; and he brought her unto *Adam*: And *Adam* said, *This now is Bone of my Bones, and Flesh of my Flesh, this shall be called Virago or Wo-man, because she was taken from Man: Wherefore a Man shall leave his Father and his Mother, and shall adhere to his Wife, and they twain shall be in one Flesh.*

Wise Men;

Thou hast explained unto us, what thou hast been wholly in *Adam*, according to thy Spirit and Soul, and in *Eve* according to thy Body: likewise, that the Vessel hath received the Spirit, and the Spirit the Soul. Now we could desire to hear, in what respect *Eve* was produced by God out of *Adam*, and what the sleep sent by God into *Adam*, before he framed her, doth denote?

Mercurius;

Adam from the Beginning was perfect in his Essence, as being the first Man created by God, so his Spirit did shine thorow his Flesh and Vessel, and did illustrate it: even as now, the Light did illuminate his Darkness, and was able to subdue it, so it ought to excel and overcome the Darkness; because it was Internal, Stable, Eternal, and good in its own Essence; the which Spirit existing, *Adam* could not of his own accord produce his Like, without

The Preface to the Reader.

without Sleep sent into him ; for he persisting in his Essence, was without sleep, and because he had divided himself from himself, all his Parts had remained proper unto him, and again, had returned unto the whole into one, as soon as he had list, because by his Spirit predominating, he had divided the Body subjected unto it self ; which Parts were inwardly and outwardly enlightned, from his own Light, which gave an Essence unto all his Members.

But some may ask, how in the next place had it gone with *Adam*, if he had not eaten the Poyson from *Eve* ? It is answered, there had alwayes been in him a combating with his Spirit or Light against his Darknes, the which on the first Day God divided, of which two also Man was composed, even as the said Chapter sheweth, which is further explained at the end of the same Chapter, on the sixth Day, in these Words : *And replenish ye the Earth, and subdue it* : And when they had fought to the utmost, they had filled the Earth and the Darknes, with their Spirit or with their Light, and had so subdued it, that the former Darknes had been supped up, and co-nourished, which was his proper and one only Work, alwayes to be done and perfected.

But some one may further query, seeing in *Adam* the said Light being separated from the Darknes, had overcome the Darknes, as it was shewed to be by the very same Light ; whether or no, according to a spiritual returned or restored United Body, he had been entire and eternal in all his particular Parts and Members ? This being so, by that reason, he might have been divided into Innumerable, Eternal, and Infinite men, without the aforesaid sleep preceding ? I answer ; it is certain, that this Deified man, would have been entire in all his Infinite Parts ; likewise that all those Parts would again as one, have constituted one Entire Body : He having himself in such a manner, had been likewise to be one Deified Man ; he being reduced hitherto by his necessary strife, would by Grace in his Life, have enjoyed or rejoyced in the same, with Christ our Saviour after his Resurrection ; Whereby many such men might now have been begotten or brought forth ; and whereby, all also of them might have enjoyed that very same Grace, for which *Adam* was procreated, and whereby they might have attained it by that very same strife : It pleased the Lord God to send the aforesaid sleep into *Adam*, to shew, that he soundly sleeping, had not contributed any thing to the structure of *Eve* ; but she was now founded in this sleep by God.

Moreover, the curious might busily enquire, why *Eve* was framed of the Rib of *Adam*, but not of his Flesh ? I return an answer ; the former Man was *Adam*, the second *Eve*, made for his help, and conjoyned Procreation ; Now Propagation consisteth partly in Man, as in other living Creatures, by conjunction, or nourishing, as was said ; and it is further to be observed in all increase of created things in this World, before they are able to grow (because they consist of two things) that the one ought first to die, to wit, the Body and Form, which consist of Water and Earth, and do arise from the Light of the Moon and Stars, as of the Lights of the Night, every thing according to their different Nature, none excepted ; and that this might be perfected in *Adam*, the Lord God took a Rib out of *Adam*, which is a Bone, according to its being made in *Adam*, a Progeny of Veins (the which, with the Dutch sounds also, a Progeny of Vipers) which Bone is governed by the Moon, as shall be found, that when the Moon increaseth, the Marrow likewise of the Bones doth increase, like the Waters, and together with it doth decrease : It will further be found, that when Flesh is burnt in the Fire, it looseth that form,

The Preface to the Reader.

A Bone not so, yea that is so stable; that the Examiners of the goodness of Coyn do make their Crucibles thereof, wherein they melt and searh Gold and Silver: So that a Bone or Rib, is, and doth retain nothing besides the humane Earth, as it is a second Production in Man; like that of the Earth out of the Waters, so far it differs from the first and one thing. Wherefore *Eve*, as she was procreated from hence, she is likewise of a second and lesser thing, according to her Body, not likewise according to her Spirit and Soul; For these she holds from *Adam*, which are Eternal and Permanent, and a Part whereof *Eve* Possesseth, and all that, even as all their Parts, are Eternal, even as was said. Now in a further consideration or avouching of the Premises, thou shalt find, that Women do therefore suffer monthly Issues or Menstrues, serving for Propagation, because they ought to beget a man, as to the Body, in that respect as was said.

Wise Men;

We acquiesce; and moreover, through occasion of two Words, which thou from the Dutch Idiom, hast considerately produced, thou recallest two places of Scripture unto our remembrance; one rehearsed by the Evangelist *Mathew*, in the twelfth Chapter, where Christ saith to the *Pharisees*; *He that is not with me, is against me; and he that gathereth not with me, scattereth. Therefore I say unto you; Every Sin and Blasphemy, shall be forgiven unto Men, (Flesh) but the Blasphemy of the Spirit, shall not be forgiven. And whosoever shall speak a Word against the Son of Man, it shall be forgiven him: but he that shall speak against the holy Spirit, it shall not be forgiven him, neither in this Age, nor in that to come. Either make ye the Tree good, and its Fruit good; or make ye the Tree Evil, and its Fruit Evil: for truly, the Tree is known by the Fruit. Ye Generation of Vipers, how can ye speak good things, seeing ye are Evil? For from the abundance of the Heart the Mouth speaketh.* The other is mentioned by *Luke* in the third Chapter, after the citing of a place of the Prophet *Isaiah*, who saith; *And all Flesh shall see the Salvation of God. Therefore he (to wit John the Baptist) said unto the Multitude which went out to be Baptized of him: Ye Generations of Vipers, who hath shewn you to flee from the wrath to come? do ye therefore Fruits meet for repentance, and ye shall not begin to say; We have Abraham for our Father. For I say unto you; because God is able of those Stones, to raise up Sons unto Abraham.* Which two Words are also repeated in these two Texts, not badly agreeing with the signification of the Dutch Word; and thou shewing unto us by all thy demonstration, that the Serpent so called, which seduced *Eve*, and her Spirit, was certainly her own Flesh and Blood, which desired the Fruits of the forbidden Tree, and spake to her Spirit for that end; so that the name of Serpent, is not only accounted the Serpent, but as well the Serpent, a living Creature, as a Man, according to the Flesh, the which is also, moreover seen in the Infancy, or Old Age of a Man, or when the Spirit is weakened, that he is and doth become a Serpent.

Wherefore, after God had committed unto man the dominion over the living Creatures, over all the Earth, and over every creeping Animal, which is moved in the Earth, this last Dominion is the greatest, whereby he ought to work his own blessedness, that which thou shalt more cleerly make manifest from the Text, as soon as leasure shall permit; for now we hasten, because half of the second day of those prefixed, hath soon passed away, therefore proceed thou and hasten, and declare unto us the difference between thee and

Adam

The Preface to the Reader.

Adam, when he was to strive against his Darknes, whereby he as well as thou might have subdued it.

Mercurius ; In no other thing, besides that Darknes was increased in man, by the touching of the Fruits, and eating of the forbidden Tree ; in so much that Darknes holds the prize against the Light, and doth now possess it, even as in *Adam*, the Light in *Adam* did possess his Darknes, and did illuminate it before his Fall.

Wise Men ; How comes this to pass ?

Mercurius ; This hath come to pass, through a Fermenting or Leavening, Contagious, Darksom, and Deadly or Destructive eating.

Wise Men ; What wilt thou insinuate thereby, explain thy self by Similitudes.

Mercurius ; As Darknes was in the face of the deep, before that the Spirit of God was carried upon the Waters ; in like manner, thou shalt find a certain Vessel, or place, which being shut up, or hoary and filthy, doth even in a very little time, render all that which is cast into it, alike stinking or rank, and further to infect it ; neither doth any thing of the first more principal Ferment and Filthiness depart. Moreover, that it may be demonstrated, that this filthy place is also darksom, is well learned by those that pertain to Wine-cellars, who being desirous to know and experience, whether a Hogs-head be hoary or filthy, or no, do open its mouth, and by an End do let in a burning Candle, and when the Vessel shall be clean, and infected with no Muck or Filth, the Candle being let down athwart it, will remain burning, until its own begetting Vapour doth choak it self : but if the Hogs-head be filthy, the Flame or Light, cannot pierce through the Orifice of the Hogs-head unto the thickness of the Wood. Therefore it manifestly appears, that the darknes doth also uncloth or discover it self, and make other things darksom, just even as the Light doth operate, and that, when the darknes doth overcome the Light, or the Light overcome the Darknes : These and the like Darkneses, must needs be before all Light ; and by how much the more stable they are, by so much the more stable also, is the Body arisen from thence. Now it is further to be noted, that as a temporal Light doth illustrate out of it self, one thing more largely than another, according to their stability, magnitude, or increasing ; in the like proportion and manner, the darknes powers forth its Beams out of it self, as was shewn : also as a burning and consuming Fire, can by its Light, enflame, burn, and stir up many Seeds into a growth or increase, according to the rate of their more stable Nature, that which I take notice of, thou shalt evidently perceive by this Experiment : it is seen and felt, that by how much the nearer a Fire is kindled, by so much the more it shines or enlightens, and heats : now this heat and brightness is one and the same thing, as long as it is in the Fire, as by a collection of those hot beams through the help of a certain burning glass, may be proved, whereby the hot beams are again collected, and are made like unto those which exist in the Fire, to wit, hot and burning ones : now when we permit a temporal, dispersed and decaying Fire freely to burn, we shall discern by the Light which shines forth through the Fire, that other created Bodies are burnt at diverse distances from hence, to wit, in the nearest
Body

The Preface to the Reader.

Body, the more stable and combustible one, and as the beams are diffused, so far also the heat is diminished, and will enflame the less stable created bodies: The reason is, because that which is soon made, must needs also have that which soon perisheth: wherefore cold and moist Regions do bring forth larger Fruits than hot and dry Jurisdictions; yet are they less durable than others which are less hot, because their Light which is in them, is more divided, and that as well in Bruits as in Men; Men of moist Coasts or Climates are homely and big, neither can they undergo so much heat, as Men which live in high, dry, and hot Countries, as also the thing it self doth moreover testify: Yea thou shalt find that even dead Carcases which are slain by a violent Death, even as Histories do declare, and we are able besides, dayly to experience, when a slaughter hath been made, or shall be made of men who had gone out of cold and watery Coasts, to wage War against those of the more hot Provinces, that the Slain on both sides might be discerned a long time after, because they of the more cold Regions did sooner putrifie, these waxed dry, and remained surviving, these did longer endure entire in the Heat, because their Balsam is more durable than that of the other, even as they contain more or less of a moist Matter, or do partake more or less of a Night Light, and they which are the more destitute of that, those do more rejoyce in a day Light: Now even as the Sun is a perfect, and the greater day Light; so the Moon being the nearest Planet unto us, is a perfect Night Light, which are perpetual in their Essence, and likewise do render those Bodies perpetual and durable, which are born, and renewed by their help. Furthermore, as there is one only Sun, and one only Moon, their created Bodies, no otherwise than those like unto them, may be compared thereunto, they being one only and also perfect, as Gold, which the Phylosophers have called *Sol*, and Silver, *Lune*, and the other five Metals likewise according to the thing brought forth, after the rest of the Planets, wherein they have rightly done, and have delivered the Truth, because, those one only Bodies are perfect; the Fire cannot hurt them, they remain stable therein, Gold lives in the Fire, therefore the Phylosophers have marked that, with the name of *Salamander*, the which now is falsly accounted for a living Creature: A temporary and fraile Fire, possesseth its Fire, only in part as was said; but the Sun is a perpetual Fire and Life, and can live only in that which is like it self, the which also must needs be a stable Body: And as there is a temporary body in all things, except in these two aforesaid which are like them, and do wholly participate of them, in what respect, bodies ought to be returned, into their first Essence; by the same reason likewise, the Light ought to be returned unto its Original; for a frail or mortal thing cannot reach unto a perpetual thing: Furthermore, the stable Darknes must needs be present, before the Light, wherein the Light is raised up; but if this Darknes be perpetual, the Light also may perpetually dwell in it: first, according to the Spirit, and then, according to the Soul; which Spirit, seeing it is Eternal, doth illuminate Eternal Darknes, and the Darknes grows together or increaseth into Light, and is made Silver, which is twofold, constituting a Body in the Flesh and Bones of Gold, which is threefold: Now as the Sun is a great day Light, so it overcomes the Moon, and silver is altogether converted into Gold, by that; the other five Earthly Planets, may be transchanged and brought thorow unto a perfection like unto that of them, because they also are Nocturnal Lights. Further, we must know, that there are many innumerable Minerals, mutually differing like as do the Stars from each other, all which do expect their Perfection, and some of these can more easily and swiftly

The Preface to the Reader.

ly attain unto their last Perfection than others. Gold and Silver, how finally soever they may be divided, they may be re united without loss, because all their least Parts are entire and perpetual: Notwithstanding, they may be rendered Mortal, because they have not as yet co-met or con-joynd into one; but this Death cannot begin of and from themselves, neither by reason of the Gold, nor of the Silver, because they are stable Bodies.

Now some Lovers might ask, after what sort, or by what means that might happen? I reply; After the same manner or means, whereby it happeneth in all created things, whereby also it happened in *Eve*, through an increasing of the Darknes, which draws its Original out of the principles of their Bodies, as was shewn; yea the Darknes may so grow up, that it may convert the whole Spirit into Darknes: but if that *Lune* or the Spirit of *Sol*, doth call the Soul or Heat unto its aid, before it be subjected and overcome, the Spirit shall be strengthened, not as it was before its Corruption, but by this strife and victory, it shall be so strong, and the Spirit thereof shall be so greatly multiplied, that it is able to render ten of the imperfect Brethren, stable; but this Spirit hath not by this contention attained unto a liberty even entire, and an Eternal Union; but it ought so often to repeat this conflict, which shall always more and more increase, according to the increase of the Spirit, and Darknes, until it shall come unto the utmost, and can suffer no more; and the watery Body or Darknes shall be plainly consumed, and then it is a pure, everlasting, united, and double Light, which will illustrate all things, without damage and diminishment, and will be able to perfect all its Brethren into the likeness of it self, its own Virtue being retained; and when this thing doth happen in *Sol*, the Light of *Lune* is changed, and supped up into *Sol*; so that it is equally made an Eternal, United, and Trine *Sol*, that which is the last in Eternity (out of Man:). And hence it may be demonstrated, that the Evangelist *John*, in the third Chapter of his *Revelation*, doth use the same Similitude, saying; *I exhort thee to buy of me Gold tried in the Fire, that thou mayest be made rich, and to be cloathed with white Garments, and that the confusion or shame of thy nakedness may not appear; and anoint thou thine eyes with a Collyrium or Eye-Salve, that thou mayest see. I whom I love, do reprove and chastize: Be ye therefore zealous and repent. Behold I stand at the door and knock; If any one shall hear my voice, and shall open unto me the Gate, I will enter in unto him, and will sup with him, and he with me. He that shall overcome, I will give unto him to sit with me in my Throne, as also I have overcome, and have sit with my Father in his Throne. He that hath an eare, let him hear what the Spirit saith unto the Churches.*

Wise Men; We rejoyce that we understand from thee, and do know the shining and quickning Light; likewise the effluxing, acting, fermental, contagious, and mortal Darknes; whereby we understand, how *Eve* hath touched and eaten of the Fruits of Darknes, and that she became darksom and contagious from thence; through her effluxing Darknes, she delivered that which she had eaten, as she who was to do that very thing in *Adam*, who did eat of the same: In like manner, through the diversity of the shining Light, from the Darknes uncloathing it self, we understand, after what manner the Ministers or Servants of God, are able by the Light, to perform external, and everlasting Works, as to remove Mountains, restore Sight to the Blind, hearing to the Deaf, to raise the Dead; and likewise on the other hand, how Evil and Dark men, are able or powerful only in committing or acting Works which are seperated, and mortal or noysom, through their Darknes issuing out of themselves

The Preface to the Reader.

themselves: We have perceived also, that the Tree of Life, was placed in the midst of the Garden, and likewise the Tree of the Knowledge of Good and Evil, which we may collect out of the second and third following Chapter of *Moses*. We also apprehend the Tree to be Good, but its Fruits to have been Evil: besides, now we know this Tree, together with *Paradise*, from thy Words, and the same from the second Chapter of *Moses*; *But the Lord God, had from the Beginning, planted a Paradise of Pleasure; wherein he placed the Man, which he had formed. And the Lord God, produced from the Ground, every Tree that was Beautiful to behold, and Sweet to eat: also the Tree of Life in the midst of the Garden, and the Tree of the Knowledge of Good and Evil. And a River went out from the Place of Pleasure, to water the Paradise, which was from thence divided into four Heads: The name of one is Pison; he it is which runs about or encompasseth all the Land of Havilah, where Gold is bred; and the Gold of that Land is the best.* Furthermore, we also conceive of this which is found in the third Chapter; *And when they had heard the voice of the Lord walking in the Paradise, at the coole Air after noon day: That which is further explained in the nineteenth Psalm of David; The Heavens declare the Glory of God, and the Firmament sheweth the Works of his hands. Day unto day uttereth the Word, and night unto night sheweth Knowledge. There are no Languages, nor Speeches, of which, their voices may not be heard: Their sound hath gone out unto all the Earth, and their words into the Borders of the Circle of the Earth. He hath placed his Tabernacle in the Sun: and he as a Bridegroom proceeding out of his Bride-chamber, hath rejoiced as a Gyant to run his race or course: his going forth is from the highest Heaven, and his encountering even unto the highest part thereof, neither is there he who can hide himself from his heat. The Law of the Lord is unspotted, converting Soules: the Testimony or Witness of the Lord is faithful, giving Wisdom to the little Ones. The Righteousnesses of the Lord are right, making glad Hearts: The Precept of the Lord is lightsom or cleer, enlightning the Eyes. The Fear of the Lord is holy, remaining for Age of Age. The Judgments of the Lord are true, being justified for their very own sakes: they are to be desired above Gold, and much Pretious-stone; and are sweeter than the Honey and the honey Combe. For thy Servant keepeth them, in keeping them there is much reward. Who understandeth his Faults? Cleanse thou me from my secret Ones, and from strange Ones, spare thy Servant; If they shall not have dominion over me, then I shall be unspotted, and I shall be purged from the great Fault: And the Speeches or Oracles of my Mouth shall be such as may be well pleasing: and the Meditation of my Heart, alwayes in thy sight, Oh Lord my Helper, and my Redeemer.* We have also known that mortal Man might reach to the Tree of Life, and enjoy it, when he shal be a Cherub; and he may be made one, as *Moses* witnesseth in the third Chapter of *Genesis*; *And he said, Behold, Adam hath become as it were one of us, knowing Good and Evil; now therefore, least happily, he stretch forth his hand, and take also of the Tree of Life, and eat and live for ever. And the Lord God, sent him out from the Paradise of Pleasure, that he might labour the Earth from which he was taken: and he cast out Adam, and placed before the Paradise of Pleasure, Cherubims, and a flaming Sword, and that which turned about to keep the way of the Tree of Life.*

Seeing that now, that two days limited space is slipt away, and that thou art to be left by us in a short time, we first covet to hear, because thou art instructed in the four lesser orders, whether likewise, thou dost ambitiously seek the other three, or to be promoted into a Doctor of Medicine?

Mercurius; The Priesthood is a great office, and requireth many things,
now

The Preface to the Reader.

now especially they ought to answer concerning many things, and to be perfect, when they will rightly discharge their duty, the which I never should dare to undertake but constrainedly.

The Doctorship of the Art of Medicine I deservedly shun, because the Professors of the same, do for the most part foster other mens opinions, and do the less follow the Truth: But I shall intreat God, that it would please him, to grant me daily to perform his will, with all my might, even as long as Life shall last.

The prosperous Wisemen of the Night, did bless thee with their Prayer, exhorting; proceed thou in thy purpose, and act thou, that thou mayest procure (through the mediation of the day of *Saturn*, in the day of *Lune*, by the day of *Sol*) liberty to thy self, as was said. And next, we commend thee to the supplication of our followers, who have charged, accused, and convicted thee, that thou mightest bring forth all the aforesaid things, or secrets to light: Speak to them, and hear them gently, as they shall observe all things which thou dost put in practise; for this two days space, we have stood to our Commission.

For these things, thou having performed thy due thanks towards these wise Sirs and Masters, didst say unto their followers; Ye lovers of the Truth, ye that are most honoured, together with ye that are lesse honoured, noble, ignoble, and ye who are present, I have known none of you apart (although I have been pricked forward by you (because your countenance is now veiled unto me; Know ye, that I do humbly beseech you all, known and unknown, not unpleasantly to receive my ready poor labour, and courteous affection, which devotes it self readily to serve all and every one of you with all its might. Which words they hearing, did aloft testifie their acceptation, and a great number of those that were known, did begin to undo their veils, some did read written letters unto thee, others sounded out Hymns in honour of thy Father and his Writings, they being sent unto thee, whereby they might be prefixed unto thy Fathers Work: This applause ceasing, after thy thanks being most perfectly performed, thou didst go on; I have known many of you, some by sight and talk, others by a great celebration, Letters and Verses, which were taken from me by the Count of *Giline*, when in my absence he had spoiled my Castle, where, amongst the rest of my household-stuffe, he had discerned the aforesaid Books, Writings, and Hymns; all which, together with his *Galenical* paultry Physitian, he was not able to endure to survive; this destruction I lament, as the one onely cause, that they could in no wise see the light: Whereupon thou didst wish them all Prosperity and health in the Lord, saying, I will from your earnest desire, commit all things that have been rehearsed, unto the Press.

All which things, after that my intimate friend upon urgency, had declared unto me, I contained in few words, and did shew them unto him; the which being seen, he counselled me to divulge in Print, subjoyning; if any one shall desire more things, so he be fit for them, I shall never be wanting, but will serve every one more fully according to the thing begun or brought forth in him. Follow me, I walk thorow the whole World.

A N

ACROSTICK

Upon the Great PHILOSOPHER,

John Baptista Van Helmont.

Ncomparable Work (beyond the reach
O f humane praise) which justly doth impeach
H uge Heaps and Volumns, of large ful-cram'd sheets ;
N icely compos'd, where subtile Learning meets,
(B orn up, by lofty-winged Fame) which can
A scend no higher now (since LEARNED VAN
P res'd into th' Croud) but (as attached) must
T ake Sanctuary in despised dust,

(I nevitale dis-esteem and shame
S urprising them) whilst, onely, HELMONT'S NAME
T akes hold of meriting Transcendency ;
A dvancing by the hand of Truth, whereby
V irtue, unvails the blinded eye of Vice ;
A mbition, Cruelty, and Avarice,
(N otorious Crimes) which with prevailing force,
H ave long continued on the World a Curse ;
E nt'ring by Ignorance and Sloth, whence all
L ame, and imperfect Sciences did crall ;
(M ustring, like Weeds, a multiplying Birth)
O re-running the whole surface of the Earth,
N one, knowing how, those Errors to unmask,
T ill, Painful HELMONT, undertook this Task.

JOHN HERMAN.

A PRO-

A PROPHECY

Concerning the

AUTHOR.

Expressed in a POEM.

1. Medicine before Hippocrates, hath appeared naked and wandring about.
2. A saying of Hippocrates, inviting her unto the Cities.
3. She having admired, answers to Hippocrates.
4. The Praise due to Hippocrates.
5. Hippocrates the first of Physitians, after what manner he manured Medicine.
6. Galen gave an ornament to her tongue, he nourished her not, therefore she grew not.
7. The Arabians have done the same thing.
8. The followers of both these Sects have done the same thing hitherto.
9. Paracelsus unhappily endeavoured ambitiously to compass the Title of the Monarch of Secrets, and Prince of Medicine.
10. Medicine despiseth Paganish attire.
11. She desireth a Looking Glass that she may become the clearer by a reflex Light.
12. The Book of the Author, shall serve those that shall succeed, for a Looking Glass.
13. Medicine unfolds her own and the Authors Destinies, by a Prophetick Poet.
14. Medicine praiseth the Authors Studies.
15. The Prophet declares the wished Fruits of his Labors.
16. The Judgement of Medicine concerning the Book of the Author.

He doleful'st Daughter of a high born Birth,
By chance doth wander up and down the Earth,
In places strange, among wild Beast so fierce,
And spitting her own Wishes, doth rehearse
Then her Misfortunes: blames the Powers unkind,
As cruel Gods: she blames them in her mind,
Through troubled sense, and straies with ire, too rife,
Whose cause of wandring was the cause of grief.
Thus here's a double slaughter; for she knew
Her wretched Brother did not Death eschew:
But perished by vengeance from above
Of th' scorching flame of iracundious Jove.
This Epidaurius, while he boldly brake
The iron Statutes of three sisters make,

Medicine. I

Æsculapius.

A Propheſie concerning the Author.

Is ſaid to periſh by *Ethereal fumes*.
 From hence, uncertain error ſtraight preſumes
 To walk in doubtful ſteps; from hence proceeds
 Much tears from cheeks, beclad in mourning weeds.
 2 Hippocra- Couſ ſaw her wandring fortune, who when ſeen
 tes. Did love her ſtraight, whoſe beauty pleaſed him;
 Becauſe twas em'lous of the ſnowie Roſe,
 He ſpeaks unto her thus, Here's I ſuppoſe.
 My Nymph, the Mayden Druides ſuch are,
 And jolly rout of the God Corniger.
 For why, thy preſence halloweth theſe fields
 It hallow's them: which lofty fairneſs yields
 A comely grace unto the Grecian Queen.
 But what delights thee to viſit I ween,
 Valleys of Mountains? what the hilly tops
 Affimilated unto ſtony Rocks?
 Do not the City Pallaces thee pleaſe,
 With lofty Roofes, built up for Princes eaſe?
 Art thou not pleaſed with the multitude
 Of Citizens, men with great fame endu'd?
 For a more tender life, apt habitation,
 Is it not better in thy eſtimation?
 And to enjoy a more ſublimed ſtate,
 Th' unlearned rout may vilifie thy rate:
 Mean Peaſants with their teſts of ruſtick name,
 And little houſes, much diſgrace the ſame.
 3 The comely Nymph, was now aſtoniſhed,
 To ſee the look, majeſtick grace of head,
 And geſture of this noble man that ſpake.
 Straight from her purple cheeks all tears did ſlake,
 And no complaint eccho'd, with mournful ſound.
 She beam'd her ſtarry lights upon the ground
 Which was ſo green; and utter'd certain Votes
 Of joyfulneſs co-mixt with merry notes.
 She in a little moment meditated,
 Touching the words which he to her related,
 And ſuch reſpondent answers ſhe began,
 To render unto Couſ, the old man.
 I am well pleaſ'd with theſe thy words, thou art
 One of the mortals which affect my heart:
 My proffer ſhall be like a gift to thee:
 4 With thee I'll dwell; through thee, I'll make to flee
 Both Plagues and Poxes; yea and all Diſeaſe,
 When't ſhall but ſee thee, ſhall be ill at eaſe.
 The bright Aurora, whereby Cynthius hill
 Doth riſe above the waters, and doth fill
 Its drowned Horſes in the weſtern ſtream:
 Yet ſhall thy glory climb more high, ſuprem
 In every Kingdom; yea thy praiſes hie,
 Shall gently touch the lofty ſtarry ſkie.
 Poſterity hereafter ſhall declame
 Thee th' only Medel'-maſter of great fame,
 Nor ſhall there be a fewel for thy praiſe,
 5 Whereby it can it ſelf more highly raiſe:
 While fatal Goddeſſes ſhall break thy fate,
 Thee, living fame ſhall plainly celebrate
 Throughout the World. Couſ returning due
 Thanksgivings for ſo great a gift; (in lue)
 Upon the naked Goddeſs doth beſtow
 Such gifts as theſe: the Nymph as white as ſnow,

A Propheſie concerning the Author.

He doth array in linnen clean and fine,
 Which doth ſurpaſs white Lillies in their prime,
 With ſnow beſprinkled. Whether Apollo roſe
 Whether his Chariots hot to rince he choſe
 I th weſtern Ocean, yet his golden hair
 Ne're ſaw the like, with which it might compair.
 Medicine remain'd long with ſuch trimmed grace,
 The firſt ag'd Fathers did her thus embrace :
 'Till five ages after, Galen came
 Wholly to deck her, not to feed the ſame:
 For he beſtowed on her, garments ſil'd
 With Tyrian die, the which a hem unſkil'd
 As being writh'd with many knots, adorns
 His neat gay bubbles, of his glistening horns
 Of rings diſtinguiſh : his fair flags beſpread,
 Alſo enrich her Virgin daughter head.
 Next cometh Avicennas as the glory
 Of the Sabæan Nation : and the ſtory
 Alſo reports, that he ſpent all his time
 In decking her with robes as gay and fine.
 After which two, did many moe ſucceed
 In their vaſt number, yet in very deed,
 They were ſuch men who acted nothing more,
 Than t'garniſh coats which thoſe had made before.
 And finally, from the Helvetian coaſts
 Comes Paracellus, and he proudly boaſts,
 Himſelf to be the Monarch of the flock,
 Saying he was the Goddeſs very ſtock.
 Yet ſhe contemns their glistening gems, and eke
 Their pretious Jewels hanging on her neck :
 Thoſe help not Goddeſſes ſhe ſaid. Beſide
 Ornaments breathing forth the ancient pride
 Can bring no help, and that brings greater wrong
 Which hath the more of Art, it ſpent upon.
 To what end are your thouſand robes ? I cry ;
 And oſtentations of Luxury ?
 But certainly, this vain laborious toil,
 Doth not become my lofty Goddeſs ſtile :
 What ! to have ſought out ornaments alone,
 For many hundred years forepaſt and gone :
 Woe and alas ! it may be ſhame enuff,
 T' have watch'd ſo hard for faulty triſſing ſtuff.
 And would it might be lawful but for me,
 My comely countenance once ſer to ſee :
 For ſhould I not in glaſs, appear more fair
 Unto my ſelf, than now my judgements are ?
 And is my Beauty now beheld indeed,
 If Goddeſſes be Judges of my weed ?
 And do all men prove of my Majeſty ?
 But haply they do fear (oh Nymph) I ſpie
 If thou ſhould'ſt ſee thy face, thou mayſt deſpiſe
 All, and wouldſt live alone by beauties guiſe.
 If thou belov'd Narciffus haſt not ſeen
 Thy proper figure in a well to gleen,
 The crime, of water being look'd into,
 Would not have prov'd thy death thee to undo.
 But he was mortal I a Goddeſs am,
 God's Daughter, doing, what I deſire can :
 But he alone what the Goddeſſes would.
 Who gives to me a glaſſe ? I un-controul'd

Require

A Prophecie concerning the Author.

Require a glass, than which I'll shew more clear,
And it all to be-freckled shall appear.
Who gives to me a looking-glass? But stay
Thy just and mournful notes (Oh Nymph) I pray:
For loe there's one who doth provide that mirror,
Which will direct thy visage, mark'd by error.
John Baptist will it give, who drew his name
From Helmont, whom Brussels his pleasant dame
Hath nourish'd in her bosom. But if this
Be true, which of a Sp'rit departing, is
Reported, from one vessel into another
To enter; then I do protest, moreover,
That I (most great Hipocrates) do find
Thy very Genius in this Authors mind.
Thy imitated form within this glass,
Thou wilt admire, whereto disease (alas)
Death, and the Destinies do greatly stoop:
Old age no longer with its wastful look,
Shall snatch away the wonted comely grace,
Nor oldish wrinkle be in ancient face.
Nor henceforth in a Labarinth reflex
Shalt thou be interrupted, or shalt vex:
Because a straight way is made manifest,
From every by-path where there is no rest.
The Nymph said to the Prophet, that the God
Of Heaven hath determin'd with his Rod,
To scourge the World with unaccustom'd griefs,
Throughout its circle, that mankind's beliefs
(which is a wretched rout) may fixed be
In this, how great ignorance they do see,
In Med'c'nal Doctors of the common sort.
Choice ones, he would have famous of report,
Indeed by their withstanding of the new;
And barb'rous number of Diseases' crew.
And on the other hand, that vulgar ones
The cruel murderers of many sons,
He would they voluntarily decay,
By a discharge peculiar, in that day.
For every one of them sticking among
The beaten words of his own masters tongue,
Thinks that a touching of art Med'cinal
Is of that Art, the very top of all:
While they proceed by circuits or by rounds,
And do restore afresh their Parents grounds:
And into new Centuries them compose:
Therefore they have not durst, or have not chose
To walk in Co-us steps: for why they thought,
The Healing Art could be no further sought.
But what will mortals do, accustomed,
Now by this Med'c'nal law to be misled?
And suffer all things each in his own skin?
The cred'lous multitude still pressing in
The fixed footsteps of its antient train,
By 'ts own deceit (alasse) is sadly slain.
Long Academick robes (for Cities health)
Nor babbles hallowed by the Common wealth,
Were not as yet deposited, while hee
The Author (young) requir'd with instanc-ee,
Our bride-beds, swiftly running (to those ends)
Through devious rough ways of old Fathers pens.
Indeed

A Propheſie concerning the Author.

Indeed he had procur'd unto himſelf
 Chief friends, who many pray'rs on his behalf,
 Did poure abroad unto the God above ;
 And whereby he through ſuppliant words (from love)
 Might nakedly behold ſick bodies plight,
 As Couſ old by h's pray'rs, had had the ſight.
 He paſs'd through many years with various coſt ;
 His buſie members with ſore labour toſt :
 Whether clear Phœbus drave his ſhining Carts,
 Or Cynthia fair did ſhine i'th' brightſom parts
 Of Heaven. He knowing of mee Alchymie,
 My abſtruſe heart (his houſhold ſervant I)
 The inward ſecret privy Chambers, there,
 Have not lain lurking cloſe, beyond his Sphere.
 He ſought her favour great, by many gifts,
 And by ſtrong prayers utter'd with humble lips ;
 That ſo at length ſhe might our love procure,
 And joyn with us in ſacred marriage ſure,
 Of grateful bed. He with a reſt-leſs breſt
 Poured forth 'plaints, and ſorrowful cheeks be-dreſt
 With luke-warm ſhowers. He would not that the great
 Governour of the ſkiee Olympick ſeat,
 Should from his Throne diſmiſs his deprecations
 As being fruſtrate through deaf acclamations.
 And thou prophetick Poet, this relate :
 Promise, and things ſhall follow 'f greater ſtate.
 Now whatſoere Diſeaſe or grief ſhall light,
 To cure ſhall be of one and equal weight.
 A dowry ſure, I am ordain'd to give,
 Unto the Author for his Labours hive :
 That I a Woman worthy of ſuch a Man,
 May be conjoyned in bride-bed and ban.
 And he both bodies ſhall aſſociate
 In ſacred bond of love. Do thou relate,
 Such joyful meſſages to humane kind
 As theſe : No ſad contagions thou ſhalt find
 Of any malady, but ſuch a one,
 Hath here confer'd a Med'cine for his mone.
 The Plague, the Queen of ſickneſſes, the Gowt
 Shall flee ; the Stone ſhall be expelled out :
 Aſcites watry Conduits ſhall be bor'd ;
 And thin-jaw'd Phthiſis ſhall be well reſtor'd.
 And whatſoere diſtempers, Eve ſo bold,
 In humane generations did unfold,
 After that ſhe, not knowing what ſhe ded,
 Drew weapons on her own and husbands bed.
 Now therefore let my judgment of this glaſs
 To th' Book, as for a ſign of wedlock paſs :
 So the bride-miſtriſs of the marriage bed.
 (But ſoft, before our Poeſie be ſped)
 Three R's occur. R, notes the antient
 Auſonia. R, Pelasgia Continent.
 R, finally, an Hebraiſm doth denote,
 And Banks of witty Dædalus betoke.

THE

T H E Authours Promises.

I Will shew the Errours of the Schooles, about things which they have rashly judged to be the fundamentals or ground-works of nature; afterwards, in the decay of nature, I will shew the defects, or diseases unknown to the Antients: to wit, that they do not arise from the co-mingling, fight, contrariety, or unequal tempering of the Elements; nor also from the qualities, which they feigne to be the ~~it~~ and proper to the Elements. Wherefore, that vain are the meditations of Complexions, as well in temperate, as in intemperate bodies. I will also teach, that the four humours are frivolous, and that whatsoever hath hitherto been attributed to them, hath been devised by the Heathens; and of these, the unhappy or evil spirit, to the destruction of mankind. To wit, that the composition, connexion, qualities, effects of humours, and the diseases that are dreamed to arise from thence, are meer fictions: also that the Lessons touching laxative Medicines, supposing the Elections or separations, with drawings, and lessnings of humours, are false. Indeed, that vain hopes, uncertain healings, dangerous experiments, in so great a sluggishness of ignorance, have not constituted the art of Medicine: but uncertain conjectures, Students covering their errours by privy escapes, and in the dust. At length, that hopes no less vain than pernicious, have been set to sale instead of true; but that blood-letting never helps, unless it be by accident, to wit, through want of art, and a more courteous or bountiful Medicine: but, that cuttings of a vein do alwayes take away long life. Also that Cauteries or searing Remedies have been brought in without ground, after that by the effect, they had already bewailed in vain, the uncertain and weak help of their Remedies. Next I will make manifest, that neither are *Tartareous* humours the causers or Patrons of infirmities. Likewise, that neither do Diseases arise from three beginnings, as neither out of the essentials, which *Chemia* or *Chymistry* boasteth of. I will also discover the vanities or fictions of a *Catarrhe*, or *Rhume*, that, that may not be a disease, which may be begotten by this parent: at length, I will lay the ground-work, that errours have been diligently taught concerning Winds. Lastly, I will vindicate the Heaven to be free, or harmless from seminal Diseases. The value of Medicines, and also the abuse of Physitians, on both sides, for Charities sake, I will explain. In the mean time, I will frame an Anatomy, or disecting of Diseases by their true Roots, and now and then I will unfold some, under an occasion of Discourse, by separating them from the common error: to wit, the *Apoplexie*, *Leprosie*, *Asthma*, the *Dropsie Ascites*, *Gont*, Disease of the *Stone*, filthinesses of the Wombe: at last, I have represented the Tragedies of Poysons, and of the Plague: that Medicines and healing Remedies may be appointed, not by contraries, nor by alike things, but onely by things that are endowed and appropriated: which way indeed, was the work, to destroy the whole natural Phylosophy of the Antients, and to make new the Doctrines of the Schools of natural Phylosophy. Last of all, I will treat of the Root of Life, whereof none hath treated. I beg of the Lord God, that he may vouchsafe to illustrate his free gifts sent into the place of Medicinal Exercise;

excise with more able wits, to make them fruitful with the large showre of his dew, and at length, speedily to perfect a cause of so great concernment, in this Age, that is full of misery.

An Index or Summary, of the first Colnmne or Section.

1. The intent of the Authour.
2. The rise of Medicine, and the continual succeeding corruption from thence.
3. The rise of Schooles and Sects.
4. The credulous sloath of the Europeans of greater success.
5. Medicine which entred through Galen, after it ran into a Circle, it was carried about like a Mill.
6. The penurious blindeneses of the Schooles.
7. A shame-fac'd composed Catalogue, of incurable Diseases.
8. Against bloud-letting from its indication, or that which sheweth it.
9. The Errours of solutive, or loosening Medicines.
10. The entrance of knaves into Medicine.
11. Some deceits of Galen.
12. With what ease Galen obtained the Chiefdom of healing.
13. That the sharpness of wit hath prevailed nothing, as neither the Schooles of the Heathens.
14. How much any one can profit in the Heathenish Schooles.
15. Why Medicine is the highest, and obscurest of Sciences.
16. The end of Medicine hath continued neglects.
17. The Errours of its ends are demonstrated.

COLUM. I.

Although self-love for the most part excludes the knowledge of truth, than which notwithstanding, nothing more pretious, is given to man: yet I have judged it a thing full of Christian pietie, to teach, how much Disciplines delivered unto me, have profited. Therefore I have consulted of a quite unwonted matter, to wit, to overthrow the cups of giddiness and sluggishness, wherewith, the Schooles being hitherto made drunk, have deceived the World, and blinded its eyes, for one and twenty Ages. First, *Hyperates*, a man of a most rare gift, and a partaker with the *Adeptists*, hath set forth some tedious things of his own experience, without any false paint, because there are a very few proper things of his extant: and those as yet, forced afterwards, to serve other mens pleasures, and Commentaries: although most of his works are corrupted dregs. Therefore this his industry, others have not boren; yea, such is the rottenness of dayes, that vertue and truth, have presently, from their first rise, emulous Companions: whence, any humane works are alwayes subject to ruine. For those things which in the more homely, but more sincere ages, were for Charity sake embraced, straightway, in gain, they found profits, riot and glory; therefore afterwards a boasting of pietie, succeeded Charity, and the vanity that arose from lucre, blotted out pietie. So indeed, the purity of healing changed into tongues, boastings, Controversies, brawlings and conjectures, and the faithful credit of former observations being left, they erected theoremes or speculations, gently applied to sloath and giddiness. Afterwards *Galen* (his *junior* by five hundred years) framed suppositions of Complexions, humours and degrees, promising in an easie Method, Mathematical demonstrations of those things, which nature onely is able to measure: which same things, he kept secret to himself, and at length, laid open some things to *Alchymists* alone. *Galen* the mean while, dispersed his Theoremes into a great Body, which afterwards, the prattle of the *Greeks* increased into a huge one, and which, the Schooles even to this very day, do superstitiously worship, because they have made themselves Trophies by others labours. Hence therefore, Study hath passed into Profession, and Universities; forasmuch as it hath not repented the *Latines* (whom the *Greeks* call *Barbarians*) *Galen's* followers, to propose this man as their Authour. For from the word healing, they have leaped over into Physitians, and erected Medicine, and so have erred in the entrance: also even to this very day, they have written their misfortune in their name: to wit, because they practised Medicine, and were Physitians, not from the work of healing; but from speaking onely, should they be called Physitians, and their Profession, Medicine: and their whole Medicinal Art, by their own confession, should be hereafter, onely talkative.

Neither

Neither have they pointed out by their divining Etymologic, that they can hope for reputation by their art, who have gotten a name onely from talking. The *Moors* afterwards promised the vittory, when as the Custom of the *Greeks* had almost lost the Flowre of Studies. But the *Europeans* despairing, as if the whole strength of their minde were feeble, have held it sufficient for them, to stay in barbarous inventions, and to have practised strange ones. But their fictions daily to have reduced into Centuries, they never accounted an ignoble thing, but have held it an honour, to be wise by a Commentary onely. Hence the Cup of sloath hath tainted the Schooles with drowlines, every one being more willing to assent, than to search carefully. Neither from *Hippocrates*, hath Medicine hitherto made any progresse thereby: but that which as yet returned through *Galen*, afterwards was carried about into a Circle: whence the Schooles conceived a giddiness, and *Galen's* delusions, imitating the *Cuckow's* note, alwayes wheeled about into the same Circle. For while Studies are set up for gain, Medicine is rowled about the Mill. For seeing that besides cutting of a vein, and the Shop of laxatives, the Schooles as yet to this day, do scarce acknowledge other Remedies, and all their endeavour is, that by blood, dung, bath, a Caustery, Sweat, and so not but by the diminishing of the body and its strength, and likewise by the corrupting of the blood (which they call a Purge) and by miserable butchery, they do presume to take away all griefs of the body. Hence it coms to passe, that (as he himself hath done) the admirers of those frail effects, have erected, a plentiful company of incurable Diseases; as it were driven with despair, they make none but a shamefac'd mention of those Diseases, and have brought in a dissembling kinde of Cure, full of Calamitie and despair. I say *Plethora*, or the abounding of humours alone, is called the shewer or betokener of blood-letting, which as it hurts for the future: so hunger, and the withdrawing of meat in the beginning of a sharp Disease do, together with a destructive Disease, easily empty out all abounding humours, in the first dayes. Neither that the vain device of revulsion and derivation, hath greatly profited, at sometime, by their own position, I have demonstrated in the Treatise of Feavers. But laxative Medicines, since they do at leastwise wipe away very new blood out of the Meseraic or sucking veins, and change it through the disposition of their poyson, by divers wayes corrupting it: truly, they have given hitherto none but a weak hope of healing by the event, full of confusion, sorrowes, and uncertainty. Therefore we are blinde, unless with a stout heart we (being at length moved with compassion) do go to meet so great a slaughter of mortal men, and the sighs of sick persons, or phanes, and of Widowes, and of the dead. For besides that, the helps of the Schooles for the sick, are so uncertain, and of so little credit, I intreat you, let us mutually commiserate mans condition, which hath committed his life and fortunes, to an art filled with conjectures and uncertainty: also that it hath admitted of all sorts of knaves and Harlots, whereby it may without punishment, exercise cruelty on our Kinsfolks.

When I exactly consider with my self, the so great sluggishness and blindeness of Schooles and Ages, I give praise to the thrice glorious God, that he hath made manifest to the little ones in himself, much truth, which he hath hidden from Noble Persons, and those in chief Seats: and therefore, I admiring the depth of the judgements of God, do religiously adore him.

But *Galen* snatching the glory of his Predecessors into himself, extended his own Art, contained in a few Rules, into huge Volumes. It pleased him indeed, that all Bodies should be framed of four Elements, and from thence to snatch their wholeness or Essence; and so that, to the square of these Elements, he confirmed, or framed four qualities, and as many simple Complexions, straight-way so many couples of Compound qualities; and from thence also foure constitutive humours of us: before, dreamed of by others. And then, from their strife and discord, joyned as well with a simple, as with his own feigned humours, he determined to derive almost all Diseases, and the scopes or indications of healing, even as health, from their fit proportion: also that every Disease is a meer disposition in quality: wherefore that of contraries, there are onely contrary Remedies. With which necessity, he being at length constrained, distinguishing the vertues of simples, word for word out of *Diascorides*, and the Elementary Degrees, he copied out their Seminal and specifical power, neglecting on both sides, because not knowing either.

By what facility of Art indeed, he allured the chieftom of healing to himself, he obtained it, and Posterity being allured with so great a compendium, a drowsie sleep crept

crept into the Schooles thorow the Doores of sloath; for the awakening whereof, I would, God might take his honour, and mortals the experienced fruit which I wish, by my labours.

- 13 Many I know well enough, will prate, grieving that themselves, and their tire some readings will be diminished, if I shall resign the sound truth of Medicinal Science unto the gift of the glorious God alone, but shall have very little hope in the sharpness of wits. But however they may grin, man is a plained and naked Table, and ought to get his Learning else-where, and from one onely Master: of whom it is said, that the Scholar shall never excel that Master, because there is onely one Father, and one onely Master, who dwelleth in the Heavens: from whom is every good thing, all light, and cleatness of understanding. Truly we Christians, do profess the Lord Jesus to be the onely wisdom of the Father, the beginning, and the ending of all Essence, Truth and Knowledge: and so, seeing every good gift, not onely of vertues, but also of knowledges, doth descend from the Father of Lights: who could learn perfectly the skill of the Science of Medicine, from the Schooles of the Heathens? for the Lord, not Schooles, hath created a Physitian.

- 14 The Heathenish Schooles indeed, may have an Historical knowledge, the observer of things contingent or accidental, of things regular, and necessary: which is a memorative knowledge of the thing done: they may also get Learning by demonstration, which is the knowledge of applying things unto measure. And lastly, they may promise rational knowledge, which is derived from either of these, by the fitting of discourse; and I wish they had soundly and sincerely performed what they might have done by those meanes! They may I say historically have known the reflux, or going back of the Starrs and Sea, that the water bends to a levelled roundness, and downward, draw divers Sequels from thence, and stablish them into maxims. They have known I say, the craft of composing, and how to fit the necessity of Causes (in some measure conjoynd) by discourse. But to understand and favour these things from the spring or first cause, is granted to none without the special favour of Christ the Lord.

- 15 Therefore the Science of healing is the last of all Sciences, and chiefly hidden, so that it is no wonder, that its first beginnings are even at this day desired from types or figures. The more diligent Heathens have as yet promised the World to continue by its own Law, and things to have their Roots in the whole, and in the particular kindes or Species, whereby by its own proper force, it was to be preserved for ever, and so an independency, or Deity to be in things. Alas! thereby, from the true Phylosophy and truth of Medicine, even as drunken men, about wan Deities and blindnesses, they have stumbled in the dark: and therefore they have of necessity, been ignorant of created things, and the Seeds, Roots, and knowledge of these. Therefore the knowledge of nature, hath indeed been attempted by the Heathens, through childish conjectures; and very little ever obtained. Therefore I have grieved with pity, that hitherto the beginnings of natural things have not been fetched forth elsewhere: the which, as I have determined to discover by this my labour: So I humbly intreat that God may grant, that he hath not yielded me his Talent for a recompence of punishment, although in this Work I could not do so much as I would.

- 16 For the whole faculty of natural Phylosophy is committed to man; and therefore this ought to respect both his life immediately, and all his defects. Therefore all natural Phylosophy is limited for the use of life; the finding out of causes, the Disease and Remedies: in which last point, I finde, that hitherto little pains hath been taken, no hing known, but much promised, and very much neglected, long expectations, and every where errors.

- 17 For the knowledge of Diseases containeth the knowledge of the Causes, the dependance and appropriating the same to our defensive faculties: in which hitherto there hath been an universal wandring. But the finding out of the Remedy, doth presuppose the aforesaid knowledges; and moreover, of the faculties and powers, I say, the manner and the meanes of acting: but the application of those Remedies, their preparation, and deriving or extracting, to be according to the safeguards, and scopes or intents of the parts. It also necessarily contains the knowledge of simples, their powers or vertues, their actions, changes, defects, alterations, interchangeable courses, and connexions or dependances, as well amongst each other, as in respect of the vitall powers. But every one of these do require the gift of God in a peculiar thing,

The Authour's Promises.

thing, to wit, understanding, and experience of selection or chusing out, of Sequestration or separation, of preparation, and graduation or subliming: of which I will shew, it hath not as yet been treated of by the Schooles.

The Summary of the second Column.

1. *An unwonted kinde of Doctrine is to be required.* 2. *That Art hath stood by Conjectures hitherto.* 3. *The Authour excuseth his roundnesse.* 4. *He had no light from Predecessors.* 5. *Why all things are new and unheard of.* 6. *The Prerogative of Physitians before other Artists and Professions.* 7. *The signes of a true Physitian.* 8. *The Prerogatives of Physicians out of the holy Scriptures.* 9. *The resigned liberty of the Authour.*

COLUM. H.

I Ought from the beginning, wholly to set upon Philosophy. A matter I say, never theoretically, or speculatively searched into, and lesse proved and known by exercise, that is, I have determined to lay open an unheard of truth. For unless we shall deal with Diseases, even like as other Arts do, with their objects: and unless we shall be able to promise, and foreknow an undoubted end of Diseases, by answering for the most part, the wished desire of the sick, after the manner of other Artificers, it is a sign that the meanes and end do stand committed to a conjectural and uncertain Art: where ignorance being the leader, and the way, a path of uncertainty, darkness doth at length lay hold of him, that goeth and leadeth thorow unknown paths.

I know many will be angry with me, especially those who ascribe my roughness and severity in reproving, to intolerable boasting. And then, as well those whom all things displease, that are not brought forth by their own will or judgement, do scoffe and abhor all new things: as those who thinking that they know all things, do refuse to learn. Notwithstanding, I could not, because of haters, bury my Talent in the Earth, and not make manifest my Zeal to my Neighbour. Therefore the free gifts and knowledge given me, I will discover to my Neighbour, without envy, deceit, hope of gain, or the vain glory of ambition, and will willingly shew as much as my experiences have made sufficient: hoping that the truth being once shewen, those that are endowed with a richer Talent, will be hereafter more profitable to the Common-wealth than my selfe: for so it becometh, that Disciplines by proceeding by additions, should be daily enriched: and therefore thus far shall those that come after, be obliged to those that have gone before.

Indeed it is believed, to be of great help, to have rowled over the Books of many that were before me, because it is easie to add ones own to the inventions of others. But in the business which I have taken on me, all kinde of help from Scholars hath been feeble, and therefore the Counsel and aid of my Auncestors, loose unto me. Because where I declare that the very quill of all Writers, hath been ignorant and diseased; it is very easie to discern, that no mans judgement hath at all profited me, but greatly hurt me. Therefore that the Writings of my Auncestors have fought with me, for some years, for the glory of truth, I do sincerely and candidly protest and profess.

But since I draw out all things new and unheard of, I will not interpret others inventions, as neither will I contend with their Authorities: and I have seemed to my self, to be a new Authour of Medicine, hitherto known onely by way of name. And therefore have I put the gifts to usury, for which, God the Creditor, hath ingraven me his poor Debtor, in his Book. All things are Paradoxes, or against the common opinion, I confesse: for if they should otherwise appear, I should think my self to be an unprofitable brawler, one prodigal of my dayes, and an unprofitable presumptuous repeater. Wherefore if it hath well pleased the Father of Lights, in the dayes of our Auncestors, to increase the number and tartness of Diseases: I likewise may believe, that I do not suppose it an unsuitable thing, that goodness hath opened its Treasures, that at length, she may quickly, safely, and gloriously anoint the marks

marks and wounds, which the Father of mercies hath inflicted: to wit, he who appointed a Physitian, or a Mediator between God and man from the beginning: yea, he made it his delight, that he would be overcome by a Physitian; indeed he testifieth, that he created and chose him to this end, for a peculiar Testimony of his praise. It is so in truth; for no sooner doth he punish, weaken, and threaten to kill man, but he desireth a Physitian opposing himself, that he may conquer himself, being omnipotent, also in sending deserved punishments: by the proper gifts of his Clemency. This is the Charity of the most high, upon all frail Creatures, to be esteemed, which he hath bestowed on Physitians chosen by himself, from Age to Age. He, he, is incomprehensible, sweetly disposing all things.

But of this sort are Physitians which are fitted from their Mothers womb (for this, the word: The most High hath created him, importeth) exercising his gift, with respect to no gain, and they are nakedly cast upon his good pleasure (yea the Command) of him, who alone being truly merciful, commands us, that under pain of infernal punishment, we be like to his Father.

Obey those that are set over you, is a Precept indeed: but, Honour thy Parents, honour the Physitian, is more strict than to obey, seeing we are constrained even to obey our youngers. For the Physician is a Mediator between the Prince of life and death. I desist, timely enough, considering the benefits undeservedly bestowed on me. Moreover, I neither require the Reader to be courteous, nor do I fear the scoffer. For it may be lawful to displease either, to whom it is lawful to dispraise all pains and knowledge.

For God hath so appointed, that new things do for the most part procure their hard censurers, and ungrateful ones. For I have renounced with great endeavour, to please Courts and Nobles; also to hang on the opinions of others, alwayes esteeming this to be a servile thing, even as on the contrary, it is plainly a free thing, not to submit with that Being, which is subject to none but God. For although it was hard in the beginning: yet it being accustomed to me, I have chosen that kinde of harshness, afterwards I made it full of pleasure through Custom; and I have found it sweet; and God grant, it may not increase in me, so much from arrogancy, as from the possession of more trim knowledge! For now and then, the while, I am mindeful of that word: *God hath scattered the bones of them who please men: they are confounded, because God hath despised them.* Therefore I certainly know, if the pleasure of the bestower will suffer, he will send his Dew upon the Corn, he will give increase, and so my Conceptions shall be profitable to the Common-wealth of Man-kinde, if the fulness of dayes be come; but if not, He at leastwise, knowes my inward parts, and I will expect the rewards of his Clemency. Let God therefore, be between me and the World, who is to judge both the one and the other. Let his Name be thrice gloriously sanctified, and let his sanctifying Will alone, be done in all. Amen.

The Summary of the third Columnne.

1. By what meanes, understanding may be given. 2. How the Authour hath found out falsehoods. 3. The Capitall Ignorance of Physitians. 4. The hardships of the Authour (being as yet a Junior) with other Physitians. 5. He hath forsaken all Books. 6. What, and how little, he learned by travelling. 7. He thought long agoe, Medicine to be an Imposture or juggling deceit of the Greeks. 8. How much he hath profited by Paracellus. 9. The Authours Ingenuity. 10. From whence the Schooles are to beg their Excuse.

COLUM. III.

1 **C**harity intreats, desire seeketh, and necessities do knock in the Soul, out of Compassion. Thus is understanding given. Truly it shamed me, even from a young man, that a Work-man, being called to a work, should promise that
2 work, and stand to his promises: but that I being called to a sick man in the beginning
of

The Authour's Promises.

of the Disease, and his strength as yet remaining, should suffer the same man to die. For I being full of fear, believed, that it was not enough to say, *It is not I the Physician, that the sick party alwayes be eased*: and by a liberty springing from thence, rashly to proceed, and continue in the work of a Physician, by saying, I shall be excused, because I have done what I could, according to the Maxims of Art: if I know my self every way defective, and that the suppositions of Art themselves are rotten in their Root.

For indeed the ignorance of Physicians proceeding ill in healing, is almost capital: because it is not to be blotted out with God, where, a man will give skin for skin. For it is a signe that such a Physician entred not in by the doores, but by the Windows, and attributed a false name to himself: I indeed, even from my tender bones or years, have esteemed knowledge before riches.

Indeed Physicians demanded, why I lesse cured according to *Galen*, and refused to follow them, or the flock of those that went before them? they also promised, that I should gain more Duckats yearly, than many of their own together: but after that, their speculations were of suspected credit with me, I being careful, sought for a more safe path. For I more breathed to know, than to be enriched. And I wish it be purely in me for God! At least, sufficient riches came together with any kinde of knowledge. Straightway I learned, the more to doubt of the steadfastness of *Galen's* Speculations, after I had beheld the very Maxims of the Schooles themselves, to be full of fores and defects; then at length, by little and little, I more and more confirmed this conceit by Discourse and Experience; to wit, that every way, the Seeds of ignorance, by the same contagion, pierced even into the Root of healing, and mindes of the healers.

Therefore I straightway left off all Books of all, accurate Discourses, and empty promises of the Schooles, firmly believing every good gift to come down from the Father of Lights; and rather also, that of Medicine Adeptical.

I have thorowly viewed some forreign Nations, and I found almost the same sluggishness and ignorance amongst them all. But those who were the more diligent searchers after knowledge, indeed I found also more steadfast in their purpose, and more circumspect in presuming: but alike, yea more ignorant than the rest. In the mean time, it ingeniously grieved me, of the pains I before took, and of the disquietness I endured in learning. But in multitude of Books there was no where comfort or knowledge; but vain promises, abuses, and very many errors.

Therefore I long since considered with my self, that the Art of healing was a meer juggle, brought in by the *Greeks*: till at length, the holy Scriptures better instructed me; I considered, that the Plague was a most miserable Disease; in which, every one forsook the sick, and unfaithful helpers, distrusting their own Art, more swiftly fled, than the unlearned common people; and the homely curers of the Plague: therefore I proposed to my self, to dedicate one Salutation to the miserable infected. Although then no Medicine was made known to me, but trivial ones; yet God preserved my innocency from so cruel an enemy. For though I was not sent for, I went of my own accord to see them; not so much to help them, as being desirous to learn: yet all that saw me, seemed to be refreshed with hope and joy; and I my self, being fraught with hope, perswaded my self, that by the meer free gift of God, I should at sometime obtain the Science of the Adeptist. But after ten years Travel, and Studies, from my Degree in the Art of Medicine, taken at *Lovaine*: at length, in the year 1609, being now married, I withdrew my self from the common people, to *Vitruard*, that, being the lesse troubled, I might proceed diligently to view the Kingdoms of Vegetables, Animalls, and Minerals; by a curious Analysis, or unfolding, by opening Bodies, and by separating all things, I went about to search for full seven years: I searched into the Books of *Paracelsus*, filled in all parts with a mocking obscurity or difficulty, and I admired that man, and too much honoured him: till at length, understanding was given, of his Works, and Errors.

For not a Friend, the thief of dayes, never riotous feasting, or drinking Bouts, detained me, who then as yet, could not bear Wine; but continual labour, through extraordinary watching nights, did accompany my desires. And at length, being perfectly taught, that the corporeal faculties or powers, were bound up in their principles or beginnings; and those not worthily to be known, without an unlocking of their bolts, I sung a Hymne to my God, that it repented me not of time, pains, costs, and gain neglected, being recompenced with the sweetness of knowledge Adepticall

depticall. In the mean time, Reader, I am angry with myself, because it is scarce lawful to open my conceptions, in the truth, without hurting the esteem of Authours gone before me. But the liberty of former Ages hath raised me up, which made *Galen* to go unpunished, yea to be praised, although he frequently made *Erasistratus*, *Asclepiades*, *Protagoras*, *Eristratus*, *Herophilus*, (I here make no mention of *Moses*) and many that were before him, guilty of error: yea, and he hath often carped at *Quintus* his Master, whom notwithstanding (though an Emperick) he witnesseth, that he hath followed in most things.

But what shall be for a damage to them that have trodden in the beaten way, but were ignorant of the safe path of healing? For who hath understanding, which he hath not freely received? I confess indeed, that the errors of the Schooles have not come through the fault of imprudency: if gifts do alwayes depend on the free will of the giver, and those do not spring up before the due and ripe fulness of dayes. But to have been unwilling to acknowledge errors once laid before them: this then at leastwise, becomes guilt. Certainly *Hippocrates* had knowledge to cure the devouring Plague, and with him, that knowledge slept, the most High so willing it. Are those that come after, therefore to be blamed? for it is not of him that willeth, nor runneth, but alone of God that sheweth mercy: like as it is a fault of the despiser, not to have rested quietly in the truth set before him, and to have lifted up his hand unto him.

CHAP. I.

The Authours Confession.

1. The muttering or murmuring of the Authour.
2. The Physicians in Ireland, are preferred before the Italians.
3. The Romanes without Physicians, lived the better.
4. A Dream sheweth to the Authour, his Soul.
5. The manner of the minde in understanding.
6. What is the Vicarship of the minde.
7. What is the appearance of the Soul.
8. The minde hath required from the Authour, a disposed or fit intention in writing of this Book.
9. The privy escape of selfishness in the Authour.
10. The answer of the minde.
11. A Confession of vanity that is apt to happen.
12. That which the Authour saw after Repentance.
13. Another Vision intellectual.
14. The Authours Repentance.

WHEN I had thorowly read over this my Labour, and had (as it were in one point) comprehended in my abstracted Intellect or Understanding, the Content of this Book, I said with a sigh: *Oh the cares of men! Oh what emptiness there is in things!* which way is it meet, to pursue the Errors of the Schooles? or what profit shall the Christian World perceive? whether we have known Diseases to proceed from conceived Beings; or at length from heats, or to overflow with feigned humours? for O wretched man, hast thou not laboured in vain? For to what end is so great brightness of speculation? have not all these things the fewel of presumption? For I remember that a Nobleman of Ireland, gave Land to his Household Physician: not indeed, who had returned instructed from Universities: but he healed the sick. For he hath a Book, left him by his Auncestors, filled with Remedies. And so the Heire of the Book, is alwayes Heire of that Land: that Book deciphereth the Signes of Diseases, and the proper Remedies of that Countrey. And the sick Irish are more happily cured, and are far more strong than the Italians, who have their paultry Physicians in all Villages, living by the blood of miserable men. Therefore I said to myself, *what vain error hath inticed thee?* that thou lastly, hast meditated of a thing that will be of great moment, if the Universities shall scoffe at thy debates, and tread them under foot? And although thou hast not written, so much as for thy small glories sake, yet all things are vain in the hands of men. Thou hast thought indeed, if thou shouldest do otherwise, that thou hadst buried thy Talent granted unto thee.

Truly

Truly, lived not the *Romans* for five hundred years, without Physicians, and in a far more happy health, than afterwards, when they had vanquished the *Greeks*; from whence they privily received Physicians. Would it not be a happy Age, if the pricks of Speculation, together with the Thistles and Thorns of the Earth, were burnt, and the Tares being left behinde, that we should feed upon Wheat alone? Certainly, I know not, whether through the tiresomeness of reading, or indeed, by sleep creeping on me, these injuries of the truth, unworthy an answer, did terrifie my minde.

At leastwise, a great repose straightway invaded me, and I fell into an intellectual Dream, and memorable enough. For I saw my Soul small enough, in a humane shape, yet free from the distinction of Sex. Straightway I doubted, having wondered at the sight, not knowing what selfishness there was in me, which should see my Soul distinct from it self, and should understand my understanding out of it self? and then a certain light entred into my Soul: in comparison whereof, the visible light of this World, seemed to contain dreggish darknes. For neither was that light separte from the Soul it self, and therefore it had not any thing like it self, in sublunary things.

Then presently, I perceived, that we which are now together with the flesh, are withdrawn by the same, from the true and clear understanding; and that the Soul understands in peace and rest, not in doubting, and by the leading of enforced reason, for the most part bringing into it self, blinde likenesses of that which is true, intricate fallacies, and unlucky persuasions of the truth: neither rejoycing in running out to things like, should it level Similitudes, and the proportions of these, purging them from the lees, by relations or things referring: neither should it let it self downward, to faculties beneath, stooping down into an Analysis or Solution, and a Synthesis or composing: neither should it weigh all things, as being driven about with divers blasts of uncertainties, passions, and confusions of infirmities.

But I have taken notice, that the former majesty, or greatness of the minde, being fallen, another birth did arise: wherein the sensitive Soul, did exercise the Vicarship of the minde: the which, seeing it wanted (through a confused knowledge) the stirring up of conclusions and Disciplines, it now supplies the place of true understanding, and proudly attributes to it self, all selfishness. For hence have I learned, that it happens, that we do not perceive that we do understand any thing, so long as the chief Agent of this wretched and frail understanding, hath not turned its force even to the bounds of sense. Wherefore also, neither do we remember that we do understand, unless the same action be propagated or planted into us by a sensitive order or Government. For neither therefore do we mark that we do know, but when there is made a certain mutual passing over of faculties, and as it were the Corners of actions (through divers Agents playing their parts) are wrapt together about the middle. Therefore in this duplicity of understanding appointed unto me, the threatening of the Lord, who is to judge our righteousnesses, is turned against my Soul. Because I had purposed to search into all things, which are under the Sun; and because the thrice glorious God hath given to every one of the Sons of men, their peculiar occupation, that they may exercise themselves.

Eccles.
I. II.

Therefore the Soul determined to examine it self in the Image set before it. According to that saying, *For who knowes the things that are of man, but the Spirit of a man that is in him?* afterwards then, the Soul opened the Eye-brow of the right Eye. For it was not indeed, in the likeness of a mans Eye, distinguished by Coats, the Apple, and diversity of humours: but the Eye was one onely, round, clear, even as the Star of *Venus* seemeth to be afar off: which Eye, although it was most exceeding beautiful in brightness: yet through its unaccustomedness, it struck me to the heart. But it shone as well inwardly, towards the bottom of the Soul, as without, thorow the whole Soul; and it sent forth a beam into the splendor of that understanding, afore hidden, which had framed a selfishness, severed from it self.

But it desired an account from the animosity or sturdiness of the sensitive Soul: to wit, whether in the composing of this Book, it had alwayes with a resigned will, nakedly offered up all things into the most pleasing goodness, and well liking of God? or indeed, it at any time had presumed of it self, like those that are busied all their life time, in thinking of the Title of a Sepulchre? Or what posterity should think of it? But the selfishness, as it were the light of a discussing Intellect, refusing to suffer, endeavoured to sink it self within the body, by privily shifting of the diligent examination of contemplative truth. But in the same kinde of visions, wherein the understanding apprehendeth the selfishness; this standeth

as besides the Body: Where, ore it not being able to hide it self from the ray of the Soul, which did shine thorow it, after a wholly unaccustomed manner, it sought a crafty evasion: as though, for the bashfulness of the thing, and newness of the place, it required a truce till the next day after the morrow, hoping that perhaps, by one dayes delay, the understanding might be unimpaired of its Enterprize.

10 But the Soul said; *Every day hath its burden, and desires its own account*: there is no need of delay to the confession of truth: also the morrow will give no aid. Thus

11 therefore, withdrawing and delay are taken away. Then therefore the selfishness confessed; I confess, and willingly abhorre, that the general frailty of men, disposed to Custom, hath forthwith defiled me: I believing, that honour did deservedly, and worthily nourish all Arts, according to the saying of the Heathens: which being said, the selfishness it felt perceived its deformity. And thereupon, even the intellect being the more smitten with grief, as it were sighed, knowing my want, yea, and too much miserable want of understanding in the body, the which, as yet notwithstanding, with the applause of men, and having enjoyed a little unconstant glory, it would carry out. For by a special privilege, all honour and glory belongs to God. I knew therefore, that I had denounced War against God, and had brought in an estrangedness on the whole Universe, by a vain endeavour. Because the universal order of things, is, that all things be primarily, in their ultimate end, and totally, for the honour of God. Therefore, that my labour might not be wholly reprobate (as yet far off from goodness) it was altogether needful, seriously to purge by Sacrifice, this my blot. Wherefore hither did repentance look, and was expected from above, with an importunate suite.

12 Which coming to me, another Eye at length opened it self. For then I saw, that the searching into all things which are under the Sun, was a good gift, descending from the Father of Lights, into the Sons of men, for a diligent Study, and a certain serious amending of forepast ignorance, otherwise the danger of a vain complacency, or well-liking, would sometimes vex by the By. Wherefore I humbly begged of the Lord, for the good pleasure of his own piety, with the every way displeasure of my own vanity, that he would spare me, and vouchsafe to mortifie the selfishness, alwayes reflex or returned upon me.

13 In the mean time, I decreed with a resolute minde, to bury this Book in the fire: which very thing I had also performed, and was now ready to execute, had not another intellectual Vision offered it self unto me: for I saw before me, a most exceeding beautiful Tree, spread forth as it were thorow the whole Horizon; whose greatness and largeness, notably amazed me. It was bespangled with flowers innumerable, odoriferous, and of a most pleasing and lightsome Colour: every one whereof, had a bud behinde them, a pledge of Fruit. Therefore I cropt of one of so many ten thousands, for my self, and behold, the smell, colour, and whole grace of the Flowre, straightway perished. At the same instant, an understanding of the Vision was given to me. To wit, all the gifts of God to be like Flowers, and more glorious than *Salomon* in his Throne: indeed of great expectations, if they shall remain in the Tree. But if man doth appropriate the gift to himself, or dareth to crop it off from its original, although the Flowre doth vanish from him: yet the cropper remaineth the debtor of the promised Fruit.

14 Therefore I decreed hereafter, to leave the gift of God in its own Tree, nor to arrogate any thing to my self by cropping it off; and I willingly confess my aforepast ungratefulness towards the Tree. Because whatsoever I have of his, hath been freely bestowed, and granted me for a time, conditionally: But from the bottom of my Soul, do I detest my vain and foolish ignorance, because I thought, that gift, falling with a strange beam into me, in the first place, to reflect upon my self. For as from mud or dung, there ascends a stinking sent or smoak: so from Learning, a pride of Learning. Indeed I delighted, rather in the Being of Reason, than in the sound truth: thinking it would happen, after an honourable death, that none shall make himself great by desert. Indeed that honour would be an applause, of many, through the judgement of those that erre. Therefore I abhorre, I refuse from this day, and renounce the prayes, whatsoever they be, that any one, at any time, shall give me. Now at length I perceive, what spots, the love of a little vain glory may have, I have denounced open Warre against the same, knowing, yea feeling by the afore-past Vision, that although it be easie not to take praise, while it is not given: yet how hard it is, not to delight in the same, while it is offered. Because I have

The Authour's Confession.

Have experienced how horrid a thing it may be in the Age to come, to have attributed part of the whole glory due to God, to ones self, upon any trifling account. Therefore I did desire, that this Book might issue out for the common good, the name being suppressed, that I might testify that I do hereafter despite the common Air or Applause. But the Decree of the Powers hindereth. *Every Soul is subject to the Powers.* Let God the Fountain of all good light, help me, that I may proceed to scorn myself in good earnest, while as sometimes behind, and anon on the side, vain presumption hath in times past crept in, that hereafter it may not any way trouble me. He will send his dew upon the Corn, if happily it shall please him to increase, what I have sown for the use of my Neighbour. In the mean time, I wish, Oh ye faithful in Christ, that I be judged an unworthy, evil, ignorant, and rash man, so my Neighbour shall not feel damage in healing, thereby. For he shall not esteem me unprofitable and ignorant in vain: yea, if these things shall not become guilt unto me, I attribute it to his bottomless clemency, which turns all things into good to those that love him, for his great goodness sake: unto whom I humbly offer, return, and lay down, my vain prayes, from the weakness of my confession and submission.

CHAP. II.

The Authours Studies.

1. *The Birth and Life of the Authour.* 2. *The Authour hath laughed at the masked Industries of Professors.* 3. *The nakedness of the Authour.* 4. *He hath prosecuted more solid Sciences at leasure.* 5. *He did vilifie Astrology.* 6. *He despised a Canonship.* 7. *What furtherance there is of Studies among the Jesuites at Lovaine.* 8. *Stoicisme displeased him.* 9. *Stoicisme is to be despised from a Command.* 10. *The Authour is snatcht into Medicine, as it were by chance.* 11. *The defect of Herbarists.* 12. *Medicine onely flowes down from above, and therefore it cannot be delivered by Rules.* 13. *Those that are instructed in an infused knowledge, are not to be taught by Authours.* 14. *The juggle of a certain Professor of Medicine.* 15. *Why he left off the Study of the Law.* 16. *How great the Authours barrenness and nakedness was, by studies.* 17. *What he hath done for the beginning of Studies.* 18. *Practise hath discovered the nakedness of Physitians.* 19. *A Prayer for the Errours of the Schooles.* 20. *Raphael is promised in a Dream.*

IN the year 1580, the most miserable one to all Belgium, or the Low Countries, my Father died. I being the youngest, and of least esteem of my Brethren and Sisters. For I was brought up in Studies. But in the year 1594. I had finished the course of Philosophy, which year was to me the seventeenth. Therefore since I had onely a Mother, I seemed at Lovaine to be made the sole disposer of my Right and Will. Wherefore I saw none admitted to Examinations, but in a Gown, and masked with a Hood, as though the Garment did promise Learning; I began to know, that Professors for sometime past, did expose young men that were to take their degrees in Arts, to a mock: I did admire at the certain kinde of dotage in Professors, and so in the whole World, as also the simplicity of the rash belief of young men. I drew my self into an account or reasoning, that at leastwise I might know by my own judgement, how much I was a Philosopher, I examined whether I had gotten truth, or knowledge.

I found for certainty, that I was blown up with the Letter, and (as it were the forbidden Apple being eaten) to be plainly naked, save, that I had learned artificially to wrangle. Then first I came to know within my self, that I knew nothing, and that I knew that which was of no worth. For the Sphere in natural Philosophy, did seem to promise something of knowledge, to which therefore I had joyned the

Astrolobe, the use of the Ring or Circle, and the speculations of the Planets. Also I was diligent in the Art of *Logick*, and the Science Mathematical, for delights sake, as often as the reading of other things had brought a wearisomness on me.

- 4 Whereto I joyned the Elements, or first Principles of *Euclid*; and this Learning, I had made sociable to my Genius or natural wit, because it contained truth; but by chance, the art of knowing the Circle of *Cornelius Gemma*, as of another Metaphysick, came to my hand. Which, seeing it onely commended *Nicholas Copernicus*, I left not off, till I had made the same familiar unto me. Whence I learned the vain eccentricities, or things not having one and the same Center, another circular motion of the Heavens: and so I presumed, that whatsoever I had gotten concerning the Heavens, with great pains, was not worthy of the time bestowed about it.

- 5 Therefore the Study of Astronomy, was of little, or no account with me, because it promised little of certainty or truth, but very many vain things. Therefore having finished my Course, when as I knew nothing that was found, nothing that was true, I refused the Title of Master of Arts; being unwilling that Professors should play the fool with me, that they should declare me Master of the seven Arts, who was not yet a Scholar. Therefore I seeking truth, and knowledge, but not their appearance, withdrew my self from the Schooles.

- 6 A wealthy Canonship was promised me, so that I would make my self free to Theology or Divinity; But *S. Bernard* affrighted me from it, because I should eat the sins of the people. But I begged of the Lord Jesus, that he would vouchsafe to call me thither, where I might most please him. For it was the year, wherein the Jesuites had begun to teach Philosophy at *Lovaine*, the King, Nobles, and University, being against it; and that thing, together with them, was forbidden by *Clement* the Eighth. But their Scholars aspiring to their Degree, they had assembled them to the School-houses; but others, and the more rich, they did allure with the pleasant Study of Geography; and one of the Professors, *Martine del Rio*, who first being the judge of *Turma* in *Spain*, and afterwards wearied in the Senate of *Brabant*, being allured to the Society, and had resorted thither also, did expound the disquisitions, or diligent examinations of Magick. Both the Readings I greedily received. And at length, instead of a Harvest, I gathered onely empty stubbles, and most poor patcheries, void of judgement.

- 7 In the mean time, least an houre should vanish away without fruit, I rub'd over *L. Annaeus Seneca*, who greatly pleased me, and especially *Epictetus*. Therefore I seemed, in moral Philosophy, to have found the juyce of truth: and then presently I thought, this was that for which *Pythagoras* might require the strict Silences of so many years, an excellent judgement, and therefore notable obedience. At length, a few years being changed, I saw a *Capuchin* to be a Christian Stoick. Indeed Study for Eternity, smiled on me; but for so great austereness, my more tender health was a hinderance. I prayed the Prince of life divers times, that he would give strength, whereby I might contemplate of the naked truth, and immediately love it. *Thomas of Kempis*, increased this desire in me, and afterwards *Taulerus*. And when I presumed, and certainly believed, that through Stoicisme, I did profit in Christian perfection, at length, after some stay and weariness in that exercise, I fell into a Dream.

- 8 I seemed to be made an empty Bubble, whose Diameter reached from the Earth even to Heaven: for above hovered a flesh-eater; but below, in the place of the Earth, was a bottomless pit of darkness. I was hugely agast, and also I fell out of all knowledge of things, and my self. But returning to my self, I understood by one conception, that in Christ Jesus, we live, move, and have our being. That no man can call even on the name of Jesus to Salvation, without the special grace of God. That we must continually pray, *And lead us not into temptation, &c.* Indeed, understanding was given unto me, that without special grace, to any actions, nothing but sin attends us. Which being seen, and favourily known, I admired my former ignorances; and I knew, that Stoicisme did retain me an empty and swollen Bubble, between the bottomless pit of Hell, and the necessity of imminent death. I knew I say, that by this Study, under the shew of moderation, I was made most haughty: as if trusting in the freedom of my will, I did renounce divine grace, and as though, what we would, we might effect by our selves. Let God forbid such wickedness, I said. Wherefore I judged, that Blasphemy to be indulged by Paganisme indeed; but not to become a Christian: and so I judged Stoical Philosophy,

play, with this Title, hateful. In the mean time, when I was tired, and wearied with too much reading of other things, for recreation sake, I rouled over *Marbrianus* and *Diascorides*, thinking with my self, nothing to be equally necessary for mortal men, as by admiring the grace of God in Vegetables, to minister to their proper necessities, and to crop the fruit of the same.

Straightway after, I certainly found, the art of Herbarisme to have nothing increased since the dayes of *Diascorides*; but at this day, the Images of Herbs being delivered, with the names and shapes of Plants, to be on both sides only disputed: but nothing of their properties, virtues and uses, to have been added to the former invention and Histories: except that those who came after, have mutually feigned degrees of Elementary qualities, to which the temperature of the Herbe is to be attributed. But when I had certainly found, happily two hundred Herbes, of one quality and degree, to have divers properties, and some of divers qualities and degrees, to have a Symphony or Harmony (suppose it in vulnerary or wound potions) in producing of the same effect: not indeed the Herbs (the various Pledges of divine Love) but the Herbarists themselves began to be of little esteem with me: and when I wondred at the cause of the unstableness of the effects, and of so great darkness in applying and healing: I inquired whether there were any Book, that delivered the Maxims and Rules of Medicine? For I supposed, Medicine might be taught, and delivered by Discipline, like other Arts and Sciences, and so to be by tradition: but not that it was a meer gift.

At leastwise, seeing Medicine is a Science, a good gift coming down from the Father of Lights, I did think, that it might have its Theoremes and chief Authours, instructed by an infused knowledge, into whom, as into *Bazael*, and *Aholiab*, the spirit of the Lord had inspired the Causes and knowledge of all Diseases, and also the knowledge of the properties of things. Therefore I thought these enlightened men to be the Standard-defending Professors of healing. I inquired I say, whether there were not another, who had described the Endowments, Properties, Applications, and proportions of Vegetables, from the *Hyssop*, even to the Cedar of *Libanus*?

A certain Professor of Medicine answered me, none of these things might be looked for in *Galen* or *Avicen*. But since I was not apt to believe, neither did I finde, among Writers, the certaintie sought for, I suspected it according to truth, that the giver of Medicine would remain the continual dispenser of the same. Therefore I being carefull and doubtful, to what Profession I should resign my self, I had regard to the manners of the People, and Lawes, and pleasures of Princes; I saw the Law to be mens Traditions, and therefore uncertain, unstable, and void of truth: For because in humane things there is no stability, and no marrow of knowledge, I seemed to passe over an unprofitable life, if I should convert it to the pleasures of men.

Lastly, I knew, that the government of my self, was hard enough for me; but the judgement concerning good men, and the life of others, to be dark, and subject to a thousand vexatious difficulties: wherefore I wholly denied, the Study of the Law, and government of others. On the other hand, the misery of humane life was urgent, and the will of God, whereby every one may defend himself so long as he can; but I more inclined with a singular greediness, unto the most pleasing knowledge of natural things; and even as the Soul became Servant to its own inclinations, I unsensibly slid, altogether into the knowledge of natural things. Therefore I read the Institutions of *Fuchius*, and *Fernelius*, whereby I knew that I had lookt into the whole Science of Medicine, as it were by an Epitome, and I smiled to my self. Is the knowledge of healing thus delivered, without a Theoreme and Teacher, who hath drawn the gift of healing from the Adeptist? Is the whole History of natural properties, thus shut up in Elementary qualities? Therefore I read the works of *Galen* twice, once *Hipocrates* (whose Aphorismes I almost learned by heart) and all *Avicen*, and as well the *Greeks*, *Arabians*, as *Moderns*, happily six hundred, I seriously, and attentively read thorow; and taking notice by common places, of whatsoever might seem singular to me in them, and worthy of the Quill. At length, reading again my collected stufte, I knew my want, and it grieved me of my pains bestowed, and years: When as indeed I observed, that all Books, with institutions, singing the same Song, did promise nothing of soundness, nothing that might promise the knowledge of truth, or the truth of knowledge.

In the mean time, even from the beginning, I had gotten from a Merchant, all simples, that I might keep a little of my own in my possession, and then from a

Clark of the Shops, or a Collector of simples, I had all the usual Plants of our Countrey; and so I learned the knowledge of many by the looks of the same. And also I thorowly weighed with my self, that indeed I knew the face of Simples, and their names: but, than their properties, nothing lesse.

- 17 Therefore I would accompany a practising Physitian, straightway it repented me again, and again, of the insufficiency, uncertainty, and conjectures of healing. I had known indeed, problematically, or by way of hard question, to dispute of any Disease, but I knew not how to cure the very pain of the Teeth, or scabbedness, radically. Lastly, I saw that Fevers and common Diseases were neither certainly, nor knowingly, nor safely cured; but the more grievous ones, and those which cease not of their own accord, for the most part were placed into the Catalogue of incurable Diseases. Then it came into my minde, that the art of Medicine, was found full of deceit, without which, the *Romans* lived happily, five hundred years. I reckoned the *Greeks* art of healing to be false: but the Remedies themselves, as being some experiments, no lesse to help without a Method: than that the same Remedies, with a Method, did deceive most. On both sides, I discerning the deceit and uncertainty of the Rules of Medicine in the diversities of the founders of Complexions, I said with a sorrowful heart. Good God! how long wilt thou be angry with mortal men? who hitherto hast not disclosed one truth, in healing, to thy Schooles? how long wilt thou deny truth, to a people confessing thee? needful in these dayes, more than in times past? Is the Sacrifice of *Moloch* pleasing to thee? wilt thou have the lives of the poor, Widows, and Fatherless Children, consecrated to thy self, under the most miserable torture, of incurable Diseases, and despair? How is it therefore, that thou ceasest not to destroy so many Families, through the uncertainty and ignorance of Physitians? I fell withall on my face, and said, Oh Lord, pardon me, if favour towards my Neighbour, hath snatched me away beyond my bounds. Pardon, pardon, Oh Lord, my indiscreet Charity; for thou art the radical good of goodness itself. Then hast known my sighes, and that I confess, that I am, know, am worth, am able to do, and have nothing, that I am poor, naked, empty, vain: give O Lord, give knowledge to thy Creature, that he may very affectionately know thy Creature, himself first, other things besides himself, for thy Command of Charity, all things, and more than all things, to be ultimately in thee.

- 19 Which thing, when I had earnestly prayed from much tiresomness, and wearisomness of minde, by chance I was led into a Dream, and I saw the whole Universe, in the sight or view of truth, as it were some Chaos, or confused thing, without form, which was almost meer nothing. And thence I drew the conceiving of one word; which did signifie to me, what follows. Behold thou, and what things thou seest, are nothing: whatsoever thou dost urge, is lesse than nothing it self, in the sight of the most high. He knowes all the ends or bounds of things to be done; thou at leastwise mayst apply thy self to thy own safety. Yea in that Conception, was there an inward Precept, that I should be made a Physitian, and that at sometime, *Raphael* himself should be given unto me. Forthwith therefore, and for thirty whole years after, and their nights following in order, I laboured, to my cost, and dammage of my life, that I might obtain the Natures of Vegetables and Mineralls, and the knowings of their properties. The mean while, I lived not without prayer, reading, narrow search of things, sifting of my Errours, and daily experiences written down together. At length, I knew with *Salomon*, I had for the most part hitherto perplexed my Spirit in vain, and vain to be the knowledge of all things, which are under the Sun; vain are the searchings out of Curiosities. And whom the Lord Jesus shall call unto Wisdom, He, and no other shall come; yea, he that hath come to the top, shall as yet be able to do very little, unless the bountiful favour of the Lord shall shine upon him. Thus have I waxed ripe of age, being become a man, and now also an old man, unprofitable, and unacceptable to God, to whom be all Honour.

CHAP. III.

The hunting, or searching out of Sciences.

1. The minde is not rational, if it be the Image of God. 2. The opinion of the Schooles concerning Reason. 3. A Vision in a Dream concerning Reason. 4. A Dialogue or Discourse of the minde with Reason. 5. The chief juggle of Reason. 6. The minde hath chosen understanding. 7. Reason becomes suspected by reason of her juggling deceits. 8. The weariness of the minde concerning Reason. 9. Reason began from sin. 10. What kinde of knowledge there is of the Soul, being seperated from the Body. 11. The minde hath withdrawn her Garments from Reason, in her flight. 12. Reason enters into the counsel of the minde, from an abuse. 13. Reason burdens the minde. 14. Reason being reflexed towards it self, doth produce many Errours. 15. The great Art of *Lullius* is sifted. 16. The manner of seperating Reason from it self. 17. An unutterable intellectual Light. 18. A feeling of the immortality of the Soul. 19. Reason is not the Lamp of which *Solomon* speaks. 20. In what part a Syllogisme dwells. 21. Reason generateth a dim knowledge. 22. Knowledges of the Premises are from the light of the Candle, or Lamp. 23. The minde is not deceived, but by its own reason. 24. Reason burieth the understanding. 25. Reason is known in its poorest nakedness. 26. The understanding refuseth the use of reason. 27. Reason and Truth, are unlike in their Roots. 28. Reason doth not agree with the knowledge of the conclusion. 29. A definition of Reason. 30. The most refined Reason, is as yet deceitful. 31. What Reasoning and Discourse are. 32. What intellectual Truth is. 33. Imagination is a crooked manner of understanding. 34. Bruit Beasts are discursive. 35. A rational Creature for man, is disgraceful. 36. A true definition for a man. 37. The Schooles hearken more to *Aristotle* than to *Paul*. 38. An Animall, or living Creature, in the definition of a man, belongs to corrupted nature. 39. What kinde of Skeleton or dry Carcase, that of reason is. 40. A progress to chase after Sciences. 41. Double Images, or likenesses in the Soul. 42. Where the Progress of the minde is stayed. 43. How a truer Progress may be made. 44. New understanding, or the labour of wisdom. 45. The understanding doth strike in, or co-agree with things understood, and how that may be done. 46. Why there is made a transmigration or passing over of the understanding. 47. The memory and will are supped up. 48. The thinglikeness or Essence of an intellectual thought. 49. How the Image of God lightens or shines all over. 50. How the minde beholds the understanding under an assumed form. 51. The Errour of the *Rabbins* concerning this State of the Soul. 52. The quality of the understanding, while it stands in that light. 53. Why, and after what manner the understanding transformeth it self. 54. After what manner the understanding beholds it self. 55. What intelligibility or understandingness may be. 56. How the Soul understanding it self, shall understand any other things. 57. Whence that difficulty of understanding is. 58. Why accidents cannot be comprehended by the intellect. 59. The Errours of the Schooles about the dividing of the intellect. 60. In things pertaining to understanding, it is more noble to suffer than to do. 61. *Aristotle* knew not a true understanding. 62. The Phantasie or Imagination doth not pierce things, neither in like manner, do things enter into it. 63. Eight Maxims touching the understanding, which *Aristotle* knew not. 64. A dividing of the Predicament of a Substance.

The hunting or searching out of Sciences, begins from

[Know thy Self.]

Reason is accounted to be the life of the Soul, or the life of our life. But I believe, that the Almighty is alone, the way, the truth, the life, the light, of living Creatures, and of all things; but this is not reason. And therefore, that our minde ought to

to be intellectual; but not rational, if it ought to shew forth the most immediate Image of God. That Paradox is to be cleared up, for the searching out of all things knowable, and especially of things Adeptical, or the attainment of great secrets. By my will, or according to my assertion, all Philosophy begins and proceeds from the knowledge of ones self: whether it be natural, or morall.

2 I will therefore propose, so far as I (through my slenderness) do attain, the understanding, and the abstruse or hid, or inward knowing of our selves. For the undoubted opinion of the Schooles, beares in hand, that God hath bestowed on man, nothing more precious than Reason, by which alone, we are distinguished from brut Beasts, but bear a co-resemblance with the Angels. So I being also perswaded from my tender years, believed. But after that, discretion had waxed ripe, and I had once beheld my Soul, I perceived altogether otherwise: I confess in the mean time, that I had rather be wise in secret, than to be willing to seem wise; but to be alwayes more desirous to learn, than to be one that endeavoureth to teach. Notwithstanding, I ought to teach some things, least I be found to have buried my Talent received in the Earth.

3 Wherefore, Reason once shewed it self to my Soul, in the form of a more thick and dark little Cloud, or mist: and proposed; that it was the Nurse, Guide, and Tutorresse of the minde, so ordained of God, for the obtaining of all, even of solid good. Yea it protested, that it was the Sterne of the course of our life, the fore-deck and Sterne of the minde, and so the inventer of all Sciences. For at the first sight, my Soul entertained Reason, wished to rest in her possession, with well pleasing, in joy, and much rejoycing. Because the minde being so diligently instructed, had once so perswaded it self.

4 Nevertheless, least it should offend through a gentleness of credulity, or rash belief, it presently assaulted Reason with its own Weapons, saying, *If therefore O Reason, thou art ordained for my Service, I ought not to follow thee, but thou me. Because thou art she, which affirmest, or demonstratest nothing by Discourse, but I have first begotten that in thee. In what sort therefore dost thou, now being a Scholar, pretend a tutorship over thy Mistress, thou being a Daughter, over thy Parent?* That first Argument, arising from my arrogancy, taught me, that nothing is more nigh to the Soul than pride: which lifting up, nevertheless, arisen from disobedience, it hath covered with the Cloak of vertue: to wit, least it should be led away by credulity. But Reason answered, not indeed affirmatively; but onely, that it might breed a fear in the minde, and so, by scrupulousness, might draw it unto its desires.

5 For it said, there is no safety to the Soul, to be attained without Reason: to wit, that Morralls would perish under the allurements of the senses, unless vices should be restrained by the raines of Reason. To whom, the wrothful minde, saith: Away for shame, none of these things are from thee, or by thee: whose knowledge I receive from faith, and attainment or performance, from Clemency. Yea, Faith commands, that for her, we forsake thee. For thy flexible juggling deceit hath brought forth a hundred Sections, or divisions, and clefts in faith, even in the more refined men. But every Section, hath its rational induction, or bringing in of Sophistry. Because Reason doth on every side, bring forth onely a thinking, instead of Faith; but Faith is of Grace: not of thee, subtil Reason: who dost delude, and miserably lead aside the most witty, or quick sighted men, that trust in thee, unto a Hell of miseries. Finally, my minde considered by Faith, that there was one onely Form and Essence of truth; and that all understanding was alwayes, onely of true things.

6 Wherefore in the choyce, my minde esteemed it meet, to magnifie understanding before Reason. And therefore it began to fear, least Reason, which through a shew of Piety, Truth, and Religion, under a multiplicity of erring, did guiltfully deceive so many thousands of men, as a pleasing flatterers, and crafty Seducer should seduce it. And therefore, my minde suspected, that Reason did not onely feign perswasions, for the deceiving and flattery of it self, as oft as the minde did design it for a Judge and Assistant: but also, that Reason did plainly yield it self for a Parasite, and to the servitude of the desires, even of those that are most Religious: and did bring with it, more of thinking, rashness, and blockishness, than of Knowledge and Truth. Because it was that, which would easily be bended at a beck, by Tongues, sometimes to one, but some times to the other extreame: and would every where, finde out, feign, and prostitute Reasons, according to the pleasures of the desires: yea, it oft-times proceedeth in discarding of that which falls without that which is reasonable, and it remains indefinitely

definitely undistinct; and uncertain in ignorances, the which notwithstanding, it did promise to untie. Also, now and then, Reason hath made Souls mad, who trusting too much to its persuasions, had enslaved themselves unto it.

In the next place, in others, through foolish, importunate, indiscreet, and vain cares, it cuts off the thred of life. The minde therefore hath drawn a wearisomness from the command of Reason; and the rather, for that it knew Reason to be a Household Servant of its Family; but being a Chamber-maid, it presently did presume upon the whole government of the Soul. And the minde having remembered that divine word, that those of his own House, are his enemies: conceived a loathing over Reason. And its turning away on both sides, was not yet sufficiently founded, yet it got strength in going. From the first, therefore, after that, the Soul began no more to contemplate of Reason, as a part or power of it self; but as it were a strange guest, plainly divided, and a newter from the essence of the minde. And afterwards, the Soul knew that thing by faith, that it being once separated from the Body, it stands no longer in need of Reason: and therefore that this is frail and mortal; yea, and that it hapned to us together with death, in the corruption of Nature.

Indeed, the minde knowes that it is, after death, to inhabit all its knowledge at once, full, naked, not successive, not wrung out or extorted by force of premises, not conquered by convincement, not deceitful, disputable, or doubtful. Neither that it shall make demonstrations after death, that it may conclude, draw, compel, derive, or reflect, whether that thing shall be to conceive, or indeed to signify or give notice.

Therefore the minde seised on frail Reasons Coat, she being also a fugitive from the Soul, and hath spoiled her of every Garment, even unto nakedness: But then it was confirmed to the minde, that Reason being left with us, came to us, as it were, a brand from a tormentor, for a remembrance of Calamities, and of our fall. And that the knowledge of good and evil, attained by eating of the Apple, was Reason its very self, which is so greatly adored by mortal men.

Afterwards therefore, my minde endeavoured to depart, not indeed against, but from the use of Reason: to wit, by abstaining from all discourse, in the contemplation of a thing, as a thing is good, true, and a Being in act. But that thing I could not presently obtain, because Reason did continually accompany my Soul against its will, as a shadow doth the body, the which, without bidding, comes into the counsel of the minde, from an antient possession, and a not sufficient concealing of our counsel. And by this Title, the conversation of Reason was afterwards as yet, more burdensome, sorrowful, tedious and cloudy unto me.

For truly, then I began to perceive, that reason did vex the Soul with a multiplicity, with a vain complacency of Sciences, and did tempt with it a ridiculous enquiry after virtues, promising an Ornament of life, before the World, which doth adore its Starry Goddess Reason. Wherefore it did miserably draw the understanding and will into its pleasure, and did so load the memory, that even now, in my man-hood, my memory did fall as an Asse under his burden, and got a defect.

My minde therefore had often banished Reason, but it hath alwayes privily entred afresh, against the endeavours of the minde, hath discovered its learned Hypocrisie, and hath placed its batteries against the most weak wall of the minde. Indeed it hath alwayes promised a vulgar applause, the foolish rewards of ambition, boasting, that it is nourished under it. But then it first rose up against a strictness of life, against which, as against harsh Philosophy, and dissuaded from that, as follies, and fraudulently excused many things here and there, unlawful, with the privileges of youth, or of Custome already in many places received; and even readily serving for the flattery of the minde, it by a learned Industry, followed it as it were a Chamber-maid, feigning Reasons at the pleasure of the minde, now inclined.

At length, my minde asked, what knowledge Reason could give? Whereunto she presently answered, she could effect by the great art of *Lullius*, that a man may be able to discourse of every knowable thing, as it were an omniscient person, with the admiration of the whole World. Then my minde was wroth, and said to Reason, *Be gone wicked prattler*: for first of all, I detest discursive matters, therefore have I certainly known, that Reason doth alwayes forsake the Soul, with an unsweetness of dryness, stumbling in the dark with disquietness, uncertainty, and bitterness.

Last of all, as I knew, that there was no help to me in nature, nor seperation from so troublesome and tedious a guest, I hid my self within the Prayer of silence, so that sometimes, I could altogether, and now and then in part, uncloath my self of Reason,

and all its appendices. It happened therefore, that without, or at leastwise, besides those things, which may be known by reason, or be any way conceived by its help, I came down as it were by a Dream, under an unutterable light:

17 Or which, I have nothing to say further: because that envious reason hath presently withdrawn me from thence. For, as soon as Reason, being not yet mortified, waxing dim under the accustomedness of the light, had entered with my minde, it raised up an admiration in me, who I was, from whence, after what manner, and why I had come down thither: and so I fell out of the light, into miserable darknesse, under the day, or in the day-time. But in my judgement, that light was delayed, scarce the space, wherein any one might drawingly pronounce four syllables.

18 Nevertheless, from thenceforth, I felt my self changed from that which I was before. For I even tasted down the immortality of my Soul, the foundation of Faith and Religion, a knowledge that is to be preferred before all frail or mortal things. I proceeded therefore with a greater study, or endeavour, to depart from Reason: because it was that, which hath never assaulted me naked; but deceitfully covered with fighting, and deceitful juggles: but it had never truly forsaken me, but with uncertainty. *Salomon* calls the spirit of a man, the Lamp or Candle of God. But not that God is in darknesse, or that he hath need of the splendor of the spirit of a man. But altogether, because the hidden knowledges of things, are infused by the Father of Lights into us, by meanes of this Candle.

19 I apprehended more certainly, daily, that Reason was not that spirit of a man, and therefore neither that Candle of God. Yea neither the light of that Candle: but that there was a far different light of that Candle, by the vigour or efficacy whereof, it might pierce a knowable thing, granted unto it. Indeed, I thoroughly beheld, that the Soul was not in need of, yea, nor the framer of a Syllogisme, because it will not use it, being once severed from the body. For truly, its native knowledge, was far more noble, and certain, than any demonstration, which is the top of reason.

20 Then in the next place, I knew, that neither did sense frame a Syllogisme; but that Reason, the framer of demonstrations, did possess the animall understanding, or Imagination, which is a meane between the senses and the intellect. Wilt thou ask, why the light shineth? why the water is moyst? yieldeth to a finger that enters it, &c. and thou shalt finde, that, by how much the more clear any thing is, by so much the reason thereof is the more stupid, remote, and dull. Then therefore, I clearly beheld, that Reason is wallowed up and down, among thick darknesse. And then, that, where-soever there is no discourse, no premises; there also no conclusion, consequence, or reason, is found. Notwithstanding a knowledge of the premises, is more certain than of the conclusion: because, seeing it is supposed from things that are firstly or chiefly true: also that knowledge is in the Soul without Reason: because, before a demonstration.

21 Whence I concluded with my self, first, that reason doth generate nothing but a dim or dark knowledge, or a thinking. Then next, that the knowledges of the truth, of things, and premises, do proceed, not indeed from Reason; but from a far different beginning, to wit, the intellectual light of the Lamp or Candle.

22 Wherefore I straightway observed, that the discourse of Reason, doth extenuate or lessen, overshadow, hinder, and choak that noble act of understanding, whereby the knowledges of the premises, are implanted in us. And I learned more and more, that Reason was far of from, and moreover also, out of the light of truth, because like Bats, it onely cannot endure or bear the light, being content with its own borrowed Glow-worm light. Because it is that which is properly nothing else, but a wording faculty of discoursing, co-bred with us as mortalls, from sin. So that I say, it more wearieth the addicted or ready following Soul, by operating, and covers the Scull with Dogs hairs, than it is able to produce within us, a true knowledge of the truth.

23 Forasmuch as I have found, that the Soul wishing to know, by the hunting of Reason, for the most part, embraceth lying meanes, and false satisfactions, instead of the truth, for a reward of its labour. For thus the minde being deceived, beholds a lie, a false paint, deceit; and in summe, a thinking instead of truth, as long as it, as yet, doubts nothing of the juggles of Reason. For in this respect it hath happened, that there are so many juggling deceits, and false Doctrines, as well in Religion, as in the Art of Medicine, so that I cannot thorowly view any one corner of the Schooles, from whence truth is not overthrowen by the aims of Reason.

Therefore

Therefore, I have seen and learned, Reason to be a naked thing, because Reason, for every event, did bring forth nothing but a thinking of truth, by which meanes, it did bury the intellectual understanding. Because that the minde cannot at once, embrace and follow two lights, which are so diverse. But the World is every where miserably misled, and deluded by thinkings. And first indeed, because every one thinks Reason to be the Image of God, and our best Treasure, &c. I pray you, let a Reason be asked about a doubtful question, of ten witty men, apart: and mark, how much they differ from each other, every one is deluded by his own reason, and how stoutly every one fights for his own thought.

For truly, seeing my minde, did spoil reason of its Garment, I observed, that the World is chiefly deceived, by its own thinking; because it calls the inquisition of the knowledge of things by their causes, the seeking out, or invention of reason. But therein, I have first of all discovered the false paint, and most wretched condition, and most poor nakedness of Reason; because it blusheth to appear, unless under the covering of a false Etymologie, or pretended true reasoning, or derivation of words, and a begged Cloak. For truly, Reason is by no meanes, a cause, part, or essence of the thing caused, much lesse doth the rational faculty in man, reach unto things. For a thing is that in it self, which it is, without the reflexion of it on any discourse, and invention of humane reason. Therefore the outmost Garment of reason is a Mask. Indeed, the cause is the beginning, and original of the thing caused. But reason is no such thing. In the next place, I have observed, that the Schooles gave Reason place, in the middle of the essence of the minde; and that from thence, they did denominate the Soul to be rational, as it were by an essential property. As though reason should be given to it for a Lamp, or Candle, in the innermost essence thereof. When as, otherwise, in very deed, in the minde, or the most immediate Image of God, there is no room for reason. Because, the Soul being seperated from the body, doth not use the discourse of reason. Yea, when the Soul, being as yet the inmate of the body, doth intellectually understand any thing, it plainly refuseth all use of reason.

Because that when it makes use of reason, it plainly resembles the favour of a corporeal Soyl. Seeing the rational power is in the lower part of the Soul, as being bound with bodily Fetters. Finally, presently, after the uncloathing of Reason, it offered it self as alike frivolous a covering from, the thinking of reason. To wit, that whatsoever is akin to truth, this reason judgeth reasonable, and agreeable to Reason.

When as notwithstanding, Reason and Truth are unlike, or disagreeing in their Roots. For Truth is a real true Being; but reason is a mental, problematical, or intricate Being, onely appearing: for hence the [being of reason] a [non-being] hath arisen from its Mother, Thought. For the rational faculty, and reason derived from thence, doth oft-times embrace false things, for true, and true things for false.

Whence at length, I seriously considered, that reason did not agree with the conformity of a thing proposed by discourse, and the knowledge of a conclusion found by us. Because reason properly, is not the judgement of the outward man, or of his imagination, whereby it rubs together, truth, appearing unto it self, according to the shapes, or figures of Sciences, which are supposed to be inbred in man: from whence it wandering, the Imagination doth then first frame a knowledge agreeable to it self.

But Reason, that Steward, reputed in the minde of so great worth, is nothing else, but a disposition of the aforesaid conformity, found by discourse, with the shapes, or Ideas co-bred in the Imagination, which conformity in the next place, as it is in it self, confused, obscure, moveable: So of necessity, it ought to be unstable, from the nature of the Subject of its inherence. For so also, the most refined Reason may be in it self deceitful: neither must it be of necessity, that it should compel, contain, or conclude any certainty within it, Mathematical Science excepted: because this doth plainly consist in the measurings of co-measurable things.

For therefore more Heretiques are converted by the Examples of a Christian life, than by the Discourses of Disputations. Next, the aptness of that Disposition unto the Species, or Shapes co-bred in the Imagination, is reckoned to be, rationality or reasonableness.

But reasoning, or Logisme (from whence is a Syllogisme) is an act whereby the conformity of the same disposition, is made to approach unto the Species, co-begotten in the Imagination, or as my opinion carries it, finally raised up, or awakened there. As soon as by putting of the shoots of reason, I found most things to be in nature;

which the understanding judgeth necessary, the which Reason refuseth as impossible: I knew from thenceforth, that reason did not dwell in the possession of a true understanding; but without the same. Because that in the understanding, truth is immediately: because truth being understood, is nothing else, but a suiting of the intellect to the things themselves.

32 Indeed, the understanding knowes things as they are; and therefore likewise, the understanding is made true concerning the things themselves, by the things themselves; forasmuch as the Being of things from themselves, is alwayes true: and their Essence is truth it selfe. And therefore the understanding which is carried about them, or brought over them, is alwayes directly true. But seeing the imagination, or the reason thereof, is a certain crooked manner of understanding, proceeding by Reasons and Discourses; but not by a transformation of adequation or suiting: therefore that rational manner, is an abusive and deceitful understanding. But good, right, one, and true, have themselves alwayes after one and the same manner, in the intellect; because they stand alwayes in one point of suitableness in the intellect: but evill, crooked, awry, false, and manifold, are made after many manners, by reason, in the imaginative part.

34 Therefore I have certainly known, that reason is not to be had in so high an esteem, as hitherto it hath been. And the rather, because Reason and Discourse, do not obscurely flourish, or grow in brut Beasts: for, that an aged *Fox* is more crafty than a younger one, by rational discourse, doth happen to be confirmed by the remembrance of experience: yea, *Bees* do number: because if there be 30 Hives placed in order, a small *Bee* flying out in the morning, numbers out of what Hive she went forth, and then, doth not return nor enter, unless she first re-number the rank: which is easily proved; For if the fifth or sixth Hive, be removed into the seventh, or any other place, and the number being turned in and out, the *Bees*, which return laden with Honey and Wax, thinking to lay up their fardle within their own Common-wealth, do reckon again, upon the fifth or sixth numbered Hive: the Citizens whereof, seeing they are strangers to that little *Bee*, coming unto them, do kill the same. And in this manner, Thieves do in one night, destroy all the Hives. For the Serpent was more crafty than the other living Creatures. And I will confirm by one example, instead of a thousand, a rational Discourse in Beasts. A man of a neighbouring Village, brought up a Hound, the chief Watchman of the night-prey. But it happened, that in full of the Moon, a Wolf, ran up and down about the Village, at whom, that Dog, straightway barked, and followed the fleeing Wolf. But this being impatient of hunger, retorted himself on the Dog, and followes him. But the Dog running away, and leaping upon his Oven, retired himself in safety, and from thence continually barked; and waking his Master, discovered the presence of the Wolf. But the day following, the Wolf returned, whom the Dog, as he did the day before, assaulted by barking. For the Wolf feigning a flight, until he knew by conjecture, that his fellow Wolf, which he had brought with him, had hidden himself under the Oven. When therefore, he turned himself towards the Dog, who running away from the Wolf following him, and thinking to retire to his Oven, as it were to a most safe Castle, another hidden Wolf bewrayed himself, who laid hold on the Dog with a grinning mouth, and hindered his leaping upon his Oven. Therefore I have noted a remarkable diligence in all brut Beasts, also in most insects.

35 I think it therefore a disgraceful definition, whereby a man is decyphered to be a rational or reasonable living Creature, as it were from a description of his Essence. For truly, he was to be defined from his ultimate end, by the properties of appointments in creating, if the end be the first of causes, according to *Aristotle*. Wherefore, neither was the definition of a man, to be begged from the Fountain of Paganisme, which hath been plainly ignorant of Creation, and the ends thereof. For as my Philosophy is unknown to the Heathen, so likewise their Philosophy is with me, of no value. Indeed, I write for the sake of Christians, for whom it is a shame, to follow Heathens, contrary to Gospel-truth. Neither also am I willing to be accounted a brawler about names, as oft as I treat of the ends, Prerogatives, choiceness, and Dignity of the divine Image. I reject, first of all, the follies of Paganisme, in definitions, especially those made concerning man. For truly, according to the Testimony of *St. Anthony*, described by Blessed *Jerome*: *Paul*, the first of *Anchorets*, is referred among the number of the Gods. Also by relation of the same *Anthony*, *Faunus* is read to be a talking rational Creature: yea, knowing and worshipping the God of Nature, and of the Christians, and

and beseeching *Anthony*, to pray for him and his. It is manifest in the first place, that this *Faunus* was not a man, from the assertion of *Anthony*, and his monstrous figure or shape. Next, neither that he was an evil Spirit, is gathered, because this is so proud, that if he knew he might be saved by Prayer, he would not so much as ask, that any one would pray for him, neither would he prostrate himself for to beg pardon. For blessed *Jerome* calls *Faunus*, not a man, as neither an evil Spirit. Therefore *Faunus* is neither of these, as the same man witnesseth, by whom that *Paul* obtained the first place among the *Anchorets*, and was reckoned among the Saints. Therefore a *Faunus* is a living Creature, as a Being in reason, speaking his own proper Country Dialect; but not a man. So in times past, a live *Satyr*, and afterwards seasoned with Salt, was shewen for money, being carried thorowout *Egypt*, *Phrygia*, and *Greece*. Finally, in *Scotland* and *Zeland*, and elsewhere: there are fished Monsters, using Reason, yea, exercising mechanick arts, in the half shapes of men. Indeed man alone was made after the Image of God, with an excluding of all Creatures or things. But these rational brutes, being in their own Elements, are also different among themselves: yet are they the Images, or likenesses of us, and not the Images of God.

Man therefore, is a Creature living in a body, by an immortal minde, scaled to the honour of God, according to the light, and Image of the Word, the first example of all causes. For the day, and its light were sometimes without the Sun, and the Sun shall at sometimes be without light. But the Soul of man, cannot be considered without the Image of God, seeing the Kingdom of God, with all its free gifts, is more intimate to the Soul, than the Soul it self is intimate to it self. Therefore, I am deservedly angry, that the Schooles do badly season Youth, with Heathenish Philosophy, and that they do even till now, delight in Acorns, the Banquets of the first, or original truth, being now found. *Oh Lord, the light of thy countenance is imprinted upon us*; for none hath perfectly known the Image, and whether it doth well answer to its Type, if he shall not first know or acknowledge the Type. Wherefore, as many as do badly define a man, do not know or acknowledge God, as neither themselves in essential things.

The Philosophical Schooles therefore, have rested more in the lessons of the *Heathens*, than of *Paul*. Hence I contemplate, that they have meditated of a man, onely according to his dead Carcase; but not according to the intention of the Creator, or efficient, and the finall ordinations of man. For otherwise, the Almighty, had declined from his scope, if the end be the first or chief of causes, in Creation, and there be something considerable, as first, in the adorable Authour of things. Therefore the Creature was to be defined, and that from the intention of the efficient Creator. For he erreth not in his ends, who frameth the properties themselves, which flow from the very ends of their appointments. Wherefore, man, although he hath from his body, some animal or sensitive, and bodily conditions: yet, from the intent of God, he is created into the living Image of God, in an immortal substance, that he may know, love, and worship God, according to the light of the Type or figure imprinted on him. But after that man hath lived in the flesh, as an animal or sensitive living Creature, God hath said, *My Spirit shall not remain, or alwayes strive with man, because he is flesh*. For the proper Genus or general kinde of the thing defined, in the definition of a man, which the Schooles name an Animal, or living Creature: that very thing, God nameth degeneration, a turning out of his wayes, the corruption of Nature, and destroying of his intention in Creation. But, that their constitutive difference of a man, or the rational part, doth belong to brutes, is without doubt: and also the penury of *Logick*, which is altogether destitute of all definition, and constitutive difference. But Reason being now stript even unto a nakedness, I got its every way displeasure, because it seemed to me an empty Skeleton, its Masks and Coverings being taken away.

Lastly, I beheld the narrow poverty, and unquiet foulness thereof; especially, when I was mindeful of the confusions and uncertainties, wherewith, it, according to its wonted manner, had intangled me.

I began therefore afterwards to contemplate, that my intellect might more profit by figures, likenesses, & visions of the phantasie in dreams, than by the discourses of Reason. Yea, that frequent Discourses did ordinarily render their man, foolish, wrathful, mad, stormy in his judgement, and moveable, or weak, and so also of a tender health. And at length, I more fully looked into the progress of figures and Ideas: and then I found those, as yet, encompassed with miseries and anguishes: because Images were estranged, by reason of their adulterating from the very truth of the thing, and of its Essence, by an unexcusable disagreement of every Similitude, remote from identity.

identity or sameliness. And then I thus judged, because the distinction between the Images of the Phantasie, and the Images of the intellect, had not yet been made
 41 known unto me: the which, after their abstractions, do remain in the very Centre of the Soul; for I was for the most part wearied all the day, about some knowable thing; the which, although it was unknown to me, as to its foundation and manner, yet by likenesses, I determined, it was by much labour to be known unto me. At length, when I perceived my self to be hindered from further proceeding, because astonished, I framed inwardly, that any likeness of a thing not yet perfectly known, is adorned with a possible adiacence of its essence.

42 Under which, I once afterwards, ere long, beholding that, in my imagination, and as it were, talking to the same, I being at length, notably wearied with study, fell asleep, that at least, I might stir up a dreaming Vision, whereby I might draw out that desirable thing to be known. According to that saying, *Night unto night sheweth knowledge*; and surely it is a wonder, how much light, those kinde of Visions unfolded unto me, especially, my Body being not well fed for a good while before. For I do not deny, but that, the essences of the thing sought for, which were for the most part, covered under the Cloak of a Riddle, or confused; and as yet, very much subject to pluralities, and interchangeable courses: I many times attained by this meanes of knocking, especially, the helps of seeking having gone before, and the ayds and wings of prayer, being adjoynd. And a holy man (to whom, I had uncovered every corner of my Conscience, and the wearisomnesses of labours and years through restless nights) said unto me: *Ah, I would to God, I had laboured as much, and had spent as much time in loving of God, as thou wretched man hast done, in the searching out of knowable things, whereof, the last day will not require of thee a reason or account!* Truly, I then praised the Lord, that he had freely bestowed on me a certain nearer meanes of knowing and learning, than reason could be: the which did never pierce unto the former, or cause, and seldom unto the latter, or effect, and that, moreover, with much uncertainty. For then, I believed, that the original misery of corrupted nature, could not proceed further, unto the once tasted light, than by the afore said Images of the phantasie.

43 By the perswasion therefore of that man, I desisted from a more narrow wishing, seeking and searching into any thing, I stripped my self of all curiosity and appetite of knowing, I betook my self unto rest or poverty of spirit, resigning my self into the most lovely will of God, as if I were not in being, not in working, in desiring meer nothing, in understanding nothing: most especially, because I knew manifold imperfections in my knowledges; I conceiving great indignation with my self, because that for a frail knowledge, I had bestowed so many and so great labours. Therefore I my self wonderfully displeased my self: therefore I begged of the Lord, that he would wholly sweep out of my minde, every knowable thing, and the profane desires thereof: the which minde, with this inscription, I wholly offered unto his good pleasure. In the mean time, after two moneths, in this renouncing of knowledges, and naked poverty, it once again happened unto me, that I intellectually understood. I placed my Athanar, or the Instrument of my reception and operation, another way.

44 But I straightway returned into my self, neither knew I, how long that light had remained. That indeed I knew, that the newness, amazedness, and rejoycing of the unwonted matter, then stole away that light, and made me to fall out of it, into my antient confusions of darknes; because that reason was not yet mortified. *Aristotle*, although he was wholly void of this light, yet he hath seemed from some other, to have described the perceivance of another, concerning the labour of wisdom, or things Adeptical. *It is better for a man to be disposed or inclined, than to be knowing by description.* To wit, by the deaf suggestion of another, he calls it a better thing to have men disposed, than if they were knowing: that is, by the help of demonstration. By meanes whereof alone, he elsewhere alway boasts, that all knowledge in man, doth arise. I likewise acknowledged, that we must bid farewell to Reason and Imagination, as unto brutall faculties (and that by reason of the misery of our fall) if by hope, we are drawn into the deep, for a sound knowledge of the truth.

45 I have known likewise, that an easie Translation of the understanding was required, and a pleasing transchanging of it self into the form of the thing intelligible; in which point of time indeed, the understanding for a moment is made (as it were) the intelligible thing it self. But seeing the intellect is perfected by understanding, and that nothing is perfected, but by that which hath a resemblance with it in its own nature;

ture; therefore I gathered that the understanding and things understood, as such, ought to be, or to be made of the same nature; but this ought to be done without labour, and disquietness: but with rest, in the light proper to them, with the withdrawing, depriving, and wanting of any other created help whatsoever. But if a forreign help doth concur, now, it shall be with the labour of a desire stirred up without the understanding. Furthermore, that passing over and transfiguration of the understanding, otherwise natural to it, they do signifie to be sometimes subordinate Poets, the name of *Prothens*, even as a Fable. But I have now known more clearly than that, that that transchanging of the understanding ought to be made, because the intellect is in it self, wholly pure, simple, one onely, and undivided.

Wherefore, for that cause also, some onely, simple, uniform, and single act, should belong to it, plainly undivided from the understanding it self. Otherwise, the understanding should loose the homogeneal simplicity of its unity, by a duplicity of interchangeable course. Notwithstanding; I have sufficiently found, that it is not of the full and free power of our will, now thus to enjoy its own understanding. And that there is more required unto that thing, than to think, endeavour, wish, will, &c. And that not onely by reason of an accustomedness, whereby, we have been wont from a Childe, by animal or sensitive acts, to obey the Imagination: but much more, because the will it self, together with the memory, ought for that space of motion, to be wholly supt up, and as it were, annihilated in the understanding.

The which surely, is the weight of a great Mystery. For else, as soon as any one doth think of his Soul, or of any thing as of a third, with a seperated interchangeable course, without the understanding, for that very cause, there is not yet the thought, or operation of a pure, and onely intellect.

But when the Soul thinks of it self, or any other thing, as it self, without an interchangeable course of the thinker, and of the thing thought of, without an appendency, out-turning, or respect to duration, place and circumstances; Then indeed, such a thought is intellectual, or of the understanding. But it is not as yet, therefore illustrated, or made lightsomely famous, although that understanding is already a far more noble thought, than that which rusheth in by things that happen: whether those do come in to it by likenesses, without a sequel, as being infused; or next, being drawn from experiences and observations, do by influence, flow to it of their own accord. Because the Soul, in that state of light, doth thus apprehend the more inward and formerly essence of the thing understood, because the intellect it self doth transform it self, by passing over, or thorow, into the thing understood. Hence indeed, it follows. If intellectual knowledge be with a similitude of the thing understood in the understanding it self: that also the Kingdom of God, doth as it were come to us, and is renewed, or doth spring again, as oft as we in faith do intellectually and presentially adore the goodness, power, infiniteness, Glory, truth of God, &c. in the Spirit: And thus it is unto God a delight, to be with the Sons of men. Surely it is thus. Our understanding is as it were all to be sprinkled with a new dew of perfection, as oft as any thing that is super-celestial or heavenly above, is intellectually contemplated of: because for that moment, it passeth over into that, and tasteth down that.

Then indeed, the Image of God shines all over within, and becomes glorious. Good God, whitherto dost thou bring mortalls? But surely, such an intellectual thought, is not made with a distinction of words, or properties of speech: neither with the girding of the senses or reason: neither with a certain more swift conception of a whole Discourse, abundantly drawn in; nor with a dependance and sequel of things before thought of: nor being environed with circumstances, of here, now, white, great, bitter, like, pleasing, &c. But one is not in the understanding without the other: neither with the other under an interchangeable course: neither also, even as it may be conceived by Reason, or Imagination, or be thought by Imaginations or likenesses. But in that state, now, here, sense, reason, imagination, memory, and will, are at once melted into a meer understanding, and do stand obscured under darkness, by the light of understanding. Then, then I say, a certain light falls upon the Soul. And that in my judgement, is all of whatsoever could ever be declared by word, thought, speech, and writing. But whether that light be altogether supernatural, or that the understanding be of its own nature thus kindled, or enflamed, I had rather experience than determine. That one thing at leastwise, I know, that it doth not happen without grace. Wherefore, whether the understanding be transformed, or whether it doth transform it self into the Image of the thing understood, surely it had need of help from God, and

and that indeed a singular one, because then, at leastwise, the Soul beholds its own understanding, under a form taken on it, in the said light; and in that its glasse, it beholds it self intellectually, without a reflexion of interchangeable course; and so it conceiveth a knowable thing, together with all its properties. For that, this light of knowledge, is not that which issues out of the understanding, but remaineth within, reflexed upon the understanding, which may be perfected in all truth, and perfect certainty.

51 Indeed, some *Rabbins* do fear this state of the Soul, as dangerous. The mystical School also feareth the danger of arrogancy, and spiritual adultery. But both, as they do avoid or shun that which is hurtful. And the *Adeptists* think, if it should often invade one, or long continue, undoubted death would be brought, together with a sickness, which the *Rabbins* call *Binsica*: which properly, is an unnourishment, or pining away of the Organ of the phantasie. Notwithstanding I pray, let them pardon me, if I shall think otherwise. First of all, because the Instruments of the Imagination do not labour in this act: but they sleep unmoved, as if they were not. Therefore likewise, they suffer nothing. Then, because that act, is not in our power: for I believe that that principal act, is of Clemency. Which Clemency, doth never give, make, cause, or admit of that which is inordinate. Therefore, although Clemency should the more often, and longer abound, yet neither therefore, could it contain, or argue an inordinacy. I beseech therefore, that the Father of Lights would vouchsafe, to prevent, and follow me with his clearness, that he may bring me unto the calling which is pleasing to him, in his grace. The light therefore which falls from above, upon the Soul (when it is less tied and bound to the Organs of the Body, and the which is in it self not capable of suffering, and immortal) cannot also, hurt the life. For truly, after the receiving of a small quantity of the light, I finde a man scarce to suffer any thing by three dayes fasting. Wherefore it comes into my minde, that the friends might stand by *Job*, as Companions, for the full nine dayes, without meat or drink. Moreover, according to my opinion, that light, doth so dispose of the understanding, without the help, endeavour, and labour of the understanding, that it may come into its own freedom, which else, through the slavery of the body, is plainly moveable, dark, and confused. Otherwise, the understanding makes not use of Instruments, besides and without it self. And therefore, neither is it wearied, as is the Imagination: neither is it of it self, subject unto Diseases, changes, disturbances, alterations, interchangeable courses, or co-mixtures.

52 For error, juggling, a lie, or deceit, doth not fall on the understanding, while it stands in that light. For neither do, drowsiness, sleep, or defect, inhabit in it; neither doth it receive aid from any created thing, as neither from the body, reason, or any imaginary power: but it carries its own native light, above all the circuite or ambush of Reason. Yea, which is more, the understanding is not then provoked, by any power more inferiour than it self, nor from the things themselves, even as they are known, subject to deceit, a juggle and lie: because they are those things which stand in the nakedness of their Being before the understanding, that they may be as it were informed by this, and in passing over, be quickned. All things therefore are in such a manner in their understanding, that all things of the Soul are their own intellect. Yet so, that although the understanding doth by an intellectual act, transform it self into the likeness, or kinde of the thing understood: yet it keeps its own property and essence, unintermixed: whereinto it again returns, as soon as it hath ceased from that act: indeed, the Soul possesseth this Prerogative from Clemency, that it may be the Image of God: and therefore a simple created unknown light.

53 So that, as oft as it conceiveth any forreign thing in it self, it ought of necessity, to desist from the Being of a most simple light, of the divine Image, or to transform it self into the figure of the thing conceived. So indeed, as that the essence of the thing conceived, is a naked essence, and yet essentially in the understanding, even as an Apple in the kernel of an Apple. Hence therefore, it comes to passe, that intellectual knowledge is void of all error. Because Reason is absent, which doth every where, make us to stumble. For essences do stand naked, and unclothed in an intellectual conception: the which, as such, the Soul, therein, doth now behold in the glasse of its own understanding, as while the Eye doth behold it self in a glasse, in its own reflex beam.

54 Therefore it is reputed for truth, that it is no Eye, except so far as it is conceived in the intellect as such. Wherefore *Aristotle* was constrained to confess, that the principles of understanding, are wholly the same. That is to say, that the truth of Essence,

essence, and the truth of an intellectual knowledge are one and the same. And therefore, as a Being, or to be, true, good, and one, are convertible: so essence, goodness and truth, ought to be co-melted with each other, into the form of a Being, in the oneness of understanding. For truly, in the understandingness of the understanding, there is not any interchangeable course of the intellect which understandeth, and of the thing understood: because that, before the act of understanding, every reciprocal or mutual relation, rebounding, and reflexion on each other, is first nullified. Seeing the very understandingness of a thing, is nothing but a coming to, and immediate approach of the unity of the understanding, and of the thing understood: or a destroying of interchangeable courses in a relation. The which, that it may be made more clear by an example; the understanding intellect, is no otherwise different from the thing understood, than as a beam of light which is direct, differs from it self, being reflexed. Therefore the essence of a thing understood, in the light of understanding, is made a spiritual and essential Splendor. Yea, by a co-passing unto a unity, it is atter some sort made the light of the understanding it self. That which cannot happen to the Souls of brut Beasts,

55

Therefore also, our Soul understanding it self, doth after a sort, understand all other things, because all other things, are in an intellectual manner in the Soul, as in the Image of God. Wherefore indeed, the understanding of our selves, is most exceeding difficult, ultimate or remote, excellent, profitable, beyond other things. For a man knowing the divineness of his Soul, he cannot but preferre the same before any kinde of decaying and filthy pleasures, and those of no value.

56

But the difficulty of the aforesaid understandingness, doth chiefly consist in that, that it is the Image of God, which very Image also, as well in it self, as in respect of the Type which it resembles, is almost impossible to the understanding. And then, the Soul not having in it any Image of it self, distinct from it self, it cannot at all understand it self by Idea's or resembling likenesses. But seeing it is simple and uniform, neither can it understand it self in an Image; neither also is it agreeable or convenient, that by reason of the highest and homogenial simplicity of the Soul, it should make use of divers manners and meanes of understandings in understanding, in respect of it self; and again, of other manners and meanes, in respect of other things understood. Hence of necessity, the soul, for the preserving of its own homogeneal simplicity, due to the Image of God, hath whereby to understand all other things, without a shape distinct from the things themselves. But seeing the Soul wants a proper shape of its own divine Image, that it may transform it self intellectually into it self: Therefore it cannot properly understand it self after an intellectual manner, but in the light, and faithful witness of him, whose Image it is. For the knowledge which we have of God, is of Tradition, Faith, and so of merit. Although it be plainly negative, as it is not this or that, which may be conceived by the sense, or minde. And therefore, the knowledge of the Soul, as of the divine Image, hath a negative abstraction, or withdrawing of other things adjoynd to it, which it calls, *non ens*, or, a non-Being; but of a non-Being, no conception, no figure, and no understanding, doth answer. That is of a negative abstraction, seeing its companion is privation; but negative and primitive things are destitute of an Idea, or equivalent shape: therefore the light of knowledge which the Soul hath of it self, is of clemency, freely given, nor ever at the full in this world, or life. But if a happy Soul shall sometimes conceive of God in it self, by the beatifical Vision, then by the same beam of light, he shall behold and know God himself, and all other things inwardly. For therefore, by how much the Soul doth understand intellectually, of it self; by so much it profiteth in the most profitable knowledge which can be had of created things in this life. Because that in the light of its own light, it doth after a sort, behold the properties, essences, effects, interchangeable courses, distinctions and defects of all things: whither therefore, that knowledge hath once brought, there, all the more cloudy speculation and aid of Reason languisheth; even as on the other hand, a true understanding is suppressed in us, under the precepts of Reason.

57

Wherefore, seeing the proper object of understanding, is the essence of things it self, for that cause, accidents being as it were abstracted, and rent asunder from the things in which they are, ought to be conceived by the imagination, and that by shapes and likenesses: but in no wise, by the understanding. Wherein, after another manner, I finde all accidents co-knit together in a point, under the essence of the things understood. Because accidents properly are not Beings: but of the Beings on whom they

58

- they depend; therefore accidents have not an essence, which doth co-pass unto the unity of the understanding, or into which essence, the understanding may transport it self. But the Schooles do divide the Intellect into the Agent and Patient: 59 For they will have that to be conversant about the invention of meanes, and premises of a demonstration; to wit, that the sealing marks of the termes, may imprint an understanding on the Patient, as it were, on wax subjected to it. Therefore they call the Agent masculine, noble, and formall. But they liken the Patient to the Woman, and ignoble matter. And these their Dreams they perswade to young beginners; as Nature doth every where operate toward the perfection of it self: but operation or action is alwayes more noble than passion or suffering: But I do every where pity so great dryness. First, because demonstration is not an effect or of-spring of the understanding, neither doth it any way supply meanes for Sciences or knowledges. I have seen an *Ethiopian* swiftly to roule a Reed about, in the hole of a Plank, with a Towel placed between: and not long after, the Reed with the Towel took fire. And then, I have hidden a Reed in a bright burning Fornace, and the inflamed Reed, hath more speedily, cleerly, and perfectly shined. When as, nevertheless, the Reed did act nothing: but onely suffered an inflaming. So that, although the acting principle, may now and then be more noble than the suffering one, while the effect tends to perfection: or while the Patient ought to be perfected by the Agent: Yet while a pretious Pearl doth putrifie under the Dunghill, I may not believe the Agent to be more perfect than the Patient. I have sufficiently shewed elsewhere, that in whole nature, the Doctrine of *Aristotle* is vain, and meer trifles: how much lesse therefore could he subsist in the Court of understanding? whose Being and operating do depend onely on the Soul? For we Christians, are constrained to believe, that our intellect or understanding, is an immortal Spirit, Light, and Image of the Almighty, whose beginning, as it exceeds Nature, so it cannot be fitted, or squared to its Rules: Seeing it hath a most simple Being, never to be divided into the strifes of Agent and Patient, or into heterogeneous, or divers kindes. Seeing also that it dependeth immediately, totally, and continually on its original Type: and so that without particular or special grace, it cannot understand any thing: because the object of understanding is truth it self. Wherefore neither doth it understand with a perfect understanding, but by receiving. But that which receives onely, that suffers, but doth not act therein: for neither is that proper to the understanding, which comes to it by grace. The will also, while it suffers, is more noble, than while it wills: to wit, while it is ruled by the will of the Superiour Powers. The Imagination indeed, knowes by acting, and therefore it is wearied, and this *Aristotle* knew: but not the understanding. Because it is that which suffers (in understanding) by way of enlightning onely. For it is a more troublesome, servile, and obscure thing, to operate in understanding, than to suffer: because, by suffering, it receives a more noble light, freely conferred on it.
- 60 Lastly, seeing that in understanding, it alwayes passeth over into the form of the thing understood: therefore that which partakes of an unlimited light, is perfected without weariness and labour of understanding, and the light understood, shineth, in understanding, in the light of the Intellect it self. So as the things themselves, seem to talk with us without words, and the understanding pierceth them being shut up, no otherwise than as if they were dissected and laid open.
- 61 Therefore the understanding is alway perfected, by suffering and receiving. But the imaginative knowledge or animal understanding, which was known to *Aristotle*, beholdeth things onely on the outside, and frameth to it self Images or likenesses thereof, according to its own thinking; and with all wearisomness of labours, runs about them into a circle.
- 62 It sees indeed, the Rhines, and husks, but never reacheth at the kernel: because the Imagination doth not enter things; as neither on the other hand, do things enter and satisfie the imaginative part. For at most, the imaginative part, satisfies it self by likenesses, if it hath long admired the outward Signate: the inward sealer whereof, notwithstanding, it least of all embraceth.
- 63 For how unjustly doth it square, that the Schooles should acknowledge the Soul to be the immediate Image of God, and to divide the understanding, into two supposed things, which differ in Offices and effects? For truly, a two foldedness it self in the understanding, disagreeeth with the simplicity of him, whose Image it hideth in it self, throughout its whole Being. I believe in the first place, that nothing doth pertain

pertain to the knowledge of truth, but faith and understanding. Secondly, That all truth doth issue from one onely and primitive truth. Thirdly, That all understanding deriveth it self, from one onely, and infinite understanding. Fourthly, Even as all Light from one onely Light. Fifthly, Therefore that the Essence of truth doth nothing differ from the Essence of the understanding. Sixthly, That our understanding is vain, empty, poor, and dark. Seventhly, That all its clearness, nobleness, fulness, light and truth, do come to it, by receiving and suffering. Eightly, That it is so much the more ennobled, by how much the more it suffers by the light, which is beyond all nature.

Finally, the Schooles of the Heathens have failed of the knowledge of a true understanding. And therefore, man is not a rational living Creature. But the predica-
ment of a substance, is to be divided into a Spirit and a Body. A Spirit is abstract, or withdrawn, or concrete, or joyned with a Body. Man alone is a concrete Spirit, but not to be placed among Bodies. If his denomination be to be drawn from the more especial part: and essential determination, from the more famous thing signified. Therefore man was to be denominated and defined from a Spirit, and an intellectual Light.

CHAP. IV.

The Causes and beginnings of Natural things.

1. The Authour excuseth himself, why he is Paradoxical.
2. Some Bodies want causes in Nature.
3. A fourfold order of Causes, makes manifest the ignorance of Nature in Aristotle.
4. Some Errours of Aristotle.
5. That the form, the efficient cause, and the end of Aristotle, are not the causes of natural things.
6. The Form is not the Act.
7. A false Maxim of Aristotle.
8. He erreth in the attributes of the Form.
9. He knew not the true efficient cause.
10. The Father is not the efficient cause of the Son.
11. There are two onely causes in Nature.
12. The End hath no reason of a cause in nature.
13. That the three beginnings of Bodies, of Paracelsus, have not the nature of causes.
14. Whence the definition of any sort soever of natural things is to be required.
15. The definition of a Horse.
16. The division of sublunary bodies among the Auctients, is dangerous or destructive.
17. The definition of Animalls, Plants, and Mineralls.
18. The name of Subject, sounds improperly in Philosophy: why 'tis to be called a co-worker.
19. Things without life, that are produced, how they receive their ends.
20. Why the seminal Power is attributed to the Earth.
21. That there is not a conjunction of the Elements.
22. The Principles of the Chymists, have not the power of principiating.
23. That there are two onely Principles, or beginnings of Bodies: to wit, that from which, and by which.
24. What the Ferment or Leaven of things is.
25. What are Ferments in their kinde.
26. What is immediately in places.
27. The Ferments of the Air and water.
28. There is onely a speculative distinction of the Ferment, and efficient cause.
29. The Ferment is the original of some seeds.
30. The principiating Ferment of what sort it is, and where.
31. Ferments are immediately in places, in things themselves, as if in places.
32. The name of matter is speculative; but that of water is practical.
33. What the inward efficient cause is.
34. A false Maxim of Aristotle.
35. The efficient cause in natural things is explained.
36. Fire is not of the number of seminal efficient causes, as it hath deceived the Aristotelicks: neither is the influence of the Heavens among the number of efficient.
37. The diversity of the efficient and effective cause.
38. The wit of Aristotle is ambitious and idle.
39. A false Maxim of Aristotle.

40. Aristotle was more able in the Mathematicks, or learning by demonstration, than in Nature. 41. How great hath been the ignorance of the Schooles in natural things hitherto. 42. Aristotle is in the things of natural Philosophy ridiculous, and to himself contradictory.

1 **I** Come into a forsaken house, to re-melt the dross that is to be swept out by me. Most things are to be searched into, and those things to be taught which are unknown; those things which have been ill delivered, are to be overthrown; what are unclean, are to be wiped off, and what things are false, are to be cast away: but all, and every thing, duly to be confirmed. But let it be sufficient to have forewarned thee of these things, to withdraw wearisomness, if happily new and Paradoxall things do more trouble, than true things delight. The knowledge of Nature, is onely taken from that which is in act, and in the thing it self: for it is that which no where consisteth in feigned Meditations. Indeed, the whole composure of Nature is individual, in very deed, in act, and fastned in any Body, except the number of abstracted Spirits.

2 Lastly, and chiefly, I seriously admonish, that as often as I speak of the causes of Natural things, these things are not at all to be taken, for the Elements, or for the Heaven: because they supernaturally began with the Title of Creation, and to this day, do also constantly remain the same which they were from the beginning. Therefore I understand the causes of natural things, to presuppose a Being subject to change. And although the Bodies of the Elements have come under Nature, yet their speculation is of another manner of unfolding, and another kinde of Philosophy. For
3 they who before me have thought that to all Generations or Births of Bodies, four Elements do co-mix, have beheld the Elements after the heathenish manner, & have tried by their lies, or devises, to marry the Elements, & obey them. Therefore every natural Body, requireth no other than corporeall beginnings, for the most part subject to change, and succeeding course of dayes; but Nature doth not consist of an undetermined hyle or matter; and an impossible one, neither hath it need of such a Principle, as neither of privation: but order, and life, are in the efficient cause, of necessity. And every thing is empty, void, dead, and slow, unless it hath been constituted, or sometimes be constituted by a vitall, or feminal Principle present with it. And moreover, those Lawes should rush down together, unless there were a certain order in things, & which did interpose, which might incline proper things to the support, or necessities of the common good. Aristotle hath declared four constitutive causes of things, which have made also their own Authour ignorant of Nature. For in the first place, he confoundeth the Principle with the material cause, to wit, calling the first cause an undetermined, or unlimited matter, or a corporeal subjected heap, wanting a formall limitation. And then he confoundeth the other cause, even the inward Essence, or form of a thing with another of his Principles. Next the third, which is external, he calleth the efficient cause; and at length the fourth, he nameth the end, to wit, unto which every thing is directed.

4 But this cause, in the minde of the efficient, he would have to be the first of the three former causes: and so natural things not onely to be principiated, or made to begin by the Being of Reason, and mental: but also, as if they were inanimate things, they did lie hid through the end, in the minde of the efficient cause. But if therefore he doth badly search into natural causes; he hath far worse appointed a supernatural end in the minde of the first mover, in the room of a natural cause, or he requireth a mentall conceit of the end in things without life.

5 Truly, I who have not been accustomed through the sloath of consenting, to serve others enterprizes, without foreweighing them, have very much found, that the three latter causes in natural knowledge, are false, yea and hurtful. But the first of the four, I will by and by shew to be fabulous. For first of all, since every cause, according to nature and succession of dayes, is before its thing caused. Surely, the form of the thing composed, cannot be the cause of the thing produced: but rather the last perfect act of generation, and the veriest essence and perfection it self of the thing generated: for the attaining whereof, all other things are directed. Therefore I meditate, the form to be rather as an effect, than as a cause of the thing.

6 Yea, more. For the Form, seeing it is the end of generation, is not meerly the act of generation: but of the thing generated, and rather a power that may be attained

ed in generation: but the matter, or subject of generation, as it is in act; so also its act, is an inward worker or Agent, the efficient, or Archeus or chief Workman. Therefore it is false, that by how much the more a thing hath of the form, by so much the more it hath of the act, of the Entity or Beingness of vertue and operation.

Because the form is not gotten or possessed by parts or degrees: neither therefore are Beings more or lesse capable to receive from the form: yea, although they were more capable to receive, yet the activeness of the Agent, is not of the form it self; but of the Master-workman, or Archeus, of whom by and by.

Therefore the form cannot be divided. For whatsoever *Aristotle* hath attributed to the form, or to the last perfection, in the Scene or Stage of things, that, properly, directly, and executively belongeth to that Agent, or seminal chief Workman. In the next place, seeing that the efficient cause of *Aristotle*, is external (as he saith the *Smith* to be, in his view of the Iron) I easily knew that he hath set to sale his fictions, for true foundations, and all his speculation, about artificial and external things of Nature, to wander. The whole efficient cause in Nature is after another manner, it is inward and essential.

And although the Father generating be effective: yet in order to causing, or doing, he is not but the cause efficient of the Seed, wholly outward, in respect to the Being which of the Seed is framed by generation. For in the Seed, which fulfills and contains the whole quiddity or thingliness of the immediate efficient, that is not the Father himself: but the *Archeus* or chief Workman. For that the Father in respect of the thing generated, hath the Reason of nought but an external cause, and occasionally producing: for by accident alone, the effect of generation doth follow, although, the Agent applies himself to generation with his whole intent. Therefore the constitutive constituter efficiently, causing inwardly, perfectly, and by it self, is the chief seminal Workman it self, really distinct from the Father, in Being, and properties. Even as in Vegetables. Herbs indeed are the productresses of Seeds, but they are but the occasional and remote causes of Herbs arising from that Seed; and therefore although they are natural causes, yet not sufficient and necessary ones: for neither of every Seed will therefore rise up a Plant. Therefore the seminal Being is in the Seed, the immediate efficient cause efficiently, the internal, as also essential, of the Herbe proceeding from thence. But the Plant that goeth before that Seed, is the remote cause, the natural occasion indeed of the Seed, which by it self, and immediately frameth the Plant, and effects it, with the assistance of that which stirs it up. For otherwise, if the Herbe causing, should be the efficient of the Herbe produced, the working or begetting cause could not be burnt up, but the Plant produced should also perish. Therefore the Seed is the efficient inward, immediate cause of the herbe produced. Wherefore after a diligent searching into all things, I have not found any dependance of a natural body, but onely on two causes, on the matter and the efficient, to wit, inward ones, whereto for the most part, some outward exciter or stirrer up is joyned.

Because that these two are abundantly sufficient to themselves, and to other things, and do contain the whole compofure, order, motion, birth, sealing notions, or tokens of knowing properties: and lastly, whatsoever is required to the constituting and propagating, or increasing of a thing. For the seminal efficient cause containeth the Types or Patterns of things to be done by it self, the figure, motions, houre, respects, inclinations, fitnesses, equalizings, proportions, alienation, defect, and whatsoever falls in under the succession of dayes, as well in the business of generation, as of government.

Lastly, Since the efficient containeth all ends in it self, as it were the instructions of things to be done by it self, therefore the finall external cause of the Schooles, which onely hath place in artificial things, is altogether vain in Nature. At leastwise, it is not to be considered in a distinct thingliness from the efficient it self. For that which in the minde of the Artificer is the Being of Reason: can never obtain the weight of a cause real and natural: Because in the efficient natural cause, its own knowledge of ends and dispositions, is infused naturally by God. Indeed all things in Nature, do desire some generating juyce, for their matter; and lastly, a seminal, efficient, disposing, directing principle, the inward one of generation. For of these two, and not more, have all corporeal things need of.

But the three principles of bodies, so greatly boasted of by *Paracelsus*, although they should be found in all things that are to be framed: yet it would not therefore follow,

follow, that those have the force of principiating, because those three, [seeing they are the fruits of Seeds, they do partake as it were, of a specifical diversity: which they should necessarily be ignorant of, if they should be true principles: that is, if they should be present before the framing of the particular kinde. Nor also could one thing passe into another, which notwithstanding, is a thing natural or proper to the three first principles of *Paracelsus*.

Moreover, since matter, and also the efficient cause do suffice to every thing produced, it followes, that every natural definition is not to be fetched from the general kinde, and difference, things for the most part unknown to mortal men: but from the conjoyning of both causes, because both together do finish the whole essence of the thing. And then, it also followes, that the thing it self produced, or the effect, is nothing but both causes joyned or knit together.

Which thing truly, is to be understood of things without life, to things having life, life is otherwise to be added over and above, or the Soul of the *Liver*. For so a Horse is the Son of his four-footed parents, created by virtue of the word into a living horse-like soul. Sublunary things are commonly divided into Elements, and things elementated: but I divide them into Elements and seminal things produced.

These again into Vegetables, Animals, and Minerals. So as every one of them may shut up a peculiar Monarchie, secrete from the other two. Therefore Minerals and Vegetables, if by any condition, they may seem to live, since they live onely by power, and not by a living form in light enlivened; they may also fitly be defined by their

matter alone, and internal efficient. For every effect is produced, either from the outward Agent, and it is a thing brought forth by Art: or from an outward awakener, and nourisher, which is the occasional and outward cause: which notwithstanding, hath an efficient and seminal cause within, and remains the efficient, even until the last period or finishing of the thing brought forth: yet the occasional cause is not the true, but mediate Agent.

But the subject which the Schooles have called the Patient or sufferer, I call the co-agent or co-worker. But in respect of both limits, or in the dispose of the working motion to the co-working, the action doth re-bound.

Therefore things that are produced without life, do not receive their forms, through the makeable disposition of the working terme or limit, but onely they do obtain the ends or maturities of their appointments and digestions. For while from the causes of Minerals or Mettalls, a stone doth re-bound, or from the Seed of a Plant, while a Plant is made: no new Being is made, which was not by way of power in the Seed; but it onely obtains the perfecting of the appointed ripeness. And therefore power is given to the Earth of producing Herbes: but not to the water of producing Fishes. Because it is not so in things that have a living Soul, as in Plants. For as their Monarchies are plainly unlike, so also their manners of generation and generating.

For therefore the natural gift of increasing Seeds, durable throughout Ages, is read to have been given to the Earth, not so in living Creatures: although these in the mean time, ought to propagate. Therefore the Seeds of things that are not soulified, are indeed propagated no otherwise than as light taken from light. Yet in the partaking of which enlightning, the Creator is of necessity the chief Efficient. But the Creator alone, createth every where a new light, (whether it be formal, or also vitall) of the individual that is brought forth: for neither was that light before, nor so much as in part, although from the potential dispose, or fit or inclinable disposition, the Seeds of things not soulified may in some sort be reckoned to obtain a Form; so are things that have life: yet the formal virtue is not so neerly planted in these, as in Plants. For Souls and lives, as they know not degrees, so also not parts. And although the Seed of a living Creature may have a disposition unto life; yet it hath not life, neither can it have it or effect it of it self, for the Reasons drawn from the

Rise or Birth of Forms. Wherefore I shall teach by and by, that there are not four Elements, nor that there is a uniting of the three remainders, yea nor of two, that bodies (which are believed to be mixt) may be thereby made; but that to the framing of these, two natural causes at least, do abundantly suffice: the matter indeed is the veriest substance it self of the effect: but the efficient, its inward and seminal Agent: and even as in living Creatures, I acknowledge two onely Sexes; so also are there two bodies at least, the beginnings of any things whatsoever, and not more, even as there are onely two great lights. For the three beginnings of bodies which the Chymists do call Salt, Sulphur and Mercury, or Salt, Liquor and Balsam, I will shew in their

their place: that they cannot obtain the Dignities of beginnings, which cannot be found in all things, and which themselves are originally sprung from the Element of water, and do fail, being dissolved again into water (as at sometime I shall make to appear) for it behoveth the nature of beginnings to be stable, if they ought to bear the name and property of a Principle.

Therefore there are two chief or first beginnings of Bodies, and corporeal Causes; 23
and no more, to wit, the Element of Water, or the beginning, [of which,] and the Ferment or Leaven, or seminal beginning, [by which] that is to be disposed of; whence straightway the Seed is produced in the matter: which (the Seed being gotten) is by that very thing made the life, or the middle matter of that Being, running thorow even into the finishing of the thing, or last matter.

But the Ferment is a formall created Being, which is neither a substance nor an accident, 24
but a neutrall thing framed from the beginning of the World in the places of its own Monarchie, in the manner of light, fire, the Magnall or sheath of the Air, Forms, &c. that it may prepare, stir up, and go before the Seeds. This is indeed a Ferment in general. But what things I here suppose, I will at length evidently shew every thing in its place. I will not treat of Fables, and things that are not in being: but of Principles, and Causes, in order to their ends, actions and generations: I consider Ferments existing truly and in act, and individually by their kinds distinct.

Therefore Ferments are gifts, and Roots stablished by the Creator the Lord, for the 25
finishing of Ages, sufficient, and durable, by continual increase, which of water, can stir up and make Seeds proper to themselves. Surely, wherein he hath given to the Earth the virtue of budding from it self, he hath given so many Ferments, as expectations of fruits: that also, without the Seed of the foregoing Plant, they may out of Water generate their own Liquors and Fruits. Therefore Ferments do bring forth their own Seeds, not others: that is, every ones according to their own Nature and property: which the Poet saith: *For Nature is subject to the Soil.* 26
Neither doth every Land bring forth all things. For there is in places a certain order divinely placed, a certain Reason and unchangeable Root, of producing some appointed effects, or fruits, nor indeed onely of Vegetables, but also of Minerals, and Insects, or creatures that retain their life in a divided portion. For the soils and properties of Lands do differ, and that by reason of some cause of the same birth and age with that Land. Indeed this I attribute to the formall Ferment created in that place: Whence consequently divers fruits do bud, and of their own accord break forth in divers places: whose Seeds being removed to another place, we see for the most part, to come forth more weakly, as counterfeit young.

But that which I have said of the Ferment or Leaven placed in the Earth, that very 27
thing thou shalt likewise finde in the Air and Water: for neither do they want Roots, Gifts, fermental Reasons or respects, which being stable, do bring forth fruits dedicated to places and Provinces, and that thing not onely the perseverance of fruits doth convince of: but also the voluntarily and abundant shedding abroad of unforsaken Seeds.

Therefore the Ferment holds the Nature of a true Principle, divers in this from the 28
efficient cause: that the efficient cause is considered as an immediate active Principle in the thing, which is the Seed, and as it were, the moving Principle to generation, or the constitutive beginning of the thing: but the Ferment, is often before the Seed, and doth generate this from it self.

And the Ferment is the original beginning of things, a Power placed in the Earth, 29
or places, but not in seminal things constituted. But the Ferment which growes up in the things constituted or framed, together with the properties of Seeds, hath it self in manner of the efficient cause unto the Seed of things: but the seminal Ferment, is not that which is one of the two original Principles; but the product of the same, and the effect of the individual Seed, and therefore frail, and perishing.

Whereas, otherwise, the principiating Ferment, laid up in the bosoms of the Elements, 30
continues unchangeable, and constant, nor subject to successive change, or death. Therefore it is a power implanted in places, by the Lord the Creator, and there placed, for ends ordained to himself in the succession of dayes. While as otherwise, the Seed in things, and its fermental or leavening force, is a thing, which the Scene of its Tragedy being out of date, doth end in an individual conclusion. For a thing, although it successively causeth off-spring from it self: that comes to passe not but

but by the virtue of the *Ferment* once drawn, which therefore ceaseth not in its own Places, unceasingly to send forth voluntary or more prosperous fruits, by the Seed of the former Parents. These things are easie to be known, in Mineralls sprung of their own accord: but in Plants, and living Creatures, generating by a successive fruitfulness of the Seed, it is not alike easie, as neither in things soulified, counterfetting indeed a confused Sex by putrifaction; but straightway causing off-spring also by a mutual joyning. But there is every where the same Reason of the *Ferment*, and so that the *Ferment* is on both sides the same Principle. For in the Seed, it is placed by the Parent, and undergoes an identity or sameliness with the same, or it is imprinted in the matter elsewhere, from external causes; and at leastwise, it on either side holds the place of a true inward efficient.

31 Because the framer of things, hath ordained proper and stable places for some *Ferments* in the Cup or bosome of the Elements, as it were the Store-house of the Seeds, therefore the first figures of efficient causes. But in other things, he hath dispersed them thorow individual things, and kindes, as if they were places: for elsewhere, he would have these beginnings stedfast, in regard of the Nature of bodies in which they are in: but in another place, that they might passe from hand to hand, into the continuances of things. But in this he would have them to differ, that the stable *Ferments* of places, should be as it were, the chief universal, simple, and inchoative or beginning Beginnings of Seeds, or the efficient of natural Causes: which indeed, should beget with Childe the Element of Water in it self, in the Air, or in the Earth. But that the sliding *Ferments* of frail Bodies, and those *Ferments* drawn from the Parents, should onely concern the matter prepared, and should fit immediately in the bosom of the Seeds: and therefore also that they should contain the inward necessity of death. Likewise the other universal beginning of Bodies which is the water, is the onely material cause of things, as the water hath the Nature of a beginning it self, in the manner, purity, simpleness, and progress of beginning, even as also in the bound of dissolution, unto which, all Bodies, through the reducing of the last matter, do return.

32 Which thing, I will straightway in its place typically demonstrate. A Beginning therefore differs from a cause, onely speculatively; as that is an actual initiating Being, and thus far causing. But a Cause may be a terme of relation to the thing caused, or the Effect, happily, neerer to a speculative Being. Or distinguish those as it listeth thee. I at leastwise understand, Causes to begin, and beginnings to cause, by the same name, whether it be in the bosom of the Elements, or in the very Family of material Seeds. Therefore in the History of Natural things, I consider the matter for the most part begotten with Childe by the Seed, running down from its first life, unto the last bound of that conjoynd thing; but not the first matter of *Aristotle*, or that impossible non-Being.

33 But I consider the reall beginnings of the efficient cause conceived, as the first Gifts, Roots, Treasures, and begetting *Ferments*. Or if the Reader had rather confound the efficient Cause with the *Ferment* of things, and the matter of Bodies, with the Element of water; I willingly cease to be distinct, onely that it be known how those things have themselves in the light of Nature. Thus at least I have discoursed of beginnings, and causes of Bodies, as I judge, and have found by experience; also I promise much light to those, who shall have once made this speculation their own.

34 Therefore first of all, they shall certainly finde the Maxime of *Aristotle* false: to wit, that the thing generating, cannot be a part of the thing generated. Seeing that the effective Principle of generation is alway the inward Agent, the inward doer or accomplisher, and the thing generating. Which appeareth clearly enough in those things, which bring forth living Creatures by their onely Mother, putrifaction. Wherein there is no outward univocall or simple thing generating: but the seminal lump it self, or the generative Seed, doth keep in it self all things which it hath need of for the managing of generation. But truly, neither is it sufficient to have shewen a couple of Causes: but rather it hath holpen more plainly to have brought forth the efficient, or chief Builder of the Fabrick.

35 Wherefore I do suppose in this place, what things I will demonstrate elsewhere, to wit, that in the whole order of natural things, nothing of new, doth arise, which may not take its beginning out of the Seed, and nothing to be made, which may not be made out of the necessity of the Seed. But the Tragedy that hath done its office in

in the bound of the end, is nothing but the period or conclusion of the Seeds, overcome with pains or ended: unless happily they may be compelled by violence to depart.

Wherefore I except the fire; because, as being given not for generation, but for destruction. Chiefly, because there is a peculiar; not a seminal beginning of it. Indeed it is a thing among all created things, singular, and unlike (as sometime in its place.) Last of all, I except the influences of the Heavens, which by reason of their most general appointment, have no seminal power in themselves. Because they are too far distinct from the lot or interest of things to be generated: and therefore influences are chosen to be for signes, times or seasons, dayes and years, by the Creator, nor ordained for any thing else: but not for the seminal causes of things.

Moreover of efficient and seminal Causes in Nature, some are efficiently effecting, but others effectively effecting. Indeed of the former order, are the Seeds themselves, and the Spirits the dispensers of these: and those causes are of the race of essences, through their much activity, worthily divided from the material cause. But the effective efficient, are the very places of entertainment, and the nearest Organs or Instruments of the Seeds: such as are external *Ferments*, the disposers of the matter into the interchangeableness of the passing over of one thing into another. Also hither have the dispositive powers of circumstances regard, likewise the cherishing, exciting, and promoting ones: because the Seed being given, yet not any things promiscuously do thence proceed.

Besides, our young beginner shall learn, the wit of *Aristotle*, ready in founding Maxims, that as oft as he found any thing agreeable to his own conceits, he would presently draw it into Rules, under an universal head, by binding or tying up the Roots of weaker authority that were taken from one to another. Which Maxims indeed of his, the following age wondered at, to wit, being prone to sloath, and therefore easily worshipping him, and those Maxims. Also oftentimes he brought learning by demonstration into Nature, by a forced Interpretation, as that he would have natural causes wholly to obey numbers, lines, and letters of the Alphabet, by a rashness altogether ridiculous. By way of example: he taking notice, that fire did sooner burn about dry Wood than moyst, he thereupon straightway meditating on a general Maxim, would, That the act of active things, should onely be on a matter disposed: which thing notwithstanding is enclosed with many ignorances.

For first, as soon as he saw the fire, an external Agent, to agree with combustible matter: he shewed hence also, that every other Agent in Nature, ought to act by the meanes of fire; not knowing the fire not to act by meanes of a seminal Agent, and to be a peculiar Creature. Therefore with the like ignorance, he judged every efficient cause, like the fire, to be of necessity, external. He was also deceived in this, that he determined every natural Agent to require a disposed matter: when as otherwise, the Agent in Nature doth dispose of the matter that is subject unto it. For neither doth any counsel of a natural Agent act for any other end, than that it may dispose the matter subjected to it, unto aims known to it self, at least, appointed for generation. Indeed out of one onely juyce of Earth, and one onely Garden, four hundred Plants do grow and fructifie. For if the Agent doth finde a friendly disposition in the matter, tis well indeed: but if not, he easily prepares the same for himself. What if hereafter I shall plainly shew, that all tangible bodies do immediately proceed out of the one onely Element of Water: by what necessity I pray you, shall the Agent require a fore-existing disposition of the matter: or if the disposed matter do fore-exist, who shall be that disposer, or fore-runner of the Agent? By it self sufficient to the disposing of every matter, wherein it is? But if thou sayest, the Ferment. At leastwise, thou oughtest again to have known, that both causes differ not in Nature from the thing produced, unless in ripeness; nor is the Agent to be distinguished from the Ferment. The which, if the Schooles, seasoned with the Discipline of a better juyce, did know, they would also know *Aristotle* to have revolted from his own Rules, which being at first true, he erected into the premises of Scientifical demonstrations. He had even become mad about the wondrous generatings of stones in us. And although, before the Elements of *Euclide* sprang up, he was more ignorant of the Mathematics: yet *Aristotle* being far more skilful in this, than in Nature, endeavoured to subdue Nature under the Rules of that Science. For he knew the Circle to be the most capable of figures in a plain. Therefore he suddenly forced it into a general Maxim, that also Ulcers, and wounds that are round, were more hard to be cured, than any others that were alike in extension. But truly, a piercing wound by a broad
Dagger,

Dagger is more difficult, than a round one in the flesh. But in Ulcers, the Fistula of the fundament, or weeping Fistula, are more laboursome in healing, than any Ulcer of the shanks or leggs, extended into a Circuite. Indeed he thought, being deceived with the aptness of Rules, the incarnating of a wound to promote it self onely by an external working Plaister, and that outsideness, not onely to be in relation to the superficies of our Body: but in a figural respect of the distance of the lips of the wound, in order to its Centre. I will relate a Story. A Trooper infects his Wife with the Pox or foule Disease: but this through extream want of a remedy, enlarged it self into an eating sore or Ulcer. One at least I saw wasting the fleshy membrane or coate, from the Ear into the neck, shoulder and elbow, behinde thorow the shoulder blades, the whole side of the ribs, and breast. Which membrane, as it is fatter in Women, so it contains a deeper depth. She said she had many other and lesse sores, thorow the bottom of the belly into the legs, and she shewed a humane body, almost without a skin. The Woman was carried by my authority, into the Hospital of *Vilvord*, the Nuns refusing: but might prevailing, also sometimes for a while commands the Nuns. The chief Chyrurgion, Tow being steeped in *Aqua fortis*, with incredible pain toucheth the quick muscles, and smites the house with a miserable howling. But passing by, I asked why he had done that. He saith, it is an ulcerated Cancer, and wholly so, and by how much the sooner she died, by so much the happier she would be. The complaining Nun hearing that, said, she was not bound by the rules of her house, to entertain the Cancer, Leprosie, or Pox, &c. Forthwith therefore before the twilight, they bring forth the Woman to the Suburbs, and laid her on the Dunghill. But a poor Country man, pitying the unknown Woman, makes her a little Cottage of boughes, against the Rain, but he applieth some Colewort leaves to the abounding or running filthy matter, and to drive away the unkindeness of the Air. He tells the chance to me, I gives her the *Corallate* of *Paracelsus*, prepared by the white of an Egge, and in twenty six dayes she was wholly well. For the great Ulcers, with a hastened force, were covered with skin, some exceeding small chaps, from the beginning, keeping a longer continuance. A little after, a certain Kinsman dying, bequeaths to this most poor Woman, a House and Land. Her Husband perished behinde the hedges: She marries the second time, being now rich in a Herde, a flock, and in Lands. For I having admired in her Husband and the Chyrurgion, robbers or murderers: in the Monks, lightness; in the Countryman, the *Samaritane*, and in the Woman, *Job*, I knew the God of *Job* to be the same, and the continual almighty Ruler of the Universe. From whom, although man hath privily stolen the Titles of Majesty, Highness, Excellency, Clemency, and Lordliness, he hath reserved at least one onely perpetual one to himself, which is that of Eternity. In respect whereof, man is a Mushrome of one night, on the morrow rotten.

- Therefore let the Schooles know, that the Rules of the Mathematicks, or Learning by demonstration, do ill square to Nature. For man doth not measure Nature; but she him. For neither shall a Heathen man that is ignorant of the wayes, shew more the wayes, than a blinde man, colours not seen before. Therefore, besides the ignorance of Nature in its Root, and thingliness, or what it is; the Schooles have not known the causes, number, requirance of things. Lastly, the Fluxes of ripenesses, slownesses, and swiftesses. And likewise they have not known, the composures, and resolvings of Bodies, made as well by Nature as Art. Likewise the necessities, ends or bounds, dispositions, defects, restorings, deaths, consequences of Seeds, also of Ferments, also their nearnesses and dependencies, for that they diligently taught the natural Agent to be a forreiner and a stranger to things. Also by way of consequence, they have been ignorant of the births of forms, as also of the properties proceeding from thence.
- 41 In whose place they have exposed fortune, chance, time, a *vacuum* or emptiness, &c. that which is infinite, although they are all strangers to Nature, and those things which did contain ridiculous Disciplines. Yea, they have followed the Authour, who believed the World to be extended from Eternity unto Eternity, by its own proper forces or virtue, and he contradicted himself, by denying an infinite. Since the first moreover, being to abide for ever, to make all things in his eternal power, doth necessarily include an infinite.
- 42

CHAP. V.

The Chief or Master-Workman.

1. *The Archeus or chief Workman is the efficient cause.* 2. *How it is in Seeds.* 3. *The properties and differences of the same.* 4. *The Composition of the natural Air.* 5. *The Birth of seminal Idea's or shapes.* 6. *The seminal Garment of the chief Workman.* 7. *The places of Hospitality, with Curers, appointed for the Seed.* 8. *The Conjunction of the Stars imitated in Seeds.* 9. *The first mover hath not the Vicarship in a man.*

I Have touched at the birth and Causes of Natural things, and least I may seem to have placed the efficient Cause, undeservedly within, I will the more fitly explain the Workman, the Vulcan or Smith of generations.

Whatsoever therefore cometh into the World by Nature, it must needs have the Beginning of its motions, the stirrer up, and inward director of generation. Therefore all things however hard and thick they are, yet before that their soundness, they inclose in themselves an Air, which before generation, representeth the inward future generation to the Seed, in this respect fruitful, and accompanies the thing generated, even to the end of the Stage.

Which air, although in some things it be more plentiful: yet in Vegetables it is pressed together in the shew of a juyce; as also in Metals it is thickened with a most thick homogeneity or sameliness of kinde: notwithstanding, this gift hath happened to all things, which is called the *Archeus*, or chief Workman, containing the fruitfulness of generations and Seeds, as it were the internal efficient cause. I say, that Workman hath the likeness of the thing generated, unto the beginning whereof, he compositeth the appointments of things to be done.

But the chief Workman consists of the conjoyning of the vitall air, as of the matter, with the seminal likeness, which is the more inward spiritual kernel, containing the fruitfulness of the Seed; but the visible Seed is onely the husk of this. This Image of the Matter-Workman, issuing out of the first shape or Idea of its predecessour, or snatching the same to it self; out of the cup or bosom of outward things, is not a certain dead Image: but made famous by a full knowledge, and adorned with necessary powers of things to be done in its appointment; and so it is the first or chief Instrument of life and feeling. For example. For a Woman with Child, fashioneth a Cherry in her Young; by her desire, in that part, in which she moveth her hand in desiring.

A Cherry, I say in the flesh, true, green, pale, yellow, and red; according to the stations, in which the Trees do promote their Cherries. And the same Cherry sooner waxeth red in the same Young, in *Spain*, than in the Low-Countries. Therefore a Cherry is made by Imagination: So through the Imagination of lust, a vitall Image of living Creatures is brought over into the Spirit of the Seed; being about to unfold it self by the course of generation.

But since every corporeal act is limited into a Body; hence it comes to passe, that the *Archeus*, the Workman and Governour of generation, doth cloath himself presently with a bodily cloathing: For in things foulified, he walketh thorow all the Dens and retiring places of his Seed; and begins to transform the matter, according to the perfect act of his own Image. For here he placeth the heart, but there he appoints the brain; and he every where limiteth an unmoveable chief dweller; out of his whole Monarchy, according to the bounds of requirance, of the parts; and of appointments.

At length, that President, remains the overseer, and inward ruler of his bounds, even until death. But the other floating about, being assigned to no member, keeps the oversight over the particular Pilots of the members, being clear, and never at rest or keeping holyday.

Moreover, as sublunary things, do express in themselves an Analogy or proportion of things above: So every thing, by how much the more lively it is, by so much the more perfectly it imitates the Stars, so that sick persons do seem to carry in themselves sensible *Ephemerides*, or daily *Registers*, being skilful of future seasons. Indeed in the bowels, the planetary Spirits do most shine forth, even as also, in the whole influous *Archeus*, the courses and forces of the Firmament do appear.

- 9 But the first mover, hath no where had a member in men: but onely under the *Archeus* of the wombe, it meets by meditating by way of similitude, as it were in the last finishing of created things. For happily a Woman is therefore more stirred, or troubled in her first Conceptions, as she drawes with her, other Orbs, by her first motions. As often as the wombe being swollen, with the ascending Rule of Imagination, doth suffer an animosity, or angry heat, it snatcheth the particular *Archeusses* of the bowels into the obedience of it self, by striving to excel manly weakneses, and for the most part, wretchedly deludes Physitians with a feigned Image. The *Archeusses* of bruit Beasts, are almost like unto mans. Neither shall we draw an unprofitable knowledge of the shop of simples, from the difference of Plants, and their Sexes. Because neither is it without a Mystery, that in creeping things and insects being born in corruption alone, Nature invariably sporting her self, intends nothing so seriously, as the proportionable differences of Sexes on both sides. Wherefore, neither must we think the same things to have been neglected in Plants, although they may make one onely Seed blessed with a promiscuous Sex, and a most fruitful of-spring. But the most able effectress of the greater forces, is discerned under the Signatures or Impressions of *Venus*: she being very bright, there is a care of the Sexes, and now and then a hermaphroditical confused mixture. For whatsoever Plants are femalls, they do allure or procure the violent motion of the first mover. Therefore the Natural Astrologic of the humane Seed, frames its directions according to the general motion of the Heaven, but it doth not beg it abroad: for if every Vegetable could send forth its seed, before the Creation of the Stars, surely it became man to rejoyce in no lesse priviledge: to wit, to have his subsistence, moving, and his bearing from above, from the inbred Seed, but not from the Stars; in the book of long life, those things are at large cleared up, which are here desired, concerning the *Archeus* or Master Workman of life.

CHAP.

CHAP. VI.

Logick is unprofitable.

1. The Authours Protestation. 2. The Omen or Presage of this Book.
3. What meanes he used in the composing of Philosophy. 4. The Authour writes, as it were from a command. 5. The distribution of Logick, by its parts. 6. The ridiculous penurie of differences for a definition. 7. The misery of division. 8. The method of dividing, deserves not the name of Philosophy. 9. The vain boasting of discourse. 10. Logick brings forth onely an opinion. 11. Why nineteen Syllogismes do not bring forth knowledge. 12. The boasting Syllogistical Pomp is examined. 13. Why every conclusion is annexed to a doubt. 14. Why the conclusion of Syllogismes is not of necessity. 15. In true Premises, false conclusions, and on the contrary. 16. That the knowledge of demonstration is not to be generated in a Learner. 17. Why a Syllogisme doth not bring forth knowledge. 18. True Sciences cannot be demonstrated. 19. The knowledge of Principles is not in reason. 20. What may be found out by Logick. 21. The Schooles of Logick oppose themselves to the holy Scriptures. 22. By Logick is onely re-taken, what was before known. 23. A double, and almost an unprofitable end of Logick. 24. No knowledge but it is from above. 25. To sell Logick for Philosophy, contains a juggle or deceit.

I Shall be called a presumptuous brawler, it displeaseth any of those that went before me, to understand, like the Boar, that utterly destroyes the Vineyard. But I know that it would go ill with me, if my Soul should stand subjected to the judgements of men. For I began from my Manhood, to look a squint upon ambition, or that vaineſt of things, depending on the unstable will or judgement of men.

My Eye alwayes directly beheld the calling, which (my Mother being against it) I had made mine. But now I know, that I am compelled to teach the truth, & therefore the doctrine of this Book, although it self shall cease with the number of dayes, yet that, that shall remain even to the end of the World. What if I shall shew the ignorance, sluggishness, impieties, and cruelties of Physitians, about things that are to be had in the greatest esteem, and whose losse is irreparable, and lastly, most dangerous to Souls, and it shall be answered me with despight, scoffing, and taunting: truly from this very time, I rejoyce in my self, and am contented with the living hope of that recompence. For it was needful, that in the composing of new Philosophy, I should break down almost all things that have been delivered by those that went before, and many things ought to be set in good order, and restored, which every one will not receive with a like acceptance. Neither am I ignorant that it is alway the lot of those that deserve well, to undergoe the sharp, and for the most part, ignorant censurer. But if I teach things that are profitable, it is a Command, not to bury ones Talent received in the Earth. I might say with Jerome, in his Prologue of Isaiah, *Let them read first, and afterwards despise, least they seem to condemn things unknown, not from judgement, but from the presumption of hatred.* But I nothing esteem, whether I shall be read, and reprov'd, or not.

It is enough, that I have sufficiently yielded to the command. For neither was there any animosity or heat of ambition in me, of being made known, who willingly do confess, that I have no good thing that is to be imitated. Yea the Book had been put to the Press without a name, if it could have been done without offence. I began from my youth, to accustom my self to practise upon the Itch, Physitians, Chyrurgeons, and Apothecaries speaking against me, that the rest of the common people, might despise me as an Alchymist and a Philosophie, a few onely favouring me, and from whose favour I have hitherto withdrawn my self what I could. Surely I have spent much time and labour;

labour, and have withdrawn much more profitable leasure from my self, that I might satisfie the command of this study. Let the praise be to the first truth, to which alone belongs the recompence of well doers. In whose glasse I have seen, and held it confirmed, that the judgements of men do for the most part directly differ from the judgements of God: That the common applause is foolish, full of Errours, infamous, and alwayes hurtful: but that the Universal Judge, knowes no Errour.

- 5 Therefore I will begin with things pertaining to discourse. Logick consisteth of three parts, of definition, division, and discussing by Argument. First of all, they teach that a definition consists in the Genus or general kinde, and in the constitutive
6 difference of the thing defined. But seeing that scarce any other constitutive difference of the Species or particular kinde is known, besides rational, and irrational, which is a specifical difference, and neere to individuals, and that one of these two is hitherto Negative: truly, the first of these, I shall sometime prove to be frivolous: wherefore one foot being taken away from that which hath three feet, the *Logitian*
7 must needs fall, that hath trusted in such a seat. Especially, because division also is so miserable a member of Logick, that it may be deservedly doubted, whether through a ridiculous barrenness, it hath remained almost neglected by the Schooles themselves. For the former is as well the knowledge of the whole and entire thing, as of its parts. And as concerning Essence, it belongs to an universal one, to be one in many, and therefore it is more knowable. For he that hath known one thing, and that which is profitable, he hath known more things, and particular things: but not on the contrary. Because one thing, and profitable, is in the understanding; but plurality, or dividing, is in the sense. For by how much the more any thing is divided into parts, by so much the more it approacheth to things infinite, and therefore it is the lesse to be known, sliding unto irregularity, and the more subject to change and opposition. But since Logick treateth of Universals, and that it may be said. 1. Of the latter: *that we erre less in Universals than in particulars*: Surely, Logick leading us by division unto singulars, it is so far from leading to the knowledge of those things, according to *Aristotle*, that it rather thrusteth us down into errors.

- 8 Truly if we more fully consider of the member of division, it is able to perfect no part of Philosophy, it is a certain naked method of dividing, so rude and raw, that scarce one supposition, maxim, property, mood, and progress thereof, can be taught or dictated to young men.

Therefore Logick being barren, and deprived of two feet of the three, was long since ruinous with me. For Philosophy is penurious, and worthy of pitty, which Boasteth, that with such scanty Household-stuffe, also with all necessities so small, it is the begetter of Sciences.

- 9 But the third member of Logick, being lifted on high, is accounted to be of great weight with discursary men: although in the true uses of Nature, it is alike inconvenient. Because Nature is that which hateth brawlings, neither doth it willingly bear discords: Indeed the World hath suffered it self to be circumvented by *Aristotle*, because he boasteth of Logick to be the Mother of Sciences, nor that we do know otherwise than by demonstration. And least Idiots should laugh at this boasting of the Boaster (most of whom are more crafty and skilful than Logicians, and have known more things) he hath made Logick as it were native, and proper to us by nature. Therefore he finely extolleth the method of disputing invented by himself, with many prayes, and he takes away all knowledge from man, as being a plained Table, unless he hath yielded himself to be instructed in Logick. Truly, I do even admire at this vanity, and the credulities of the World: especially for that he hath been compelled to grant discourse, or natural Logick to men, by a native endowment. And so he esteemeth his own Philosophy, his finder out of all Sciences, no more a certain hidden Science, but a certain natural strife of scolding in words, and a method composed to this end. Therefore in this place, we must enquire, how much of truth, power, and profit it may have.

- 10 As to that which concerns my self, I know, that every dispute doth at length, bring forth a conclusion; but that every conclusion, brings in onely an opinion. Yea, that the most strong reasoning (they call it a Syllogisme) never afforded any knowledge at all, or is fit to give it. Wherefore knowledge shall be lesse to be expected from any other small form of argument whatsoever.

Among

Among 19 forms of Syllogismes, 12 do conclude negatively: But no negation ever brought forth knowledge, seeing it containeth something privatively; and teacheth that to be nothing which it denyeth to be any thing. But knowledge must needs be positive, because it is onely of a positive, and from a positive thing.

Lastly, since the foundation of every Syllogisme is placed in that, that if two things agree together, the same things ought to agree in some third thing, the conformity of whose agreement, ought to appear in the conclusion it self: therefore the knowing of that conformity doth necessarily fore-exist in us before the conclusion: so that I have altogether foreknown that in the general which is demonstrated by the conclusion. For that lies hid in us, as it were fire under the ashes: and shewes it self openly, through the natural power of discourse, as often as it shall come in use, no less than by the Rules of Logick: which thing *Aristotle* himself dared not to deny. For otherwise, he which thus should seek knowledge by Logick, hath after some sort, and in some measure known, what he seeketh. For if he had not known that, and could not know it; how should he know it when he had found it? unless *Logicians* had rather to have knowledge that is sought for by demonstrations, to be found by chance.

To sum up all, the knowledge which we have by demonstration, was already before in us, and onely is made a little more distinct by a Syllogisme: but yet it remains as before, joyned with doubting: Because every conclusion doth necessarily follow the weaker part of the premises: hence it comes to passe, that it is composed with a doubt of the contrary. Yea, the conclusion of a Syllogisme for the most part, may deny particularly, whose premise was a universal Negative, nor dares it to infer any thing affirmatively, where there is any thing of a Negative in the premises. As a sign, that it teacheth nothing by way of affirming, but doth most willingly deny. Moreover, since knowledge lies hid under the ashes, in the intellect or understanding, this is able as often as it seemeth needful for it self, to shake off the ashes, neither hath it need of Moods and Syllogistical forms, to this end. Yea seeing, that according to *Aristotle*, we are not to dispute, but with those that do admit of principles, and those which he thinketh to be chiefly true; it comes to passe, that from unlike principles, a strange conclusion may often follow, to wit, from false premises. Nothing that is to be worshipped is the Creator; and every Image is to be worshipped: this true conclusion followes: therefore no Image is the Creator. Therefore it cannot be thought that the conclusion of Syllogismes doth constrain of necessity. For otherwise, from a lie doth necessarily follow that which is false, in true understanding, and true knowledge. From an impossible thing, followes that which is impossible, and from an absurd thing, nothing but that which is absurd: Which thing, all learning by demonstration proveth. Therefore even as in a lie, truth and the knowledge thereof, is not contained, or doth lie hidden: So it followes, that in the premises, the knowing of the conclusion is not necessarily included. For either it is false, that no lying Tree, doth make the good fruit of truth: or it is false, that of false premises, as of principles, a true conclusion may arise. Yea seeing it appeares from thence, that there is not a necessary dependance of the conclusion on the premises: it is also easily understood, why the Soul hath hitherto made such a scanty progress by demonstration.

Wherefore *B. Augustine* saith, *Even as in false Sciences there may be true conclusions, so in true Sciences there may be false ones.* Moreover, where I have more narrowly weighed the nature of demonstrations, I have found demonstration, and the knowledge thereof, to be in the teacher, but not in the learner: and so not so much to finde out knowledge, as to boast of it, being already found out. But in a learner, a Syllogisme, blowes of the ashes from the fire: because whosoever makes a Syllogisme, he already before distinctly knew that which he endeavours to have granted him by the conclusion. To wit, he knew the termes, the mean, and the Mood: For neither doth any one make a Syllogisme, with unknown termes. Therefore demonstration hath seemed to me, to serve School-masters that stir up their young beginners to attend those things which they themselves know. Who certainly, have hitherto found out few and profitable Sciences, however they may boast, that by demonstrations, they do seek after the meanes, and do attain Sciences. For every Syllogisme, hath first conceived an opinion of the thing, and perswades, that that opinion is sure to it self: the which, that it may afterwards confirm, for it self, or for those that learn, it seeketh termes, a mean, and a Mood, that it may force its demonstration into a form. Therefore

fore a Syllogisme is not to finde out Sciences, but rather, that it may demonstrate to others, opinions found out. And seeing that a Syllogisme doth cause a certain remembrance of that in the learner, which he knoweth, and no other thing: but Sciences are not gotten by remembrance; as if all knowledges of all things, had fore-existed in us: Hence, a Syllogisme cannot bring forth, or finde out Sciences, which onely maketh knowledges found out, and known, more clear. But I know, and confesse, that the knowledge of my understanding doth dwell immediately, in understanding, and since (according to *Aristotle*) those immediate knowledges (that is intellectual ones) are not to be demonstrated: it also followes, that every kinde of true, or intellectual knowledge, is not to be demonstrated: that is, true Sciences cannot proceed from demonstration. For every demonstration consisteth in Discourse and Reason; indeed it is a simple and perfect reasoning.

But according to *Aristotle*, the knowledge of principles is not in reason: but altogether above it. Therefore to know by a Syllogisme, cannot be an intellectual, essential, as neither a principiative thing, or from a former cause; but only from suppositions of predicaments and Rules being placed; there is derived a supposed opinion of the Syllogizer (I have written more and sufficient things concerning this matter, elsewhere.) Therefore blessed *Jerome* doth not unworthily compare the art of making Syllogismes to the Plagues of *Egypt*: and he calls Logical demonstrations, dog-like discourses. But the Apostle would have them to be wholly avoided; doing nothing through contention, and so striving with words, profitable for nothing, but to the subversion of the hearers. Because they are that which do quench Faith, and the rewards of Faith.

But they say, Logick is the finder out of the meanes: to wit, it is for the finding out of the meanes, and form for demonstration. Dost thou think, that perhaps the Apostle was ignorant, what and how much Logick could profit? that he speaks without, besides, and against the Spirit of truth, when he commands Logick to be avoided? or is more to be attributed to such feeble discourse, than to the Apostles Command? But truly, Logick doth not finde out the meanes of being, having, doing or knowing: but onely of a more brief shewing some kinde of thought or opinion: and so it invents composed brawlings, even to oppose the truth. For therefore doth the Apostle call Logick (by a Title despised enough) contentions. Which surely he had not done, if it were the Mother of Sciences, the finder out of profitable meanes, or if it were profitable to Christians. Therefore the Schooles teaching and doing otherwise, supposing Logick as necessary, and daily much using it, do oppose themselves to the Command of the Apostle.

Therefore invention in Logick is not properly invention, as neither is demonstrable Science a true and intellectual one. Because we do not properly finde out those things which we do any manner of way know, as we do not finde out, what things we already have in the hand, or in the Chest; but things not known before, are properly invented or found out, even as also things not had, nor possessed, are gotten by invention or gift. For when any one sheweth me *lapis Calaminarius*, the preparing of *Cadmia* or *Brasse Ore*, the content of, or what is contained in *Copper*, the mixture and uses of *Aurichalcum*, or *Copper and Gold*, which things I knew not before, he teacheth, demonstrateth, and gives the knowledge of that, which before there was ignorance of.

But such like things Logick never taught. Therefore Logical invention is a meer re-taking of that which was known before. And therefore what is not known, Logick knowes not. For our Spirit was already before in the possession of that, which they promise is to be found illustrious by Logick. Because it is impossible to know whether the premises are true, appearing, or false, unless the knowledge of the termes shall be in us first, with all knowledge of their matching, or suiting & confirming. Therefore the whole service, office, and profit of Logick, consisteth onely in two things: to wit, that the teacher may be able distinctly to imprint his opinion in the hearer; and that the hearer, may stir up his memory or remembrance, through the conjoyning, fitting or squaring, matching and suitableness of the termes. Which thing indeed, is not the inventive office of Sciences: but a certain following order of discourse, to that which was found out. Lastly, neither doth any thing so made, any way have respect to Sciences: but onely to words.

But Wisdom, the Son of the everlasting Father of Lights, onely gives Sciences or knowledges. But the meanes of obtaining Sciences, are onely to pray, seek, and knock. In the mean time, I wonder at the so great blindness of the Schooles on every side,

On Psal.
140. 8c
143.

side, in so greatly extolling and magnifying *Logick*. Truly I could desire to know: let the School tell me, what Science *Logick* hath ever brought forth to light? whether happily Geometry? Musick? making of Glasse? Printing? Husbandry? Medicine? drawing or conducting of Water? of Minerals? of Warfing? of Arithmetique? of Building? or any profitable Science? verily none. Therefore at length, with blushing, must the Schooles of *Logick* confess, that the same thing hath befallen *Logick*, which hath hitherto, the Doctrine of *Galen*. To wit, that through boasting, deceits, and ignorances, it hath deceived the credulous World. But the Heathens, in setting demonstrations, and Sciences to sale; have had no other light, than what hath flowed from corrupted nature, seduced by dark opinions, into disorder, and inordinatenesses, slavishly obeying the changes of circumstances, and opinions springing from thence. These things therefore have I communicated to learned men, who at length have confessed, that *Logick* was given to be drunk by young men, at that age, wherein they could not bear any other more sound meat, and that it served them for the sharpening of their wit. (I would God that *Logick* did not serve for divers abuses, and that being once drawn in in youth, it did not afford a plentiful age of pernicious wits, and of Logical deceits.) To which I add. That deceit is not wanting, if they may in the mean time, commend *Logick* for true Philosophy, for the finder out of Sciences. They say, but Logical Discourse is at leastwise, very necessary for Divines, whereby they may refute the subtleties of Heresie. That thing I have judged would be to be wise above the Apostle, and so to commend the abuses of the Schooles above the holy Scriptures. For Gospel truth, desires not *Logick*, or contentings: but it requires godliness of life, in Faith, an example of living, an uncorrupted conversation, abstinence from inordinate desires, and pride of life, that the Word of God may be made fruitful. It hath been sufficiently disputed by enlightened Teachers, from the beginning of the Church; many testify with me.

CHAP. VII.

The ignorant Natural Philosophy of *Aristotle* and *Galen*.

1. *Aristotle* is altogether ignorant of Nature.
2. That thing is proved.
3. What Nature is, among Christians.
4. The same thing is again confirmed by thirteen other Reasons.
5. In Nature, there is the Agent, the matter, the disposing of instruments, and the effect, or thing produced.
6. That heat is not an agent in seminal generation.
7. Why *Aristotle* hath not known the truth of Nature.
8. His Books of natural Philosophy, contain onely trifles.
9. How young men are to be instructed in the place or room of Schoole-Philosophy.
10. Into what great Apolles young men might climbe.
11. The Prerogatives of the fire.
12. What a young man so instructed, might judge.
13. Privations do not succeed in the flowing of Seeds to generation.
14. There is no form of a dead Carcase.
15. That generation and corruption do not receive each other.
16. The Vulcan of life, vanisheth, without the corrupting of it self.
17. Death is not the corruption of life.
18. The distinction of privation and corruption.
19. Of forms there is no corruption.
20. The ignorance of *Galen*.
21. His ridiculous Volumes concerning the decrees of *Hipocrates* and *Plato*.
22. His books of preserving of health are foolish.

THE Schooles have so sworn constancy, and their end to their *Aristotle*, that even to this day, they (by putting one name for another) do call him [the Philosopher] whom notwithstanding, I certainly finde to be altogether ignorant of Nature, and it grieveth me not to write down some causes, which have enforced me hereunto, and that for no other end, than that hereafter, as well Professors, as young beginners, may not through an aptness to believe, and a custome of assenting, be made to wander

out of the way, nor may suffer themselves hence-forward, to be led by a blinde man into the ditch. For otherwise I tell no mans tale; nor am I more displeased with *Aristotle*, than with a (*non ens*) or [a non-being].

Therefore first of all, *Aristotle* defineth Nature. *It is the Principle, or beginning of motion, as also of rest in Bodies, in whom it is in, by it self, and not by accident.* Wherein I finde more errours and ignorances of the definer, than words. First therefore the word [it is in] sheweth that he speaketh of a Body really existing, but not of his impossible matter. 2. He denotes, that such Bodies, are not of the number, or supposed things of Nature. For truly it belongeth not to Bodies to be in Bodies by it self, and not by accident. 3. He takes away any accidents from the Catalogue of Nature, as if they were without, besides, and above Nature, because accidents are in by accident. 4. He sets down, that Bodies which have motion, or rest by accident, are likewise without Nature. 5. That the Being of things is in Nature, in Nature it self, before the day, or motion, or rest of the same. Because it must needs be, that something first be, before that it move, be moved, or doth rest. And so the Principle of Being, goes before the beginning of moving, or resting: notwithstanding, Nature cannot be, before its existence. For if the beginning of motion or rest, should be latter, or an effect as to their Being: Nature should be an effect, as to its being a natural thing. 6. What if God after Creation, had enjoined neither motion nor rest (rest indeed according to *Aristotle*, presupposeth the bound of motion) there had now been a Creature, and not Nature. For God, in the beginning, created the Heaven and the Earth. Now Nature was not understood by *Aristotle*, to wit, there was sometimes a Creature, and it actually existed, before, or on this side Nature, here defined. 7. Bodies, in which the beginning of motion is external, and by accident (suppose thou, when the heat of the Sun moves the Seed, to increase, or a Woman with Childe, by accident, transforms the imperfect Infant, by her own Imagination) should not be under Nature, as neither that accidental beginning. 8. To rest, is not, not to be moved, but to cease from motion, and so not to be moved is more general than rest. Therefore Nature absolutely taken, should be onely after the existence of Nature. 9. If the beginning of motion in a moveable thing, be Nature, and the efficient cause be properly called the beginning of motion, (as he saith heat not elementary to be) therefore it must needs be, that the efficient cause is inward (which is against *Aristotle*) or that Nature, in as much as it is the beginning of motion, is not in Bodies most neerly or inwardly by it self. 10. Every outward efficient cause, is the beginning of motion in a thing, by accident. But every efficient cause, according to *Aristotle*, is external: therefore no efficient cause external, is natural, which is contrary to his second Book of Physicks. 11. Whatsoever things are moved by the Mathematicks, and also a Mill moved by the Winde, or a stream, should not be moved by Nature.

But I believe, that *Nature is the Command of God, whereby a thing is that which it is, and doth that which it is commanded to do or act.* This is a Christian definition, taken out of the holy Scriptures. 12. But *Aristotle*, contrary to his own Precepts of a definition, takes the difference, which he thinketh to be constitutive, for the general kinde of the thing defined in Nature: to wit, the formall beginning of motion and rest. But for the constitutive difference, he takes the matter, or Body, wherein the said beginning of motion is. But Christians are held to believe, Nature to be every Creature, to wit, a Body, and accidents, no lesse, than the beginning of motion it self. 13. Death also, although it be the beginning, by it self, of rest in a dead Carcase, yet Christians do believe it not to be created by the Lord, and so neither to be Nature: and although it may light naturally on it, yet that happens not by reason of the death, but of its natural Causes.

But *Aristotle* in another place, alike stumblingly touching on Nature, saith: Every power of the Soul seemeth to be a partaker of some other certain Body (for neither dares he positively and simply to affirm it) than those which are called Elements. For even as Souls do differ, so also the Nature of that Body doth differ: the Seed contains the cause of fruitfulness, to wit, heat: which is not fiery, but a spirit or breath in the froathy body of the Seed, and the Nature which is in that Spirit, answereth in proportion to the Element of the Stars. This Precept, praised by the Schooles, containeth almost as many Errours as Syllables. And at length, this Writer of natural instruction, being exceeding doubtful, knowes not, what he may call or ought to call Nature. For first he saith it to be, a Corporeal power of the Soul, and therefore he banisheth the understanding out of the powers of the Soul. 2. He saith, the power of

of the Soul which he afterwards calleth heat, is a partaker of another Body than those that are called Elements. As if it were a partaker onely of a Body above an Elementated one, and heavenly. 3. It is absolutely false, and an ignorant thing, that any power of the Soul is a partaker of the body, although it be tied to the body. For every power is an accident; and no accident, or quality can be a partaker of a Body: but on the contrary, a Body is a partaker of accidents. 4. That souls do not differ, but in respect of that body (which at length he calleth meer heat) notwithstanding that all Souls are a power, partaking of a heavenly Body: therefore Souls do not differ in respect of that Body, in which he hath said, they all do agree: or if there be any difference between Souls, let it be in respect of the matter of a Body, or of an unnamed Client or retainer, being neglected by, and plainly unknown to Aristotle. And so, in so great a dress of words, he hath spoken nothing but trifles. 5. If Souls do differ onely for that bodies sake: the act shall be now limited by the power, the Species or particular kinde, by the matter, not by the form. 6. The Seed contains the cause of fruitfulness; it is a Childish and trifflous thing: because the Seed ceaseth to be Seed, if it be without the cause of fruitfulness. 7. Every power of the Soul, is a partaker of some other body, than those which are called the Elements. Yet he would have the bodies of all soulified, or living Creatures, to be of necessity mixt, of none but actual Elements. 8. The Seed is not fruitful, but by heat. As though Fishes were not more fruitfull than four footed Beasts; and as though Fishes were not actually cold. 9. He knew not another moderate heat, from live Coals, which nourisheth Eggs, even unto a Chick. And he knowes not that all heat is in one onely most special kinde of quality, being distinguished, onely by degree. 10. He is ignorant, that heat, onely makes hot by it self, and that it should make fruitful by accident. And therefore, although that heat be the principle of motion, and the power of the Soul (that is, Nature) by it self; yet as it should make the Seeds fruitful by accident, it should be the beginning of motion by accident. Therefore in respect of the same Nature, it should be a beginning by it self, and by accident, or with relation to the same Nature, it should be Nature, and not Nature. 11. He confoundeth the quality of heats, with the spirit, and air of the froathy Seed, which notwithstanding, do differ no lesse than in predicaments. 12. Heat is the spirit of the froathy body, and the nature which is in that spirit, is heat. Therefore the spirit shall be in the spirit. 13. Nature is in that spirit, and that spirit is not the nature defined by Aristotle for the subject of natural Philosophy (yet that spirit is the Principle of motion in the Seed, and of life, in living Creatures) and he much more strictly denies, the froathy body of the Seed, to be of the account of nature (as though the seed of things were a froath, and not the more inward invisible kernel, in a corporeal seed) but that onely the power of Souls (which with him, is nothing but heat) were nature. 14. Because every power of the Soul is encompassed with heat, he excludes out of the account of nature, any other bodies and accidents. 15. That power of Souls, for whose sake, Souls do differ, is onely heat, not indeed a fiery one, but agreeing in proportion with the Element of the Stars, that is, it hath not been understood by Aristotle, nor is it to be any way to be understood by the Schooles, how heat doth agree with a body, & with an Element: what agreement there can be, between such various dependants of predicaments. 16. He denieth this power of Souls, to be of the race of Elements. That plural number, rejecteth not onely one Element: but by reason of the strength of negatives, all Elements. 17. Every power of the Soul is, a meer heat, not indeed answering to the heat of the Element of the Stars, but altogether to the Element it self. 18. For truly he acknowledgeth no other heat, than that of fire: nor any other Element of fire, than that which is of the kitchin, (because he distinguisheth Elementary heat, from the Element of the Stars) yet by his own authority, he hath inclosed fire that is not of the kitchin, between the Heaven and the Air. 19. At length, as oft as he was positively to tell what nature was, the privy shifter saith, sometimes that it is the power of the Soul, sometimes the fruitfulness of the Seed: and at last, he neither perceived, nor ever knew, what the heat not fiery was, and makes a fifth Element of the Firmament of the Stars, after he hath cast away the other four, by denying them. Therefore he runs about in denying, by far fetched speeches, and leaff he should be laid hold on, he denyeth nature to be of the race of Elements. As if it were enough to have said, there is a *Chymera*, or certain fabulous Monster, not of the Elements, but of the fifth Element of the Stars. It is not a body, not an accident: but a heat answering to the Element of the Heavens, not to the heat of the same. 20. And he would not say that;

that indeed, these things are so; but that they seem to him to be so. Seeing that according to the same man, many things may seem to be, which yet are not. 21. And if thou wilt not believe it, go to see, or expect it for ever. 22. As though the whole action of nature were made by heat. 23. Also that Mettalls, which elsewhere, he writeth to be co-thickned or condensed by their own cold; because they do abound with heat, should now be out of nature. 24. And as though the seeds of Vegetables, because they are not froathy, should not be endowed with fruitfulnesses, or should not contain nature in themselves. 25. Therefore he denieth the heat of living Creatures actually hot, to be Elementary (the which notwithstanding, I shall at sometime, in its own place, prove to be true) being unmindeful of his own maxim; that the cause is of the same particular kinde, with its thing caused. He knowes not, I say, that our heat doth make any other things to be hot, by a naked Elementary heat. And likewise, that since not onely Elementary heat (which he placeth in the sublunary fire, distinct from the common or kitchen fire) but also the kitchen fire, do heat us in a degree fitted to us: Therefore they ought to be of one and the same species, or particular kinde. 26. At length he rashly affirmeth, that nature, or the power of the Soul, or seminal truths, are nothing, besides that heavenly heat. 27. Therefore, he acknowledgeth heat, actually cold in Fishes, to be the cause of fruitfulness, seeing it distributeth from every power of the Soul. For that is to have sold trifles, instead of Philosophy. And as oft as he seareth, his toys are not saleable, he provokes us to the Element of the Stars: after that, he had provoked us, (it seemes) by one affirmative, and many trifles of denyalls, to the proportion of the Element of the Stars. Surely it is a shame for Christians, as yet, to follow that Patron in natural Philosophy; seeing that we believe by Faith, that Plants budded forth by a seminal virtue, before the Stars arose. For in Nature, there is alway found the Agent, the matter, and thing brought forth, or the effect, the instrument, and the disposition. But every Agent, measureth his instrument, and fits the dispositions, unto the end or finishing of the thing produced. But heat, whether thou wilt have it Elementary, or heavenly, may indeed be a disposition brought forth by the Seed, and likewise the Instrument thereof: but it can by no means be a seminal Agent, measuring, and squaring its dispositive Instruments. For neither is the operation of heat, any other than to make hot, whether that thing be called Elementarily, or Firmamentarily. Therefore the operation of heat in generation, is not ordained for the end of specifical dispositions, and much lesse is it directed to the bringing in of a specifical thingliness. For if that heat should be this seminal Agent, or the nature of Seeds, besides that, it being one, hath so many specifical differences, as there are kindes of things generated in Nature; it ought to have, without it self, an Instrument (seeing that it is not granted to be, without essential properties) measured, and manifestly limited, to the bringing in of any kinde of specifical thingliness: but no such Instrument, or mean, is present with heat: therefore the co-measuring of every Instrument, according to quantity, manner, motion, figure, durance, and the appointments of any operations whatsoever, dependeth on the seminal Agent, in which such kindes of co-measuring knowledges of proportions are, and no way on heat.

7 For seeing the knowledge of natural truth, doth necessarily depend on nature, and the essence thereof, Aristotle, who was ignorant of the thingliness of nature, also knew not the truth thereof, and so prostituted nought but his own dreams to be diligently taught in Schooles. Truly the operation of generation depends on nature, and its proper Instruments. He therefore that looks on heat, for every Instrument of nature, and accounts this very Instrument for the seminal and vitall nature: he supposeth one of the Kings Guard, to be the King, or the File to be the Workman. Yea heat, as heat, is not indeed the Instrument proper to nature: but a common adjacent, concomitant, and accidental thing produced in hot things onely: but the knowledge of nature, and essence, is not taken from improper, adjacent, and accidental effects: but from the knowing of Principles, which hitherto (even as it plainly appeares) the Schoole of the *Peripateticks* hath been ignorant of. I say the Principles of nature are the matter and the Agent. But the Principles of Bodies are water, and the seed, or vulcanic, things answering to both Sexes: which thing I will by and by, teach in its place.

8 Wherefore since Aristotle knowes not the nature, properties, and likewise the causes, and thingliness of generations, who shall not shew, that the Schooles have hitherto drawn the waters of Philosophy out of dry Cisterns? For his eight Books of natural

tural Instructions, do expound Dreams, and privations, instead of the knowledge of nature. I say they do suppose a matter, or impossible corporeity or bodylines, with Mathematical abstraction, for the principle, prop, and seminary of nature: The which, as it never existeth: neither shall it have the efficacy of beginning, or of causing.

Likewise privation is given to be drunk down as another Principle, which the Schooles themselves do rashly confesse to be a meer [*non ens*,] or a non-Being. And at length they diligently teach, surely by an over rash dotage, the form, which is the end, top, and utmost aim of appointment, and the thing it self produced, for a beginning of nature: to wit, they place the effect in the room of a Beginning. But in another Book, he sets to sale the causes of nature, for Principles: to wit, the matter and form, privation being omitted. As I shall sometimes shew, concerning causes. As though they were the Principles of nature, or could principiate by causing. But fortune and chance, as if they were the proper passions of nature, are handled in a particular Book. For events do not deserve a place in the contemplation and Doctrine of nature.

Lastly, a Vacuum or emptiness, and an Infinite, things not belonging to the knowledge of nature, and well nigh privative things, or plainly negative, have obtained his treatises. But time and place, the Schooles do no lesse ignorantly, than impertinently, reckon among the lessons of nature. And last of all they bring in locall motion, as it serves to Science Mathematical, or Learning by demonstration, alike foolishly, and with an undistinct indiscretion, into nature.

Certainly I could wish, that in so short a space of life, the Spring of young men, might not be hereafter seasoned with such trifles, and no longer with lying Sophistry. Indeed they should learn in that unprofitable three years space, and in the whole seven years, Arithmetick, the Science Mathematical, the Elements of Euclide, and then Geographie, with the circumstances of Seas, Rivers, Springs, Mountains, Provinces, and Minerals. And likewise, the properties, and Customs of Nations, Waters, Plants, living Creatures, Minerals, and places. Moreover, the use of the Ring, and of the Astrolabe. And then, let them come to the Study of Nature, let them learn to know and seperate the first Beginnings of Bodies. I say, by working, to have known their fixedness, volatility or swiftness, with their seperation, life, death, interchangeable course, defects, alteration, weakness, corruption, transplanting, solution, coagulation or co-thickning, resolving. Let the History of extractions, dividings, conjoynings, ripenesses, promotions, hinderances, consequences, lastly, of losse and profit, be added. Let them also be taught, the Beginnings of Seeds, Ferments, Spirits, and Tinctures, with every flowing, digesting, changing, motion, and disturbance of things to be altered.

And all those things, not indeed by a naked description of discourse, but by handicraft demonstration of the fire. For truly, nature measureth her works by distilling, moystening, drying, calcining, resolving, plainly by the same meanes, whereby glasses do accomplish those same operations. And so the Artificer, by changing the operations of nature, obtains the properties and knowledge of the same. For however natural a wit, and sharpness of judgement the Philosopher may have, yet he is never admitted to the Root, or radical knowledge of natural things, without the fire. And so every one is deluded with a thousand thoughts or doubts, the which he unfoldeth not to himself, but by the help of the fire. Therefore I confesse, nothing doth more fully bring a man that is greedy of knowing, to the knowledges of all things knowable, than the fire. Therefore a young man at length, returning out of those Schooles, truly it is a wonder to see, how much he shall ascend above the Philosophers of the University, and the vain reasoning of the Schooles.

First of all, he shall account it a shameful thing, for the Schooles to be ignorant (for example) in an Egge, that in that space of time, while it comes to be a Bird, a thousand dispositions do succeed each other in the way, and all of them to be external, and accidentary to the Seed: neither that in the mean time, it ceaseth to hasten to the aims of its appointment. For the figure of the yolk of the Egge, together with accidentary dispositions succeeding each other, do passe over it indeed: yet there is not a new generation of the form of that putrified Egge, present at every disposure of the putrification. Indeed, one onely vitall form of the Chick being excepted, there comes to it no other: which by degrees is stirred up by foregoing dispositions, and at length, the ripeness of dispositions being attained, floweth into it. For neither when the Bird dyeth,

dyceth, is there a certain essential form, and generation of the dead Carcase. Because all generation in nature, is enclosed in an essential form, which a dead Carcase wanteth, even as also a seed, and an Archeus, the Governour, as shall be shewed in its place. Even as the essence begins him with the *Vulcan* of the Seed, and the same essence continues with the product, or thing generated: so the same product failing, the same essence perisheth. But the essence perishing, the form, the Governour or President thereof, also goes to ruine. For the *Vulcan* or Master-Workman forsaking the body, the flesh, heart, veins, &c. do begin to putrifie, for that they are now deprived of the vital Balsam their leader. For under life, the flesh, and the bone, &c. were distinguished. In its particular kinde, and proper form, the flesh was flesh, and was formally severed from the bone, in which form, in the dead Carcase, they do forthwith appear. And so, through death, no form, or essential thinglinefs, comes upon the dead Carcase, in the whole, or in any particular parts. Onely that which was vitall, is seperated.

- 15 Therefore let it be an erroneous thing: That the corruption of one thing is the generation of another. Because the corruption of life happens onely through the quenching of the vitall Balsam, or form, therefore without a new generation of a Creature. Therefore no privation happens in things that have life, and so neither can privation there, have the force of a Principle: Seeing that from the seed, even unto the vitall being, there is but one progress, promotion, and ripeness; about the end whereof, the form is given. Therefore also, generation doth reciprocally or cursarily happen, without any corruption, as often as the matter being now brought to the ripeness of its appointment, by the seminal *Vulcan*, hath obtained a form coming to it from elsewhere. Yea that *Vulcan* through the departure of life, departs, flies away, and vanisheth, without any corrupting of it self, no otherwise, than as light perisheth without the corrupting of it self. Indeed life vanisheth, after the manner of light perishing. And the *Vulcan*, seeing it is a certain vitall Air, fleeth away. Both of them, without the corruption of themselves; and the body, which is deprived of life, properly (for that very cause) is not corrupted: although through the failing of the vitall Balsam, corruption doth soon succeed. Which thing sufficiently appeareth in Mummies, and also in Vegetables, which being dry, and deprived of life, are kept for uses, yea they do very often, drive away all corruption. So far of is it, that their life perishing, for that very cause they should be corrupted.
- 16 Therefore death in things that have life, is not the corruption of their own life, as neither of that which lives: but the extinguishing of life. And although in some things, the corruption of the body may follow: truly that is to life, and the body by accident: which thing is manifest. For truly, dead Carcases are preserved from corruption by art. Therefore now *Aristotle*, confounds privation with corruption, and doth not distinguish his own Principle [*non ens*] or a non-being, from the [Being,] corruption.

- 17 Lastly, the forms of things are not subject to corruption; and therefore neither are they corrupted: but annihilated or brought to nothing. Wherefore neither can the withdrawing, or the extinguishing of the form, include any corruption on behalf of the form. Furthermore, I have hated Metaphors, or figurative Translations of words from their proper signification to another, in the History of nature, and Family of essential things: because they are those things, which have introduced the errors of the Schooles, brawls of disputing, and religious Worship given to *Aristotle*. But besides, if *Aristotle* be unskillful in nature, and ignorant of all natural Philosophy, truly *Galen* hath hitherto, every where manifested a greater ignorance.
- 18 For first of all, I will make it manifest, that there is not a quaternary, or a fourfold kinde of Elements, nor a congress or conjunction of these, for bodies which are believed to be mixt: much less a strife, or fighting of qualities or Complexions, or for the Causes of Diseases. And so that neither doth the Treatise of the Elements properly belong to Medicine. Truly I finde *Galen* diligent in opinions, and a boasting Writer, without judgement, or discretion. For neither hath he better perceived of Nature, Diseases, Causes, and defects, than of the decrees of *Hipocrates* and *Plato*.
- 19 For I profess, I have twice read over those Volumes of *Galen* with attention, but I have found the poverty and undistinct ignorance of *Galen*, to fight with his rashness. For truly those Books, do touch at nothing lesse than the Doctrine of *Hipocrates* or *Plato*. Neither also hath *Hipocrates* any thing common with *Plato*. And so that I have not found any one, who hath judged them worthy of a Commentary, as neither to have been written concerning the preserving of health. This one thing is alway

way to be found in *Galen*, that the names of Authours being suppressed, he hath willingly snatched the Inventions of others to himself; a man wholly scanty, or very poor in judgement, as oft as he hath expressed the conceptions of his own judgement. I ought to declare these things concerning the two Standard-Defenders of natural Philosophy: that the Schooles may abstain from worshipping these Masters.

CHAP. VIII.

The Elements.

1. *The Doctrine of the Elements, in healing, is wholly impertinent, and so that in Galen, such a heap of those Books is ridiculous.*
2. *The vain opinions of the Schooles concerning the Elements.*
3. *The true beginnings of naturall Science, are delivered.*
4. *Six conclusions out of the holy Scriptures.*
5. *That there are onely three Elements.*
6. *The Content of the Heavens.*
7. *That there are two first-born Elements.*
8. *That Fire is not an Element.*
9. *The Error of Paracelsus, touching the matter of the Heaven.*
10. *A Quaternary of Elements, for the mixtures of Bodies, and for Diseases, falls to the ground.*
11. *A Proposition; that all things which are believed to be mixt, are materially of water onely, with a mechanickall or handicraft demonstration.*
12. *What the Elementall, and Virgin Earth is.*
13. *From whence the two Elements may be called, the first-born.*
14. *An objection from artificial things.*
15. *The force of the artificial fire of Hell.*
16. *Another objection from Arts.*
17. *Why the Water may be reckoned the first-born Element.*

MY fight is carried on a useful good, but not on vain reasoning. Wherefore seeing the Auncients do call back nature, and every of its operations, to the account of Elements, Qualities and Complexions, resulting in mixture, and the Schooles do even to this day, hand forth this Doctrine to their young beginners in Medicine, to the destruction of mankind; I will again and again, set upon the dissection of the Elements, whereby it may appear that they have erred hitherto, in the Causes of Diseases. I will every where, relate Paradoxes, and things unaccustomed to the Schooles, and it will be hard for those to cease from the Doctrine drunk in, who do believe, the whole truth to have flowed into *Galen*. *Galen* hath delivered in many Volumes, and with a tedious boasting of the *Greeks*, that every Body, the Earth, Water, Air, and Fire excepted, doth consist of the Wedlock of these four united together, and so from hence, that a Body is to be called mixt. Moreover, that the whole likeness and diversity of bodies, doth arise from the unlike conflux or concurrence, and continual fight of four Elements. But the Schooles that came after, do as yet dispute it as undecided, whether the Elements with their forms, do remain in the thing mixt; or indeed, whether in every particular mixture they are deprived of their essential forms; and the which, by a peculiar indulgence, they do re-take from the seperation, and general privation of the form of the thing mixed. At length, from the unlikeness, and combate of the Elements, they bid all the infirmities, and first-born fewels of our mortality to descend. Surely, it is a wonder to see, how much brawling and writing there hath been about these things: and it is to be pitied; how much these loose dreams of trifles, have hitherto circumvented or beset the World: they have prostituted destructive vain talkings in the faires of the Schooles; instead of the knowledge of Medicine, and so, so damnable a delusion, hath thereby deceived the obedience of the sick, in healing. Therefore the juggling deceits of Pagans, being cast behinde me, I direct my experiences, and the light freely given me, according to the Authority of the holy Scriptures, at the beholding of which light, the night-Birds do

do fly away. Therefore it is chiefly to be grieved at, that the light of truth being had, darkness is as yet taught in the Schooles of Christians. In the beginning therefore, the Almighty created the Heaven and the Earth, before that the first day had shone forth. Afterwards in the first day, he created the light, and divided it from the darkness. Secondly, he created the Firmament, which should separate the inferior Waters from the waters that were above it self, and named that, Heaven. Therefore it is hence plainly to be seen, that before the first day, the waters were already created from the beginning, being partakers of a certain heavenly disposition, because they were hidden under the Etymologie of the Word, Heaven. Yet they were a-kinne to these lower waters, to which they were once conjoynd, before their seperation. In the next place, that darkness covered the face of the deep, and that, that deep did point out the Waters: because then, all the Waters above the Heaven, being as yet conjoynd to ours, upon the Earth, did make an Abyffe of incomprehensible deepness, upon which, the Spirit (whose name is Eternall) was carried, that he might with his blessing, replenish his new Creature of water. Therefore it is manifest, that the Creation of the Heaven, the Water, and the Earth, was before a day, neither that it may be numbred with the six dayes Creation, afterwards described. Because it pleased the Eternall, also to rest on the seventh day, which in respect of the aforesaid Creation, would have been the eighth, if it had been a day. And therefore it is not reckoned among the number of dayes, because the Creation of the Elementary matter was made before a day sprang forth. Lastly, by this Text, the Firmament is not onely the eighth Starry Heaven: but and also that, which, by our Authority, we distinguish into seven wandring Orbs or Circles. Which the teacher of the *Gentiles*, hath seemed to contain in one: But the *Chrystalline*, and first mover, for another: and at length, the huge Heaven of an incomprehensible greatness, wherein every righteous man shineth like the Sun, for the third; although that *Empyrean* Heaven joyned with its two fellowes, being taken for the second, perhaps another may remain for the third. Which may be the bottomless retiring place of Fountain-light, full of Divine Majesty, and unsearchable. At leastwise, the Firmament reacheth from the Moon, even to the conjoyning of the Starry Heaven, and separateth the water that is above it, from these lower ones, and therefore the Heaven, with the *Hebrews*, soundeth, [where there are waters.] But the Lights, and the Stars, began on the fourth day, and were set in order in the Firmament. Therefore, in the beginning, the Heavens, Earth: and Water, the matter of all Bodies that were afterwards to arise, was created. But in the Heaven were the Waters contained, but not in the Earth; hence I think the Waters to be more noble than the Earth: yea, the Water, to be more pure, simple, indivisible, firm or constant, neerer to a Principle, and more partaking of a heavenly condition, than the Earth is. Therefore the Eternall would have the Heaven to contain Waters above it, and as yet something more (by reason whereof it is called Heaven) that which we call, the Air, the Skie, or vitall Air. For therefore neither is there mention made of the creating of the Water and Air, for that, both of them, the Etymologie of the Word, Heaven, did include. Therefore, I call these two Elements Primigeniall, or first-born, in respect of the Earth. But no where, any thing is read of the Creation of the fire: neither therefore do I acknowledge it among the Elements, and I reject my honour or esteem with Paganisme. Neither also, may we with *Paracelsus*, acknowledge the fire, by the name of Lights and Stars, to be a superlunary Element, as neither to have been framed from the beginning: the which notwithstanding, it should needs be, if it ought to resemble or partake of the condition of an Element. Therefore I deny that God created four Elements; because, not the fire, the fourth. And therefore it is vain, that the fire doth materially concur unto the mixture of bodies. Therefore the fourfold kinde of Elements, Qualities, Temperaments or Complexions, and also the foundation of Diseases, falls to the ground. For our handicraft operation, hath made manifest to me, that every body (to wit, the Rockie Stone, the small Stone, the Gemme or pretious Stone, the Flint, the Sand, the Fire-stone, the white Clay, the Earth, costed or boyled Stones, Glasse, Lime, Sulphur or Brimstone, &c.) is changed into an actual Salt, equall in weight to its own body, from whence it was made: and that, that Salt being sometimes forced to a mixture with the Circulate Salt of *Paracelsus*, altogether looseth its fixedness, and at length may be changed into a Liquor, which also at length passeth into an un-savory water: and that, that water is of equall weight with its Salt, from whence it sprang. But the Plant, fleshes, bones, Fishes, and every such like, I have known how

to reduce into its meer three things; whence afterwards, I have made an un-favory water. But that a Metall, by reason of the undissoluble co-mixture of its own seeds, and the Sand (*quellem*) are most hardly reduced into Salt. I have learned therefore by the fire, that God before there was a day, created the Water and Air, and of the Water an elementary Earth, which is the Sand. *Quellem*. Because it was the future Basis, or foundation of Creatures, for man their Standard-defender: and therefore, in the very beginning it ought to be created, although in its own nature, it was not truly primo-genial, or first-born. Wherefore I finde two onely primitive Elements, although there is mention made of neither, in the holy Scriptures, because they are comprehended under the Title of Heaven. But with the two, he also created the Earth. Wherefore he created two great Lights; that the Moon, and the lesse, by shining, might govern the Water: but that the greater, should shine upon the Earth. But I shall by and by reach, that these first-born Elements, are never changed into each other.

Indeed the Water putrifying by continuance, in the Earth, doth obtain a locall, or implanted Seed. And therefore it passeth either into the Liquor (*Leffas*) for every Plant, or into the Minerall juyce (*Bur*) according to the particular kindes, chosen by the direction of the Seedes. Which Seedes, are replenished by the Ferment of the Earth, at first, empty and void, and then straightway, by the blessing of the Spirit boren upon the Waters. But my experience of the fire, hath taught me, to wit, that the three first things, the Salt, Sulphur, and Mercury of the Water, do alwayes remain undivided, whether in the mean time, the water be lifted up in manner of a Vapour, in the form of a Cloud, or be made thin like unto invisible things, or at length also it doth steele in its antient shape of water. For, that *Paracelsus* would have the water, by evaporating, to be wholly brought to nothing; let that be his own *Idiotisme* or property of speech, at leastwise not to be winked at by the ingenious Distiller. Truly I have certainly found, that the water being lifted up into the Atomes or Moats of Clouds, yet doth alway remain the same, in number and water, in kinde, which the Atomes of the *Mercury* of the water, do shew to us in the likeness of a Cloud. But there is never made in the water a separation of the three former things, and much lesse any essentiall transmutation or changing. For truly there is a simple turning outward of the inward parts by the fire, the which again return inward, as oft as the Vapour is co-thickned into drops. But the cause why I may think the Earth not to be reckoned among the primary Elements, although it was also created in the beginning, is, because it may at length be turned into water by the depriving of its essence. And therefore I believe the water to be the first and most simple body; seeing that never returns into Earth, but by the vertue of the Seeds, and so the water takes the turns of a composed body, before the Earth or Sand *Quellem*, be made. Which thing, I shall hereafter more largely demonstrate.

CHAP. IX.

The Earth.

1. That the Fire is neither an Element, nor co-mingled materially with Bodies, nor that it is a matter, nor that it hath a matter in it.
2. The Earth is not a part of the thing mixed.
3. The Virgin-Earth is demonstrated by Handicraft operation.
4. Grounds or Soils in the Earth, are distinguished.
5. The Water within the Earth, doth more than a thousand times exceed the water of the Sea, and Rivers.
6. The true Original of Fountains.
7. How Waters do of their own accord ascend.
8. The continuity or holding together of a thread is proved, in the Waters.
9. By what chance, the Earth happens to Bodies, that are believed to be mixt.
10. The number of Elements, and their temperaments, are most destructive trifles, after that the same are translated into the art of healing.
11. The Earth is the Wombe, but not the Mother of Bodies, and that is demonstrated by many Arguments.
12. Water and Air do not convert any other thing into themselves.
13. What kinde of thing mixture is, and what the adjoyning or application of Bodies.
14. Objections concerning Glasse, and the Tile or Brick are resolved.
15. The Operations of the Fire of Hell.
16. How out of Glasse, Sand may be safely separated from its Alkali or Lixiviall Salt.
17. That the Center of the World is sometimes changed.

1 **T**herefore, neither is the Fire an Element, nor is it materially co-mixed in Bodies; because I will shew, the Fire neither to be a matter, nor to have it in it self. Yea the Earth doth no where offer it self to be co-mixt with any natural body besides it
 2 self, which may be re-taken thence by any labour. Therefore I have lamented, and
 3 been angry with my self, that the foundation of healing hath been flust with trifles, and that the sick should be constrained to yield obedience to so great mockeries. But
 4 I name the original Earth, of the Virgin-Element, the constant Body of Sand it self: but the rest of every kinde of Earth, the fruit of the Earth, from a Mineral off-spring. The which by the art of the fire, is sufficiently and over proved. For, that the Sand is the original Earth, first of all, its hard reducement into water, proveth; because the Sand out of a flint, or an Adamant, may be sooner reduced into water, than the Sand, *Quellem*. And then, that thing also the Spade proveth, because in digging, truly divers Soils do meet nigh the light, indeed made to differ in colours, and thickness, and the which, although by the rustical or homely Etymologic of the Schooles, they are believed to be black, white, yellow, read Earths, &c. yet they are fruits of the Earth, and do consist of a Seed: under which, is a Sand, also elsewhere manifold in its varieties of Soils, as well in one onely, as in divers places: at length, under those, doth the Sand reside, which our Countreymen call, *Keybergh*, or the flinty Mountain, from whence do flow the originall of Rocks and Mountains, and the chief riches of Mines. At length (the last of them all) the white or boyling Sand *Quellem*, doth shew it self in a living and vitall Soil, which the Spade or Mattock never pierceth. For how much soever Sand, and Water thou shalt take away from thence, so much doth there succeed in the room of that which was taken away, filling up again the same place. This Sand I say being unmixt, is a certain Hair-cloth, or sieve, and the foundation of nature, by which, all waters are strained thorow, that all of them may keep a Communion among each other, from the beginning of the Creation, unto the end, and from
 5 the Superficies or upper part of the Earth, even to its Center. And moreover, the water detained in this Soil of Sand, is perhaps, actually greater by a thousand fold, than the whole heap of Seas and Rivers floating on the Superficies of the Earth. And that is easily verified, by supposing, the whole superficies of the Earth also to be covered with waters to the depth of 600 paces. Therefore it followes, respect being had to the Diameter of the Earth, that there is easily a thousand times more water, under, than

than upon the Earth. For truly dry Sand, drinks up at least, about a fourfold quantity of water, in the same extension of place: yet I will not have it, that although, the *Quellem* be the last ground or Soil to the Digger, that all subjected grounds are every where to be found by order. For the aforelaid Sand, which sometimes overwhelms it self perhaps to a thousand paces beneath the Horizon, elsewhere boils up with speed under the open Air, yea, and oft-times in the top of Mountains. Of which thing the Schooles, with their *Aristotle*, being ignorant, do roughly hold, that all true springs do owe the cause of their continuance from the Air co-thickned into water, when as notwithstanding, they cannot maintain that thing; because in the tops of the highest Mountains, springs do oft-times leap forth, where another Mountain of the like height is not neer, nor a water-Channel extended on either side to this. Therefore they hold their peace with a lofty look, and are silent at the unwonted miracle of the thing.

Surely, as long as waters do wander in the living and vitall Soil of the Earth, and are detained in the Sand *Quellem*, so long I say they are not constrained to bring forth by the water drawing lawes of Situations. No otherwise, than as the blood, while it is nourished with life in the veins, so long also, it knowes not above and beneath, and it is as well in the fore-head as in the feet. But at the very moment, wherein it once falls out of the veins, or the waters do disgorge themselves out of the *Quellem*, they cease not to flow down by obeying the lawes of Situations. Therefore the Sea in its own ground, doth sup up the received waters in the sieve of the Virgin-Sand. For so, according to the wise man, however all waters do flow into the Sea, yet it never re-gorgeth them again. Because by one onely thread, there is a continuall passage out of the Virgin-Sand, into Springs, Streams, Rivers, and the Sea, to moisten the Earth, and appointed to enrich it with Mineralls. Whither again, the waters being driven, they are supt up partly by the *Quellem*, and partly do snatch the Air. So indeed, doth the Universe distribute its waters, and lay them aside for divers fruits. And therefore I have meditated with admiration, that the Almighty hath set before him the necessities of ungrateful immortal men, as the aims of things. I return to the Earth. I have found for certain, that the original Earth doth no where of its own accord concur to the mixtures of fruits, slide thereto by chance, nor that it is assumed by nature, nor is found to have assumed the works of nature or art.

And therefore the reason of mixtures waxeth lean, the number of Elements, Qualities, and Temperaments ceaseth; and so they are lying fopperies, which have been hitherto stilly and ignorantly garnished out by the Schooles. For of a man, Wood, &c. be it dust, or ashes that is left by the fire, yet Earth is never drawn out: for else our burying places would soon swell. Therefore the Earth is at least the remaining wombe, but not the Mother. Which if it should sometimes have a conflux unto fruits or mixt bodies: it would either abide in the same, and so by the solution of art or nature, would sometimes be found, or should return from thence (which is false) or plainly should be taken to the mixt Body, and in it should cease to be Earth, being already changed into another thing: and so should be elsewhere diminished (which I will straightway shew to be alike false) or by the death, or dissolution of the thing, should return again into earth, and there should be a daily and repeated returning of one and the same Element, from a privation to a habit. Or if this should not return into earth, it should remain changed into fruits, and so the whole Earth had long since gone into fruits, and nature had lost her constancy, and had mocked the first aims of the Creator, or the earth had returned from the dissolved mixt body into another Element: the impertinency whereof ceaseth. For truly, it is not natural to water or air, to turn another Element into its own substance. From hence I will straightway demonstrate, that never one drop of water is turned into air, or likewise air changed into water. Which changes notwithstanding do appear lesse laboursome, than of the earth into water, or into air. And therefore if nature hath not as yet attempted the more easie transmutations; after what sort shall it presume on the more difficult ones? For otherwise, the earth should be supt up and brought to nothing by *Elements* that are so much more large, co-touching with it, and more active. But the Father of the Universe, being a lover of Concord, hateth discord and brawlings, and chiefly in the *Elements*, which, that they might be the stable props of nature, he hath not created the same, fighting ones. For he hath also directed the *Elements* to their appointed ends, and lawes of continuance, to wit, that he may bring forth, and nourish

rish his own fruits, for his own honour, and the use of man. Notwithstanding; neither the honour of God, nor mans necessity, did any where, or any way require; the battels, devourings, strifes of the *Elements*; their trampling on each other, as neither the exchanging, or nourishing of one by the other. Nor lastly, is it the end of an *Element* to increase it self by covetousness, hunger, luxury, or necessity, with the destruction of another. For neither are they guilty of the fault of covetousness, or hatred, as neither do they desire to be nourished. Last of all, neither have the *Elements* obtained an *Archeus*, a kitchen, or properties for that transchanging. Therefore the whole Doctrine of the Schooles concerning the elementary War, is an old Wives tale.

- 13 Therefore the earth is never taken, or of its own accord doth materially run out of it self, into the constitution of bodies. And there is by right, made no mixture in nature, which can firmly grow together under the unity of the natural composed form, unless it be between juyces and spirits. On the contrary, no pulverous or powderall co-mixture doth tend to generation: but there is onely an apposition or applying, presently of its own accord, and again quickly decaying. Therefore all earth, Clay, and every body that may be touched, is truly and materially the offspring of water onely, and is reduced again into water, by nature and art. Neither doth that hinder, because of Clay and sand, a Tile or Brick is boyled, even as of sand and ashes, Glasle. For truly, whatsoever is of Clay, is at length of its own accord resolved into a salt, the same sand remaining, which the clay had contracted into it self. Glasle also, as it hath passed, by art, and without a seed, into an artificial composition: So by art again, its bond being unloosed, it returns to its auntient Beginnings, so that sand is drawn out from thence, altogether the same in number and weight, the which by the flowing of the Furnace, had grown together with the fixed salt, into a clear stone, or glasle. For from hence it appeares, that the sand, or the Element of the earth, doth never concur to natural and seminal generations. And that as oft as it serves for artificial things, so often the sand doth alway remain unchanged in the bright burning-glasle, being hidden in the flux of the salt, and taken into transparent glasle. For silver hath not lost its being, when it is dissolved by *Aqua Fortis*, although the Eye hath lost that thing, and it hath obtained a clearness like Christall. Seeing therefore, the Sand or original earth, doth resist as well art, as nature, neither can it by any helps (the one onely fire of artificial Hell-fire excepted) of nature or art, depart from its first-born constancy (under which artificial fire, the Sand is made salt, and at length water, because it hath the force of acting upon any sublunary things, without a re-acting) it followes also, that the original earth is never by any meanes taken unto the seminall generations of nature. Neither doth that convince, because some unskillful man will have glasle to be the last subject of art, and the which can therefore be blotted out, neither by art, nor by fire. For he will be instructed, if he shall comelt the fine powder of glasle, with more of the *Alkali*, and shall set them forth in a moyst place; he shall straightway finde all the glasle to be resolved into water: on which, if *Chrysulca* be powred, so much being added as sufficeth to the filling or satisfying of the *Alkali*, he shall presently finde in the bottom, the Sand to settle, it being of the same weight, which at first was fitted for the making of the glasle. Therefore the Earth remains unchanged, although it may seem throughout the whole World, to be moveable, and to have been moved. Yea a mold, by digging thorow an heap, makes an inundation of a great tract or space of Land, and so the despised Creature, can remove the Earth from its Centre, and the World from its place, if we believe the Centre to hold the place of an equall tenor or height: and we do see the Seas lately to fall and lean on the back of the earth. In *Rehem*, nigh the passage of the River *Mose*, a Sea-ship was found under a sandy Hill, in the year 1594. In the Region of *Peete*, Pine-Trees were found standing in rank, under the Earth, which willingly grow not but in Mountains. In *Hingsen* nigh *Scalds*, twelve foot under the Horizon, in a moyst Meadow, was found an *Elephants* Tooth, with the whole Cheek-bone, whose third part, being two foot long, I keep with me. And so living *Elephants* were once in this Countrey. But, very lately, *Greenland* hath ceased to be found subverted by the Sea, whence the Centre of the Earth ought necessarily to be changed or removed.

CHAP. X.

The Water.

1. The situation of the Earth and Water before the Flood. 2. The Authors Meditation. 3. A Whirle-pool of Waters, or a Gulf. 4. The distributing of that Whirle-pool. 5. The cutting of the veins of that Whirle-pool. 6. The fruit of the Minerall Soil or Ground. 7. Salts do passe into Bar. 8. The progresse of Mineralls to their ripenesses. 9. From whence Fishes are digged out of the Earth. 10. The right of the veines over their contained Liquor. 11. The scanty place of the wise man Coleth or the Preacher. 12. The rise of Fountains, were unknown to Aristotle. 13. That the World is round from East to East: but from South to South, that it is long and round. 14. A prevention of Objections. 15. The Centrall property takes its limitation from necessity. 16. A Reason from Springs. 17. From the motion of the Sun. 18. From the true figure of the Heaven. 19. From the authority of the holy Scriptures. 20. From shadowes, and the quantity of the day. 21. From the sight of the Sun by Saylor.

IN like manner, after that the Firmament did seperate the waters from the waters, the Eternall gathered together the sublunary ones, and their Collection, he called Sea. From the opposition of a Diameter, the dry Land appeared, which he named Earth; and both these framed one Globe, the which in the middle of the Earth, should be therefore a little more eminent or standing out, because in the midst of the earth, it should gape with a huge gulf, from whence a Fountain should break forth, appointed for the moistening of the earth. For if neither besides the wonted roundness of the Globe (whereby all lines do equally differ from their Center, within their Circumference) the earth in its middle, had not been far deeper, the Fountain could not have thence run down unto the more steep Sea: but straightway from its beginning, had stood as a pool. Whence I conceive, that the earth in the beginning, was continuall or holding together, and undivided. Because it was that, which wholly ought to be watered by one onely Fountain. Lastly, neither that it had Islands; but the whole Globe shewed in one part Sea, and in the other Land. This indeed was the face of the World before the flood. Under which afterwards the earth did cleave into divers divisions, and from the deep pit of chaps, the waters abundantly brake forth. The great falls of waters as well of the lower abyse, as of the Heavens, were opened, that they might wholly drown the whole Globe of the earth.

Great God! thou intendest to cut off thy Vine from the unprofitable branch, and to punish the World for its desert, but yet thou couldest not abstain, but being mindefull of thy Fatherly affection; in the midst of thy most just anger, thou seperatest the earth, and rentest it asunder for their greater profit, necessity and Commodity. The Sea which being onely one, stood onely on the whole side of the Globe, thou sendest over into divers Coasts of the earth, neither cease thou from a new blessing upon the ungrateful work of thy hands. For upon the earth guilty in thy sight, thou abundantly powrest out the lively effusions or showers of thy super-celestiall waters, which do far exceed the dew in fruitfulness. But the earth, being sufficiently made drunken with them, again appeared, and incontinently returned to her wonted Workmanship. At length, the one onely Fountain, and Spring of waters, which thou hadst placed in the heart and top of the Earth, is afterwards spread abroad into a thousand veins, which did almost every where pierce thorow the Globe of the earth, to far better uses. And moreover, thou hast also dashed the Sea almost into every Creek of the earth, that there might be the greater fellowship of Mortalls thereby. Therefore if thy punishment be blessed and happy; what shall the free gifts of thy blessings be? Oh Lord, keep us for the exceeding greatness of thy goodness, within that number, who shall praise thy great and mighty deeds for ever, in the sanctifying of thy name.

But

3 But although that one onely Fountain now ceased, neither Lands being now rent
 afunder, one alone was not enough, yet perhaps the same entrance of waters remain-
 ed. Because, in the sweet Sea, between *Roelt* and *Loefelt*, according to the Table of
Gothland, a Gulf of waters is described by *Olaus*, whereinto Ships, Marriners being not
 aware, and their endeavours being in vain, are supt up. For indeed it is the mouth, into
 which the waters of that Ocean do fall, and by one onely passage, were before the
 Floud, carried thence unto the aforesaid Fountain. But afterwards, that passage like
 the hollow vein, was diversly distributed, and hedged in by a Rock, by some thou-
 sands of veins ending upon the face of the *Quellem*, from which, afterwards, the wa-
 ters being drunk up, do hasten from far, unto their appointed offices. Moreover, that
 Whirle-poole or Gulf, if it ought to be any where, and *Olaus* be a true Writer, or if
 not, at leastwise, it is fiely in the Sea, as well for the sweetness of the Sea, as for the
 4 long and round figure of the World, by me straightway. To be proved. In the next
 place, if one onely Fountain were for the moistening of the Earth, the aforesaid
 Whirle-poole shall be sufficient, especially because the bottom of the Sea, hath the
 Sand *Quellem* longly and largely laying open, which would be sufficient for the drink-
 ing up the water. And the rather, because the Sea doth sometimes wash upon, and
 rince the earth on every side, and thorow many middle spaces. Therefore the Sea be-
 ing supt up in the said Whirle-poole, it is by little and little brought thorow stony
 5 Channels, and hence by lesser pipes, thorow a great part of the earth. Notwithstand-
 ing they are scarce overwhelmed beneath the Soil [*Keyberch*]: but as often as the veins
 of the Whirle-poole do cut, or touch at the *Quellem* rising up thorow middle pla-
 ces, and rushing forth into a Fountain, indeed the sweet veins do perish, and veins of
 Sea-Salt, are produced. Otherwise the briny Liquor, if there be also any in the *Go-*
 6 *thick* Sea, doth through the lively Archeus of the Earth, lose by degrees, the nature
 of Salts: or if the *Ferments* of Salts in places do any where exist, those very waters do
 put on the seeds as well of divers Salts, as of Stones and Metalls, and are changed
 into the same fruits. For so neat, gemme, nitre, aluminous, vitriolated, Sea, Salts do
 grow of the water, they as it were promising the first birth of the water to them-
 selves. And then from hence they do decline or decay into [*Bur*], or the first off spring
 7 of Mineraills, and degenerate by the guidance of the seeds. So some fruits of the water
 do stop up the passages of their own Fountain: and by their last ripeness, do attain
 the perfection of that Mineraill, whose appointments the seeds did bear before them,
 which were entertained in the *Ferments* of places. Moreover, as that Northern Whirle-
 8 poole or Gulf, doth also sup up Fishes within it, so it sups up the same exceeding small
 ones, the greater being detained within the Channels. Where oft-times, they are either
 made Rockie, or wax filthy through putrifying, or also are seasoned with the Balsam
 of the soils, as also that Fishes are oft-times found digged up, which the Husband-man,
 9 and others being amazed at, do think they were born in undue places, and without a
 feed. Furthermore, whether the Conduits have received the water, or at length have
 drunk up that *Quellem*: the waters are at least, there endowed with a lively and fer-
 10 minall property. For no otherwise than as a vein, even in a dead Carcase, preserv-
 eth the bloud contained in it, from coagulating or curdling (which is a corruption of
 the first degree): truly by a stronger Reason, that right agrees to the veins of the earth
 which is not yet dead. Therefore the water is supt and drawn within the lively soil
 of the Earth, whence it having gotten a common life (*Come let us worship the King,*
by whom all things live) it knoweth not the Scituations of places, it easily ascendeth
 unto the tops of Mountains without trouble, together with the *Quellem*, that it may
 11 from thence send forth fountains without ceasing. VVhich things surely being
 unknown to the Schooles, they have left that place of the wise man *Coheth*, or the
 Preacher, scanty or barren: where he saith, all Rivers hasten towards the Sea: the
 which notwithstanding doth not therefore re-gorge them again. For truly, Rivers do
 return to the place from whence they came forth, that they may flow again. Which
 words, have been corrupted heretofore with divers modellings or qualifications. Be-
 cause springs in the tops of Mountains, were not seen to proceed from the Sea, whither
 they at length do rush. Therefore Springs have been hitherto falsely judged by the
 Schooles to take their Beginnings and Causes, from Air condensed or co-thickned by
 the force of cold, between the hollow places of Mountains, ready to fall upon each o-
 ther. The which, I, in a little Book concerning the Fountains of the Spaw, printed in the
 year 1624 at *Leidon*, have shewne, that they have themselves after the manner now
 delivered in this place. Therefore the true originall of true Springs being manifested, it
 hitherto

hitherto remains unknown to the Schooles. The Scripture-Text, entire, and cleared. But seeing the same Law, course, and re-course of waters, from the *Quellem* into Fountains, and at length from Fountains into the Sea, was kept, no lesse in dayes wherein it hath not rained for three years and more, than when the whole year doth almost wax barren with a continual shovre: we must know, that it is sufficient for the Earth, that it doth not send forth such bountifull Springs through its Water-pipes, and steep-running Brooks, as by the common besprinkling of Dew and Rain. Moreover, before I shall come to the unchangeable substance of the water, wherein the Schooles do promise that Air is easily changed into water, and this likewise into it, I will first clear up another Paradox. To wit, that the Globe being composed of Earth and Water, is indeed round from the *East* thorow the *West* into the *East*: yet not from the *North* into the *South*: but long and round, or of the figure of an Egge. Which thing, in the first place hath much deceived Saylor. Because the Waters do slide with a more swift course from *North* to *South*, than otherwise from *East* to *West*. For very many Waters do alwayes descend by Rivers from the *North*, which do never run back unto the *North*. So the River *Danubius*, with many others, doth slide thorow the *Hellespont* or *Greek Sea*, into the *Archi-pelago* or chief Sea: the Waters descend, neither doth any thing return from the *Mediterranean Sea*. Whatsoever doth once descend into the *Mediterranean*, is never spread into the Ocean. For the River *Nilus*, alwayes descending in a right line from the Mountains of the Moon, is wholly plunged into the *Zeburitan Sea* with its dresles: neither doth the *Mediterranean Sea* in the mean time increase, nor become the saltier. Which thing notwithstanding should be altogether needful so to be, if in manner of a naked vapour, the waters powred into it, should exhale out of the Sea. But the Eternal wisdom, hath in most places made the *Mediterranean Sea* deeper than the Ocean, that the Virgin-Sand might drink up the Waters together with its Salts, like a sieve. For mans necessities (which do seem to have dictated a Law to God, out of his goodness) did require Springs and Rivers falling down from the highest tops. Lastly, the waters being turned forth of the *Quellem*, by Fountains do (by a continuation) draw after them, the following waters, and therefore also, in the bottom, do they drink up the Sea-waters by supping. Therefore properties are added to places by Divine Providence, by reason of necessities. The flowing of the *North Sea* about *Kent* of *England*, doth prevent or go before the flowing of the *West Sea*, almost for half an houre. Whence I conjecture, the Earth and Sea to ascend in the *Northern Climate* or Coast. For the whole *Northern Earth* is named *Scandia* from *Scandendo* or climbing. And the *North Sea* should not be frozen to ice, if it were salt. If it be sweet, it points out, that the Salt of the Ocean, cannot by ascending be co-mingled with it, but that the *Northern waters*, do uncestantly rush into a steep place. For it is likely to be true, that, as well in the first mixture of the deep, as in the flood of the generall overflowing, all Waters were once again co-mixt, and that the co-mingling of these, was therefore called Sea. Which waters therefore in the beginning were once salt, and straightway afterwards, were sweeter: it is certain, that those waters have continually flowen downwards, because they are sweet at this day: and so *Scandia* is far higher in Scituation than *Egypt*. But let us imagine onely, earth of ten foot, to have framed a banke to the Sea, in the shoares on every side, and let us keep an equall roundness: at least *Nilus*, which is carried head-long in a straight line from the *South*, into the *Mediterranean Sea*, for a thousand Leagues space, if besides the roundness of the Sphere, which is not any where steep; it also hath it self in manner of a plain, with relation to its Center, it should have onely ten foot fall at the highest, from its rise, even into the Sea. Which is, to call *Nilus* a quiet pool, but not a steep running River. For when a Ditch was devised at *Gandave Bruges*, there was found a declining height of 18 foot, the dimension being taken by night over the flame of a Candle, and that by the withdrawn roundness of the Sphere. If therefore by a slow flowing or running, there is 18 foot of fall or descent in eight Leagues, *Nilus* flowing alike slowly, shall have need of 2230 foot in height at least, in its beginning. But if it shall flow after the manner of *Nilus*, it shall of necessity have need of four times as much at the least: or of nine thousand foot. But if *Nilus* doth measure this height of the Earth by 15 degrees from the *Southern Tropicke* or turning point, unto the *Mediterranean Sea*, where the figure of the Globe is as yet Sphericall or round, the which altitude therefore, is it not lawful to conjecture to be from the Mountains of the Moon, even to the *South*? An unwearied fall of the waters from the *North*, promiseth a notable elevation of the Earth: so it is. But thence it is not granted to collect, that all the waters

- waters (that being supposed) do forsake the *North*; because the Lawes of Scituations are silent, where the water falls down on every side about the Center of the World.
- 15 And so hath been the necessity of the Universe, and the rule of properties. For I feign a sublunary place, without a palpable body: but a flint of an Egge-like form, to fall down from Heaven, and him to rest in his Center: yet shall his length be inclined towards some part of Heaven. What if this be towards the Poles; it will expresse to us the figure of the World. For it hath not therefore lost its auncient weight; yet should it not fall towards Heaven, because that is against the nature of every weight: neither should it fall crooked-wise, seeing that so it should fall into an infinite, and should have no bound of motion, which is alike absurd. Therefore that Stone, with its weightiness, should be stayed in that place wherein it was laid. But since that thing happens not under the Moon, it must needs be, that besides the weight of things, there be some property in place, at the sight whereof it be remooved, and may make the respects of upper and lower. Therefore, if that thing above and beneath, is not but in respect of Bodies, and perhaps onely of sublunary ones, those kindes of respects do wholly subsist, from the intent of the Creator, which is the original cause of all rest and motion. Wherefore if his intent hath been to make the figure of the Universe, Egg-like, (because that was the more commodious *habitation* of *Mortalls*, for the needful nourishments of the heat of the Sun) and hath alwayes made that which is far the best in all things: he hath also limited an Ovall or Egg-like figure to the waters, and the same respect to their Center: Or that the Ovall figure, should keep almost the same intension to the Center, as a round figure hath. What if Fountains do ascend to the tops of
- 16 Mountains; the Water of the Pole might also hold the reason of an ovall Scituation, no otherwise than of a round one: otherwise, if the Heaven, as the adequate or suitable Husband of the Earth, be plainly Spherical or round. 1. It would follow, that the
- 17 Sun makes a greater Circle under the *Equinoctials*, than under the *Tropicks*. 2. The Sun to be so much the swifter moved under the *Equinoctiall*, than under the *Tropick*. 3. The motion of the Sun, to be daily inordinate, and unequall to it self. 4. Houreglasses, which do measure the motion of the Sun in order to slowness; and the pins of Sun-Dialls, which measure motion, in order to the scituation of the Orbe or Circle of
- 18 the *Sun*, should not answer to each other. 5. If those Instruments should agree under the *Equinoctial* lines, they should varie at leastwise, under the *Sol-stices* or *Sun-steads*. Also the Heaven, which is as it were the sheath of the Earth, nigh the Poles, is deeper than under the compass of the Sun; for if Lucifer or the Day-star, being willing to place his seat over the *North*, may be understood to have been guilty of pride: Truly,
- 19 if he were not higher in the same place, that should not be imputed as a signe of arrogancy: especially since in the places, where the holy *Scriptures* were written, the Pole-star hath alwayes seemed very neere to the Horizon, neither doth the Heaven there promise any thing of height, as to sight. But in our Horizon, I have seen the whole
- 20 Body of the *Sun* to have given a shadow on the pin of the Diall, a little after the ninth houre, in the fourth moneth, called *June*: but in the morning I have seen the whole Body of the *Sun* above the Horizon, about the fourth houre: for it did not as yet, cast a shadow, by reason of the thickness of the Air and Vapours. Therefore the shortest night is onely of seven houres at the most: But in the Winter Solstice, the Sun ariseth 15 minutes before the eighth, but sets 27 minutes before the
- 21 fourth. Therefore the shortest day; is at least 7 houres and 42 minutes. But it derogates or takes away from the roundness of the Sphere, to have more of light, than darknes. At length, modern or late made Navigations, have seen the Sun under the North for a moneths space, before that the perfect roundness of the Heaven had suffered that thing.

CHAP. XI.

The Air.

1. The Dreams of the Schooles concerning the moistness of Air.
2. A foolish or unsavory objection.
3. They presuppose impossibilities.
4. The Air is never made Water through a condensing of its parts.
5. They beg the Principle.
6. A ridiculous thing of the Schooles, concerning the motive heat of the Air.
7. The old Wives fiction of an Antiperistasis or compassing about of the contrary.
8. The deep stupidities of the Schooles are discovered.
9. Arguments.
10. Another alike stupidity.
11. That the Air is colder than Snow.
12. An Exhortation of the Authour unto young beginners.

A Mathematicall demonstration, that the Air and Water are primigeniall or first-born Elements, and ever unchangeable, by cold, or heat, into each other.

THE Schooles with their *Aristotle* do hitherto endow the Air with eight degrees; that is, to be most moist; but to be hot unto four degrees, or to a mean: but they give the greatest coldness to the water, with a slack or mean moistness. And so they command the Air to be twice as moist as the water; for that, because the Air by its pressing together and conjoyning, doth generate the water. But I pray you, what other thing is that, than to have sold Dreams for truth? For if the Air be co-thickned, the moisture thereof shall be also more thick, greater, and more palpable in water, than it was before in Air: seeing that condensing cannot make a new essential form, nor is it a principle of generations; what other thing is that, than impertinently to trifle? At least, the water, should not be but Air co-thickned in the moisture, to ten fold, or rather to an hundred fold, and more active, and therefore, and straightway it should moisten more, and stronger, than the Air, by a hundred fold: So far as it, that therefore the water, should be lesse moist than the Air. But if a naked condensing doth dispose the Air to a new form; seeing the same disposition of the inward efficient, is the necessary cause of that thing generated, it must needs be that the same doth remain in the thing produced; and so, if the Air co-thickned, be water, there shall now be but two Elements, to wit, Water and Earth: Whiles the water shall be as moist, as while it was being at first Air, to wit, wherein the condensing alone came, which is a co-uniting of parts, but not a formall transchanging of a thing into a thing. For truly the form every way re-bounding from the moisture of the Air, being condensed into an hundred fold, it shall be even moister, and shall more moisten by an hundred fold, than the ancient Air. But surely, the water doth not moisten by reason of thickness (for otherwise the Earth should, hitherto, more moisten) because moisture onely doth moisten, and not thickness. For else Quick-silver should more moisten the wooll or hand than water. For whatsoever doth more moisten, that it self is also more moist; and on the other hand, whatsoever in an Elementary nature is moister, that likewise doth more moisten. Nature laughs, to require belief of things known by reason of sense; from a Dream, and even till now, to teach the shameful devices of *Aristotle* for truth.

But the Schooles will say, we must thus teach it for a Maxim: That, by reason whereof every thing is such, that thing it self is more such (as though that for the honour of a Maxim, we must belie God!) But the water is not moist but for the Air; therefore the Air ought to be moister than the water. But they shall sweat more than enough, before they will prove the subsumption or second Proposition: but the Air is neither moist nor hot in it self, and whatsoever of moisture there is in it, that is a stranger contained in it, never touching at the nature of Air, although vapours may be contained in the potinesses or hollow places of the Air. For what doth it belong

belong to the nature of Glasse, if it shall inclose water within it? For I shall teach by and by, that it is impossible for Air and water to be changed into each other.

- 3 And so by absurdities, the Schooles do wholly suppose impossible speculations. For it also contains an absurd and impossible thing, that Air condensed, should be made water, and be the perpetual matter of Fountains. For there hath been Air pressed together by some, in an Iron Pipe of one ell, almost the breadth of fifteen fingers, which afterwards in its driving out, hath like a hand-gun discharged with
- 4 Gunpowder, sent a Bullet thorow a Board or Plank. Which thing verily could not be done, if the air by pressing together, might by force, be brought into water. Especially, because that experiment did no lesse succeed in the deepest cold of winter, than in the heat of Summer. What if therefore the Air being pressed together by force in a Pipe, and cold season, be not changed into water; by what authority shall the Schooles confirm their fictions, touching the co-thickning of the Air, for the springing up or over-flowing, and the continuance of Fountains? For Cold hath not the Beginnings, Causes, and properties of generating, in nature. Yea, no moysture at all is found in the aforesaid Pipe; and moreover, wet Leather in the end of a Hand-Pistoll, drieth presently.

- 5 It is also a ridiculous thing to prove the Air to be moyst by the original of Fountains: and likewise to prove the rise of Fountains from the supposed moysture of the Air. Both Arguments of the Schooles is from the scarcity of truth, and a childish begging of the Principle. And that they may adorn the four Elements with qualities, they attribute to every one, one, the highest quality, but another, a slack one, and the Schooles command nature to obey their fictions.

- 6 Therefore they say, that the Air is slackly hot; because they will have it neer to the feigned Element of fire: that is, or because it borroweth that slack quality of its Neighbour: and it changeth its proper and native disposure, at the pleasure of its Neighbour; and that impertinently, while the speech is of native properties. Or because it hath that quality of its own disposition, and although slack, therefore notwithstanding, it shall also have such a Neighbour, which thing is alike impertinent and naught.
- 7 And that they may prove the moderate heat of the Air, they carry on the like foolish invention of an *Antiperistasis* or a compassing about of the contrary. To wit, that the Air in its uppermost part is hot by reason of a nearness of the fire (and so they feign, not an essential heat, but a begged and improper one by accident) and that nigh the Earth it is likewise hot, from the reflexion of the Sun-beams. Which heat is for a little space, a stranger by accident, and therefore a feigned property of the Air. But they will have the middle Region of the Air to be wonderful cold, by reason of an *Antiperistasis*: To wit, because both parts of the hot air doth compass it about. Whose like, they say doth happen to deep wells, they being cold in Summer, and luke-warm all the Winter.

- 8 But I wonder at the deep or profound benumbednesses of the Schooles, and the drowsie distemper of the auncients. 1. Because from this their whole Structure, it appeareth, that the air is generally cold, but not meanly hot. 2. For truly the fire is not an Element in nature, and much lesse is it under the hollow of the Moon, neither therefore can it make hot the uppermost part of the Air, except by a Dream. 3. For if the Air be hot by it self, and of its Elementary property: then is it alwayes and every where hot, even in deep Wells. 4. But if it be hot through any other thing proper or familiar unto it, which makes it hot: then besides that it should have something besides it self mixt with it, from whence the Elementary simplicity of its own Body should cease, it should also alwayes and every where actually be hot; or lastly, should be hot by reason of something applied to it, acting by accident. Which thing is impertinent, as often as the thing to be proved, is taken as concerning essential things. Therefore if the Air be not by it self hot, it must needs be cold by it self. Since those two do subsequently exclude each other in nature. 5. If the fire be never cold or moyst, and the water be never dry: so the Air can never be lesser than intensively or most moyst, and slackly hot, if the Schooles speak truth. 6. They would have that to be the middle Region of the Air, which is scarce distant half a mile from us, being unmindeful of their own Doctrine. To wit, that the Diameter of the Air, exceeds the Diameter of the Water ten fold: but that this is greater than the Diameter of the Earth two fold: which fiction being granted, the Semi-diameter of the Air should be deeper than 570000 miles.

Therefore

Therefore half a mile should be as nothing in respect of the middle Air. Oh ye Schooles, I pray you awake! For if the Air should of its own accord, and of its own nature be hot, by what cause at length should it be cold in its middle part? For is it because its Neighbour on both sides is hot? But then the Air would not propose to it self wrathfulness, but rather joy, from the agreeableness of its neere nature. For why doth the Air put off its natural property, because it did on both sides touch the luke-warm Air, agreeable to it self? For how shall luke-warm powred on luke-warm, wax cold, because it doth finde luke-warmness on both sides? Or if cold be placed between two Colds, shall it therefore wax hot in its middle? I cannot sufficiently wonder at the unpolished rudeness of the Schooles, who deliver the Doctrine of *Antiperistasis*, which desireth so great credulity, not judgement. For although that fiction should please us, while the Air is hot about the Earth; but certainly it could by no means, in the Winter seasons. For truly, neither then indeed is that middle Region of the Air adorned with a native heat. 9. It is a wonder I say, that such absurd falsehood and Doctrine hath not yet breathed out of the Alps. And so hence it is manifest, that the *Peripateticks* do even from a study of obstinacy teach known falsehoods, least they should not swear in the words of *Aristotle*: or that no judgement at all is left them, that they may ingeniously perform their office: and that they may think they have done enough, if they follow the herds of those that went before them. Therefore *Antiperistasis* is a dream of his, who when he knew not the least thing in nature; yet would seem to have known all things, and to be worshipped for a Standard-defender by the Schooles his followers. But because *Aristotle* fleeth to the heat of Wells in Winter, for the demonstration of an *Antiperistasis*, that shall straightway fall to the ground, through the instrument whereby we measure the just temperature of the encompassing Air: Wherein we see by handicraft-demonstration, that the Air in deep Wells and Cellars is stable in the same point of heat, whether it shall please us to measure it in Winter, or lastly in the greatest heats of Summer. 10. But it being granted, that there were not an equall temperature in Wells: but yet surely it would be a foolish thing, for the Air otherwise, naturally, moderately hot, sometimes to be cold, sometimes again to be hot, as it were through despight, by reason of the applied alteration of the encompassing air. 11. The holy Scriptures declare the Snow to be colder than the water (because Snow is water, in which the utmost power of cold is imprinted) and the Air to exceed the Snow in coldness: hence it is read; *He that spreads abroad the Snow and the Wooll, that the wheat may be kept safe under the Snow, from the cruelty of the cold Air*: as it were under a woolly Covering. For we see by handicraft operation, that a member almost frozen together, waxeth hot again under the Snow, and is preserved from putrification or blasting; because else the Air would straightway proceed wholly to congeal it; or if it be suddenly brought to the fire, it dieth by reason of the hasty action of another extream. Therefore this is to have gone thorow [meanes] if it be to go from the cold air, thorow Snow, water, and then into a slack luke-warmness. Therefore Snow is lesse cold than air. 12. But why, to the moistness of the water, do they implore its thickness for moistening (which is a ridiculous thing) doth it not assume the same thickness of water, even by reason of cold? For so they had at least spoken something likely to be true.

Give heed therefore whosoever thou art, that endeavourest by healing to work out the salvation of thy Soul, what a Patron the Schooles do hitherto defend. By what counsel have they made the Elements, Complexions, and degrees of qualities, the foundation of healing; who being seduced not but by a sleepey credulity, have yielded the number, essence, use, properties, fruits, and passions of the Elements, and their own names to heathenish blindness. Behold how slavishly the Schooles have borrowed their Elementary qualities, and would have them be obedient at the pleasures of Dreams; they have coupled, increased, blunted or repressed, and divided them; they have even sent abroad as it were wan devises for the causes of natural things, knowings of Diseases, healings, and destructions of the Temples of the holy Spirit.

Therefore the air, water and earth are cold by Creation, because without light, heat, and the partaking of life. Heat therefore is a stranger to them, external to the Elementary Root. But the air and earth are by themselves, dry: the water onely, is moist. These are the qualities of those Bodies, which none may vary as it listeth him.

him. But the air hath emptinesse (as in its place elsewhere) whereby it drinks up and withholds vapours. This is the state, order, Complexion of the Elements. And which belongs not to the profession of Medicine, unless by the way. And so I will shew, that in the Schooles, that which least belongeth, hath been very much searched into, as if it were of the greatest moment, and that which is of the greatest moment hath been hitherto neglected. Because the whole pains of Physitians hath given place to mockeries, and unprofitable brawlings.

- 11 Therefore if the Elements do not enter into mixt Bodies, vain is the Doctrine of the Schooles touching the number, composition, temperaments, concerning the contrariety, proportion, strife, and degree of Elements: for degrees are bound to the Seedes of simple Bodies; not to an Element. They are vain trifles, whether the forms of the Elements do remain in the thing mixt? because they are those things which are not in it, as an Element: it never ceaseth from that which it once began to be, except the water; to wit, when being espoused to the Seeds, it departs into a Body, which hath hitherto been believed to be mixt. Vain therefore is their fight, interchangeable course, Victory: and that hence, every Disease, dissolution, ruine, healing, and restoring, doth depend. Vain also is the method which is framed by contraries fetched from hence. For the Schooles being by degrees guilty of those ill patched lies, however they may a long time prate concerning Complexions, at length they fail, and being contented with feigned humours, they scarce any more do debate concerning the fight of the Elements, except in the six things besides nature, and the frivolous Commands of Diet.

1. *The Air and Water, are Bodies not to be changed into each other.*

- Although I have plainly shewen in the presence of many, that Heer, in his Apologie or defence against my little Book concerning the Fountains of the Spaw, had impertinently made use of my Instrument: yet he hath not been wanting to mingle me with his stupidities or sottishnesses. For he saith, that I would set forth a continual motion. Neither indeed hath he known, that in that, he hath contradicted himself. For the motion ceaseth in the Instrument, after that the water hath ascended or descended, according to the temperament of the air encompassing it. For neither can that motion be any more called perpetual, than the vane of a Temple appointed for the changing of the winds. Therefore Heer hath discovered, that he knows not what perpetual motion is. For I had divulged my Instrument, that according to my Doctrine of the Fountains of the Spaw, I might prove that the air did sustain its common rarefaction or making thin, and compression or co-thickning, without the changing of its Element. For Heer saith, that the Spirit of Vitrioll hath pierced the substance of Glasse; which thing, none will grant, who have known that far more subtile Liquors are preserved even in the fire. Neither hath it helped him, that I had affirmed to him, that Clavius in the Colledge of the *Romane Society*, had shut up water in a Glasse of this Figure, 60 years before, whereof not the least drop had perished. That which the line there signified by a Diamond sheweth. But Heer boasted amongst *Idiots*, that he had sometimes been a Professour of the *Mathematicks* at *Padua*. Wherefore I would demonstrate in paper, his every way ignorance of the *Mathematicks*. But he was made in my presence dumb. But thus have I proceeded to demonstration. For the figure of the Glasse being delineated, in which *A* and *D* are the two Spheres filled with air. But *A*, and that the upper Sphere, is outwardly shut on every side. But *D* is the inferiour Globe open in the end of the Channel or Pipe *F*. But *A* and *D* by one onely Glasse, are conjoynd by the Channel *B. C. E.* in which is the liquor of Vitrioll, the which, I had said to Heer demanding of me, was made red by the steeping of Roses, that it might be the more visible, that it did not putrishe through continuance. Therefore let that red Liquor be, *B. C.* upon this figure: therefore I have framed this Probleme or hard Question. The Liquor *B. C.* cannot move it self through the temperament of the encompassing air in the Channel, unless one of the Globes be open, but the other shut. The explaining of the thing granted. Let the Glasse with the Liquor, be as is above described. The explaining

plaining of the thing required. We must shew, That the Liquor *B. C.* cannot be moved in the Pipe by the temperament of the encompassing air, without the opening of *F.* The preparing of the demonstration. It is very great, because the air suffers enlarging, and heaping together or straightning, according to the qualities of heat and cold, and because the just extension of quantity is not had in the air, unless when it is temperate.

The Demonstration. The air which is in *A* being made thin by the heat of that which encompasseth it, increaseth by the increase of dimensions, and therefore it takes up more room than before. Which thing notwithstanding cannot be, unless it drives the Liquor *B. C.* into *C. E.* (otherwise a poriness or fulness of little holes of the Vessel should be admitted, or a Rupture of *A.* Which contradicteth the supposition of *Heer*) and successively the air which was in *C. E.* into the Vessel *D.* But *D.* cannot receive that air, unless it drive away so much air through the hole of the Pipe *F.*

The Conclusion. Therefore without the opening in *F.* the Liquor *B. C.* had not been moved from its place. Therefore it is no wonder, that the Liquor of Vitrioll hath by little and little exhaled of its own accord, through the necessary opening in *F.* Therefore the stupidity or dulness of *N.* is laid open; to whom, when I had given many Instruments of like sort, yet he had never observed the opening in *F.* Yea although I had plainly shewen these things to him (many being present) before that he had set forth his ridiculous fable against me; yet he feigned afterwards that he wondred: Because that Liquor had perished by degrees. He saith, that he found the whole Vessel most perfectly shut (for neither doth that which is not exactly shut deserve to be called shut) yet he grants that a motion of the Liquor was made, which had shewen the temperature of the air. And that the Liquor was changed into air, the Glasse being shut. Therefore false observations being supposed, I will discover his misfortunes.

It being granted, that the Vessel *D.* is as equally shut, as is the Vessel *A*, according to his supposition. The thing required we must demonstrate. That the water *B. C.* cannot be moved. Likewise that it cannot teach the temperature of the air; also that it could not be dried up or exhale. Likewise that it could not be turned into air. The preparing of an absurdity. For if he admitteth of the motion and dryness of the water, he ought to admit absurdities and contradictories, or to confess his errors. The preparing of the demonstration. Let some heat be applied to the Vessel *A.* exceeding the temperature of the air encompassing: for then the air included will enlarge it self, according to the more or lesse heat, and according to, and as it exceedeth the true temperature of the air shut up in the Vessel *D.* against which, it driving forward the water *B. C.* it shall destroy the equall tenour through too much action. So that the air shall be pressed together, and co-thickned by restraint, that it may yield to the enlargement made in *A.*

The Demonstration. Therefore according to the supposition of *Heer* (that air pressed together is turned into water) the Liquor had never failed in the Vessel. Yet his own observation will have it: that the Glasse being on every side exactly shut, the water was nevertheless dried up and made air. But he cannot admit of dryness in a Glasse exactly shut, unless his own supposition be destroyed (to wit, that air pressed together is changed into water) neither again can that supposition subsist, unless he shall admit of the continuance of the Liquor; which notwithstanding doth contradict his own observation. Likewise he cannot admit of the moving of the Liquor *B. C.* unless he shall grant the Glasse to be opened in *F.* and by consequence he confesseth, he hath erred in his observation. And which thing, although by the force of demonstrations, he was constrained to confess, before that he vomited forth his Apologie with all kinde of reproaches against me, yet he hath persisted therein, to discover his own ignorances.

The Conclusion. Therefore it must needs be, if the water *B. C.* be moved through some temperature of the air, that both the Vessels *A* and *D.* are not shut. For else the Instrument should not be convenient for measuring of the temperature of the air (which is contrary to his supposition) for seeing the air is of the same heat about *A.* and about *D.* the Liquor *B. C.* shall also necessarily take rest. Because the quality of the air which encompasseth, is the moving cause of the water *B. C.* acting with an equall strength, and giving an equall tenour. Now through the supposition of that which is false, I will demonstrate, what may follow upon his ignorance.

rance. Let I say the water *B. C.* according to his observation, be changed into air. In the first place, this observation cannot be admitted, without raretying, caused by heat. Nor can that raretying be granted, without an increase of place, beside the heat. And the increase of place cannot subsist without the enlarging or breaking of the Vessel. Because he confesseth the Glasse to be exactly shut, with a continuation of the Glasse, without ruine, or poriness. 2. A transchanging of the water into air cannot be granted, without co-thickning and restraining; and restraint is not given without the addition of parts, by pressing together, actually within the same space or magnitude. Which ought altogether to be named a condensing of the air, which in this place, cannot be made but by cold alone; which supposeth the air to turn into water; therefore not the water into air. Since therefore neither heat, nor cold, can turn water into air, much lesse shall that which is temperate do that. For that, this doth not beget an alteration in those Elements. Likewise air is not turned into water, because this conversion cannot be admitted, being made by rarefaction, because the rarefying of the air doth not happen in this place without the mediation of heat. But *Heer* will have it, that the air is co-thickned into water by cold. Therefore water shall not be generated of air by heat. 2. That transchanging of air into water, cannot be admitted, but by condensing and restraining, which cannot happen in a Glasse perfectly shut, but by cold. Which agent upon the air being shut up within *A* and *D*, should change it into water, according to the supposition of *Heer*. For so water, had been increased by generation, in Vessels perfectly shut. Which contradicteth his own words. This pretious Liquor perished, it is no more, it hath ceased to be, and that indeed in the raging winter. Therefore, since neither heat nor cold can co-thicken air into water: much lesse shall that do it which is temperate. Therefore never. It is a wonder therefore, why it hath not hindered the drying up of the Liquor in Vessels. Since according to his own prattle, those should be onely buried under the Snow, that they might be filled with water. Now there shall not hereafter be need of rain, if the Cave being perfectly shut and cold, continual Cisterns should be made. And likewise, when the water should over-weigh the air, that water shall fall into the bottom of a great Vessel very closely shut, from whence, as oft as one would list, the water should be drawn out. And so that Vessel should be changed into a winter Fountain. For as *Heer* saith, The Vessel was very closely shut, it wanted little holes, neither had it need of opening, as well for the entrance, as the transpiration of the air. But if a new air might afterwards enter the same way, and by the same meanes, whereby the water that was changed into air, the Glasse being shut, flew out: Hereafter therefore, sweet water shall not be wanting to Marriners in a Ship, if by the cold of the night, the air growes together by drops into water. *Venice* and *Antwerp*, shall frame Fountains in the belly of a Brasse Cock, which in the Pinacle of the Temple sheweth the windes. For by the night-cold, the air shall weep, being turned into water. And although the Pipe be moist to those that play on Flutes; that is not from the air: Otherwise Organ-Pipes also should be moist within, which is false. For the air utters the sound or tune, and the salt vapour, drops water out of the Pipe. They having pressed air of one ell, together, in a gun, to the space of 14 fingers, even in the cold of winter: and so far is it, that the air so pressed together in excelling cold, was changed into water; that it cast out a leaden Bullet thorow an Oken Plank, more strongly than a hand-Gun or Pistoller. Now I will proceed to prove that thing by positive Reasons. Because an applied esteem or thinking, hath on every side overshadowed the Schooles with a manifold absurdity.

CHAP. XI.

The Essay of a Meteor.

1. A vapour raised from the heat of water differs from that which is made by cold.
2. That Air is not made of water.
3. That air can neither by art or nature be brought into water.
4. That the Air doth not subsist without an actuall vacuum or emptiness.
5. It is proved by Handicraft operation, that the subtilizing or rarefying of Art, however exact or fine it be, is nothing but a sifting.
6. By handy operation the same thing is shewen in the sifting or making of leaf-Gold.
7. The water is examined by three proportionable things, and the Doctrine of necessity in the highest degrees of cold of the middle Region of the Air is delivered.
8. The likeness of Mercury with water.
9. The nature of Mercury.
10. The rashness of antient Chymists, concerning Mercury.
11. That earth and water are never made one thing by any co-mixture.
12. How art exceeds nature.
13. The Earth is properly the fruit of the two primary Elements.
14. A neerer Reason of an incapacity in Mercury, of being destroyed.
15. Aquæ fortes do not operate upon the Center of Mercury.
16. Nor the Spirit of Sea-salt, upon the body of it.
17. The inward Sulphur of Mercury.
18. How water may give a weight more weighty than it self.
19. After what manner there is an ordinary piercing of Bodies in the way of nature.
20. In the way of nature, there are not the three first things, although in its own simpleness there is a conceivable difference of kinde, which is to receive the Seedes.
21. Smoak is meer water.
22. Why clouds do stink.
23. What the Dew is.
24. What a mist is.
25. Wherefore it behooved the Air in the middle Region of the Air to be cold.
26. In this cold, all seeds separated by Atomes or Motes, do die, and therefore the water returns into the simplicity of its own Element: but in Earth and Water, if things are spoiled of their seed, they do not return unto that simplicity: but do conceive a new seed.
27. By Handicraft operation the error of Paracelsus is laid open.
28. The error of the Galenists about the savours of things Elementated.
29. What the Gas of the water is.
30. The unconstancy of Paracelsus concerning the separation of Elements from Elements.

IT is already sufficiently manifest, that the water by the force of heat, is lifted up in manner of a vapour, which vapour nevertheless, is nothing but water made thin, and remains as before; and therefore being retorted or struck back by an Alembick, it returns into its ancient weight of water. Yet it may be doubted, whether water consumed by the cold of the air, is not changed into the nature and properties of air. Because after the flood, the Almighty sent the windes, that they might dry the face of the Earth. And even unto this day, water is sooner supt up under the most cold North, than in Summer heats. Also a Fountain falling into a place or Vessel of Stone or Marble, under the most chilled cold, with a continuall Gulf, the motion of the steep falling Fountain, hinders indeed the water from congealing; yet a certain vapour is seen to ascend, which being straightway invisible, is snatched away in the Air.

That which is presupposed, is, that the every way nature of air, is at least, consumed by cold, if not by heat. First of all I answer; that absurdity being granted, the Schooles in the first place, have not any thing for themselves from thence, that therefore, the air, by it self, should be moyst: so far is it that the air (as they determine) should be far moyster than the water. Because it is at least, water dried up. For that which is transchanged, doth alwayes loose the properties which it had in the terme of

or bound [from which] and borroweth the qualities of the thing transchanging. For however, either the whole air was sometimes water, or that onely should be moyst, which was born of water: but the other first-born air, should be dry from its Creation. And so there should be two aires essentially different. But that the air in its own purity, is dry by an inward property, it appeares from the objection of the aforefaid cold: because if the air from its Root were moyst, windes had not been sent to dry the Earth. But if indeed through the windes, the waters of the flood were truly changed into air, there should be much more air after the flood than before. Consequently, either some part of the World had been empty, or certainly, now by reason of a pressing together, and thickning caused by a new air of so great an heap, we should be choaked (which thing shall hereafter be manifested, by the handicraft operation of a Candle) or an equall part of air ought successively to had been annihilated or brought to nothing, under the generation of so great a new air. For the Text will have it, that so deep waters, and the whole superficies of the Earth also, was dried by the windes. Or if before the flood, the waters had been air in the flood-gates of Heaven; in like manner therefore in the whole flood, there had been an emptiness in those flood-gates of Heaven: to wit, if the water be thicker and more condensed by a hundred fold at least, than the air.

3 Therefore, I lay it down for a position, That the water doth never perish, indeed not through cold, or that it can be changed, by any endeavours of nature or art; and likewise, that the air in no ages, or by no dispositions (not so much as in one onely small drop) can be reduced into water. For the water doth not endure an emptiness, as neither the co-pressing of it self, in being pressed together by any moover. Onely it is pressed together in a seminall in-thickning, through a formal transchanging of it self.

4 But on the contrary, the air cannot subsist without a *Vacuum* or emptiness; (which thing I will prove in its Chapter) and therefore it suffers an enlarging and straightning of it self. Therefore there are two stable Elements, differing in nature and properties among themselves; because it is impossible for them to be changed into each other. I confesse indeed, that out of the Stone-Vessel of a Fountain, a watery exhalation doth ascend like a mist, from the smallest Atomes of the water; which exhalation, although departing but a little from thence, it be made altogether invisible, it doth not therefore corrupt the Doctrine delivered. For truly of one equall agent, there is one onely, and equall action. Wherefore, if cold doth first change the water into an icy exhalation, the same cold cannot afterwards have another action upon that exhalation, than of more extenuating and dispersing the same; so as that through its fineness, it may soon be made invisible; And afterwards may be made more and more fine. For neither could the hundredth extenuation of the same exhalation, more transchange the water, than the first. Because it is an Element and Body, impossible, by its appointment, to be reduced into a greater simplicity: since subtilizing made by the division of parts, is nothing but a certain simple shifting. For example, Beat Gold into Plates, and then into the thinnest leaves, but thence into the Gold of Painters; straightway again, make it smooth or plain, in a Marble Morter. And then with *minium* or red Lead, and Salt, bring it into an impalpable, or exceeding fine Powder; seperate the *minium* by the fire, and wash away the Salt with water, and repeat or renew it often as thou listest: At length, also with *Sal armoniac*, *Stibium*, and *Mercurie Sublimate*, drive it through a retort; and renew that seven times, that the whole Gold may be brought into the form of a flitting Oil of a light red colour. For it is a very smooth, yea and a hard, sound; that which may be hammered, and a most fixed Body, which now seemeth to be turned into the nature of an Oil. But truly that dissembled Liquor, is easily reduced into its former weight and body of Gold. What if therefore Gold doth not change its antient nature, by so many manglings; nor doth by any meanes loose its own seed; much lesse doth water, a thing appointed for a simple Element by the Lord of things, for the upholding of the Universe. Although water should be potent in the three divulged Beginnings, and should truly consist in Salt, Sulphur, and Mercurie, mingled together: yet it suffers no separation of the same things, by reason of the most exquisite simpleness of its nature, and the most firm continuance of its constancy. For Bodies when they are made subtile or fine to the utmost, that they could be no more fine; if they should continue in making them fine, at length they depart into another substance; with a retaining of their seminall properties. And in this

this respect, the Alkahest of *Paracelsus*, by piercing all Bodies of nature, trans-
 changeth them by making them subtile. Which happens not in the Elements, Wa-
 ter and Air; because, by reason of their highest simplicity, and priority of their ap-
 pointment, they refuse to passe, or to be transchanged into any thing that is before, or
 more simple than themselves. Therefore when exhalations being gotten with child
 by the odours or smells, and seeds of compound Bodies, are translated from the lower
 parts to the middle Region of the air: there, through the most subtile dividing of
 the vapours by cold, as much as is possible for nature to do, they are reduced indeed,
 into their most simple and primitive purity of Elementary water: but in that last
 sub-division of their finenesses and Atomes, all Seeds, Odours, and Ferments, which
 they lifted upward with themselves, do dye together, and do return into their first
 Element of water whence they were materially formed. Hence Clowdes, as long
 as they are Clowdes, do sink in Mountains: but not after they are by the greatest
 colds, there extenuated into the last division of fineness. And this necessity hath
 been in nature, that the middle Region of the air should (not far of from us) be
 most cold. For therefore the water alwayes remains whole as it is, or without any
 dividing of the three beginnings, it is transformed and goes into fruits, whither the
 Seedes do call and withdraw it. Because an artificial diligent search hath shewen me
 indeed, after what sort, the three first beginnings, and that in a proportionable sense,
 are in the water, yet by no art, or corruption of dayes, are they to be divided from
 each other. For an Element should cease to be a simple body, if it be to be seperated
 into any thing before, or more simple than it self. But, nothing in corporeall things
 is granted to be before, or more simple than an Element.

The water therefore, is most like to the internall Mercurie of Mettalls; the which,
 seeing it is now stript of all manner of spot of Mettalick Sulfur, it as well cleaves to
 it self on every side, by an undissolvable joyning, as it doth radically refuse all possi-
 ble division by art or nature. Hence *Geber* had occasion given him to say, that there
 is no moysture in the order or course of things, like to *Mercury*, by reason of the Ho-
 mogeneall or samely kinde of simplicity continually remaining with it in the tor-
 ment of the fire. For truly either it being wholly changed in its own nature, flees
 away from the fire; or it wholly perseveres in the fire through the transchanging
 of its seedes. I confesse indeed that I learned the nature of the Element of water, no
 otherwise than under the Ferule or Staffe made of the white wand of *Mercury*. But
 since I have from hence, with great pains and cost, thorowly searched for thirty
 whole years, and I have found out the adequate or suitable Mercurie of the water; I
 will therefore endeavour to explain its nature, so far as the present speech requireth,
 and the slendereness of my judgement suffereth.

First of all, the Alchymists do confesse, that the substance of *Mercurie* is not at all
 capable to endure any intrinsecall or inward division, and they shew the cause: be-
 cause by a homogeneall and sweet proportion, its watery parts, are by an equall tem-
 pering conjoyned to its earthly parts (the airy and fiery ones, being suppressed in
 silence, for that these should flee away, if they were in it, neither do they contain
 the cause of constancy here required) and therefore that both these cannot forsake
 each other, by reason of their just temperature, they embracing each other, though
 against the fires will.

In the first place, the error of the auntients hath deluded them, concerning the
 necessary confluence of four Elements into the mixture of mixt bodies. But surely,
 that error was not to be indulged by *Alchymists*: because they are those, who
 durst not enforce or comprise the air and fire of *Mercurie*, when as they treated of its
 constancy. And then, because it was very easie for them to experience, that the wa-
 ter, after what manner soever, either by art, or natural proportion, it was married
 to the Earth, yet that it never obtains a constancy in the fire, as neither to be at any
 time truly radically joyned to the Earth: Because water, after what manner soever
 it be co-mixed with Earth, ceaseth not to be water. For neither shall manner or pro-
 portion ever make water to degenerate from its own essence, as neither shall any
 conjoyning of it with Earth, be able to procure that thing. But water remaining
 water, is born, alwayes to flee away from the fire. Surely it is a ridiculous thing, that
 the water should rather love a proportioned weight of Earth, than an unequall one,
 and that, for that loves sake, it should against its will, the rather forsake that tempe-
 rament of Earth. For truly when the speech is concerning the co-mingling of four
 Elements, it is understood of pure Elements, and those plainly unmixed together,
 and

and so not defiled, with any spot of mixture, or otherwise prevented by any disposition. For neither doth the water carry a ballance with it, nor beares a respect as to weigh the Earth that is to be co-mixed with it, that it may be the more toughly conjoynted to the same. I greatly admire, that the wan errour of the co-mixing of Elements being received, hath brought forth such fortish absurdities among all the Schooles, and that they by that absurdity alone, have locked the gate of finding out of Sciences and Causes. *Mercurie* doth not indeed admit into it, or contain so much as the least of earth, which is alwayes the Son of water alone. Yea earth and water can never be compelled into any naturall body, or be subdued into an identity or sameliness of forme, by whatever skill that thing be attempted: For Tiles or Bricks, if from moyst Earth they are boiled into a shelly stone, they do not receive water, but for the guidance of the Clay: but earth hath a seed in its own Salt, whence the Clay becomes stony through the coction of Glasse-making. Therefore of the water and earth, there is onely a powring on, and applying of parts; but not an admixture of growing together. For whatsoever is meet to depart into a compounded Body, and of divers things, to be converted into [this something] this must needs be done by the endeavour of the working Spirits, and so far, of those things that do contain them, as they do promote the matter by transchanging it into a new generation. But the Elements are Bodies, but not spirits, and much lesse do they also ast into each other. The Earth therefore, ought first to loose its Being, and be reduced into a juyce, before it should marry the water, that by embracing this water gotten with childe by the seed, it might bring it over into the fruit ordained for the conceived seed. But what agent should that be, which should transport the earth into a juyce, and not rather into water? Since the earth being a simple body, should be changed into nothing but into a simple body its neighbour? Surely another co-like Element should not cause that; seeing nothing of like sort, hath been hitherto seen to agree with the water or air. Nor, at length, should the earth intend the corruption of it self, since this resisteth the constancy of Creation. Therefore although part of the earth may be homogeneally or by way of simplicity of kinde, reduced into water by art; yet by nature onely, I deny that thing to be done: seeing that, in nature, an agent is wanting, by which agent alone, onely mediating, the Virgin-earth, or true earth, is reduced into Salt, and from thence into water.

12 Let it be for a Lesson to Chymists; That the Earth, although it was in its first constitution, created, yet properly it is even a fruit of the water. Therefore neither do generations or co-mixtures ever happen in nature, but by a getting of the water with childe. And so that as long as the water is chief in the seed, never any generation proceedeth from thence. Therefore much lesse, is there a flowing compound body to be expected from thence; because it resisteth the fruitfulness of the fire. And that thing least of all, as oft as water and earth are mutually connexed to their own bodies. Therefore the constancy of bodies is onely in the fire, in the family of Mineralls, and indeed most perfect in the purest Mettalls. Because the Eternall, hath not created moysture to be likened in its constancy, to metallick *Mercurie*. And therefore there is in *Mercurie* it self, even as in the Elements, a near reason of an incapacity to be destroyed. For truly I have discerned in *Mercurie*, a certain outward Sulphur, containing the originall spot of Metall; the which, because it is originall, therefore is it also taken away from it, with difficulty. Which at length, nevertheless, being seperated by art, skilful men say, that the *Mercurie* is cleansed of a superfluous Sulphur, and superfluous moysture. Because afterwards, it may not by any fire be precipitated or cast into the form of Earth, by reason of its greatest simpleness, whereby it is compared to the Element of water. For it hath lost its earth, that is its *Sulphur*, which earth in the center of its essence, is no less from the Element of water, than its remaining refined *Mercurie*, which earth, albeit, it had from its first beginning most deeply co-mixed with it self. If therefore the *Mercury* in its former state, had a suitable temperament of earth and water: therefore at leastwise, after the taking away of that Sulphurous earth, it had lost its antient incapacity of being divided, the which rather, by a contrary disposition of relation, it hath hence-forward confirmed far more firm to it self for ever. For *Mercurie*, after it is spoiled of that Sulphur, is found not to be changed by any fire: because it is the *Mercurie* of *Mercurie*. But the Sulphur is death and life, or the dwelling place of life in things: to wit, in the Sulphur, are the Ferments or leavens, putrifactions by continuance, odours, specificall favours of the feedes, for any kinde of transmutations. The *Mercurie* therefore being

ing cleansed of its originall spot, and being a Virgin, doth not suffer it self to be any more laid hold on by Sulphurs or seeds; but it straight-way consumeth, and as it were slayeth these, except its own compeere. For other sublunary bodies, are to weak, that they should subdue, pierce, change, or defile *Mercurie* of so great worth: Even as it well happens in other bodies, where the seed which lurketh in the Sulphur, sends it self into water. But the Salt and *Mercurie* of things, as it were womanish juyces, do follow the conceptions of the Sulphur.

For *Aqua fortis* is not wrought upon Mettalls, or *Mercurie*, but by the beholding of the Sulphur. For the spirit of Sea-salt, without the conjoyning of some embryonated or imperfect shaped Sulphur, doth not therefore so much as dissolve the common peoples *Mercurie*. Therefore the Sulphur onely is by adjuncts immediately dissolved, and changed by the fire; which successive change, the other parts of the compounded body do afterwards undergoe, not but for the Sulphurs sake. Therefore *Mercurie* of *Mercurie*, or in *Mercurie*, remaineth safe, as well in fires as in its Liquor the air. Otherwise, if a Corrosive matter should touch on that *Mercurie*, the pains of many might happily be recompenced: Because the whole Root of transmutations is in the Sulphur.

Therefore there is another Sulphur of Mettalls, internall to *Mercurie* it self, and therefore it remains untouched by every corrosive thing, no lesse, than from the destructions of fire and air. Yea a totall ruine of things should follow, if every thing dissolving should pierce into the innermost Root of dissolving. And although Silver dissolved in *Aqua fortis* may seem to have perished, as being in the form of a water; yet it remains in its former essence: Even as Salt dissolved in water, is, remaineth Salt, and is fetched from thence, without the changing of the Salt. Which thing surely should not thus come to passe, if the thing dissolving, should in the least be joyaed in dissolving, and should not be stayed by the *Mercurie* of that composed body. Therefore the inward kernel of the *Mercurie*, is not touched by dissolvers, and much lesse is it pierced by them.

But the ignorant being astonished at the novelty of the Paradox, will urge: If the water be not pressed together, nor its parts go to ruine, and Gold be of water alone, whence therefore have Gold or Lead their weight? For truly, water hath not pores, bigger by ten fold than the whole water. In the first place, as this doubt doth not take away doubts, so it argues nothing against the matter of Gold, to be taken from water onely. For truly, if Gold should be of four proportioned Elements: and air and fire are light ones: I therefore may likewise object, from whence hath Gold its weight? But if it consist onely of Earth and water, from whence hath Gold its ten fold weight? Therefore an argument which of it self doth not drive away difficulties, doth nothing presse the adversaries. But since it behooves an Interpreter of nature to be ready to search into, and render the causes of nature; I will shew from the premises, that the seed of Gold hath a power of transchanging the water into [this something] which is far different from water. Wherefore it is agreeable to nature and reason, that in transmutation, the water doth sustain as much pressing together, going to ruine, and aduniting, as great Stones or Mettalls do overpower the water in weight, and as much as the necessity of the seed doth require: Because that, of nothing, nothing is made. Therefore weight is made of another body weighing even so much; in which there is made a transmutation as of the matter, so also of the whole essence. Therefore the water, while it undergoes the lawes of the seed, it is also bound to the precepts of the dimensions of its own weight, co-thickning, and going to ruine. For if the water of its own accord flies up, outflies the sight, in the shew of a vapour a hundred fold lighter than it self, and yet remains water; why shall not the water, while it is made, [this something] neither is any longer formally water, also receive thicknesse greater than it is wont, by ten fold? for indeed on both sides, the matter doth follow the properties of the seedes. Therefore the liberty of nature is perpetuall, of its own accord, to cause, and to suffer the pressings together of a watery body, and will not undergoe those by any guidance of an Artificer; yea Mountains are sooner overturned by Gun-powder. Therefore there shall be sixteen parts of water pressed together into the room of one part, where Gold is framed of water.

Wherefore, so far is it, that the piercing of dimensions becomes impossible, seeing that nothing is more natural or home-bred to nature, than to co-thicken the body of the water: but indeed, although there may something appear in the water like

to the three first things, yet also there is no hope that they should be rent asunder from each other, because in the every way simplicity of the water, an adequate or suitable Sulphur is after a certain sort hidden, which cannot be separated from the other two, but they all do accompany together. Those are not the three true Principles, which are abstracted or separated onely by the Imagination. The water therefore, since it doth on every side vary off-Springs according to the diversity of their feedes; thus so many kindes of Earths, Mineralls, Salts, Liquors, Stones, Plants, living Creatures, and Meteors, do rise up in their particular kindes, from the blast or inspiration of the feedes. For the water putrifies by continuance, in the Earth, is made the juyce of the Earth, Gums, Oyl, Rosin, Wood, Berries, &c. and that which of late, was nothing but water materially, now burns, and sends forth a fume or smoak.

21 Not indeed, that that fume is air, but is either a vapour, or a drie exhalation, and a new fruit of the water, not yet appointed to be wholly turned by its seed. It is proved. For the Body of the air cannot make a shadow in the air; but whatsoever doth exhale out of a live Coal, doth make a shadow in the Sun. For since the air hath a limited consistence and thickness, and that agreeable to its own simpleness: it followes, that whatsoever is thicker than the air, that is not air. Moreover, that which being made thin by the heat of the fire, doth now exhale, is as yet thicker than the air; and so for that cause, makes a shadow; surely that shall become far more thick in the cold, and shall be made visible in Clouds.

22 Whatsoever exhalations therefore do from the Earth climbe upward, and are joyned in Clouds; for this cause also, those Clouds do stink, no otherwise than as water doth under the Equinoctial line: and there the Ferment and Seed of their Concretion or growing together being consumed, they are turned into pure water, no otherwise, than the water is, after it hath escaped and overcome the bounds of its putrefaction: which it had conceived under the line. The dew therefore is a Cloud belonging to the Spring, not yet stinking, falling down, before it can touch the place of

23 cold. So a mist or fogg, is a stinking Cloud, not as yet refined through the putrefaction of its Ferment: because as many as have passed over the *Alps* with me, have known, how greatly, Clouds taken hold of with the hand, do stink; but the Rain-water collected thence, how sweet and without favour it is, and almost incorruptible.

24 For when any thing doth exhale, whether it be in the shew of water, or Oil, or smoak, or mists, or of an exhalation, although indeed it brings not away with it, the feedes of the Concrete or composed Body, at leastwise, it carries the Ferments upward, which that they may be fully abolished from thence, and that the remaining matter may return into water, it behooves, that they be first lifted up into a subtile or fine Gas in the kitchen of the most cold air, and that they passe over into another higher Region, and do assume a condition in the shape of the least motes or Atomes.

25 And that the Ferments do there die, as well through the cold of the place, as the fineness of the Atomes, as it were by choaking and extinguishing. For cold is therefore a principle not indeed of life, but of extinguishment. To wit, as it doth sub-divide the parts of the Atomes, as yet by more subtilizing them, even as I have above taught. And so that Woods are also the sooner consumed by fire under cold, as if they were driven by a blast. From which necessity, verily that place was from the beginning, alwayes chilled with continuall cold. Because the Authour of nature, least he might seem to have been wanting to the necessities of his Creature, hath every where fitted ordinations according to necessities. Therefore cold is naturall and home-bred to that place: but not from the succeeding Chymera of an Antiperistasis. Indeed the matter of fruits being brought thither, must needs return into their first Being; and the infections of the Ferments are therefore first to be removed, by the mortifications, sub-divisions, subtilizings, piercings, choakings and extinguishings of the cold.

26 The Air therefore is the place, where, all things being brought thither, are consumed, and do return into their former Element of water. For in the Earth and water, although Bodies sprung up from feedes, do by little and little putrifie, and depart into a juyce; yet they are not so nearly reduced into the off-spring of simple water, as neither into a Gas. For Bodies that are enfeebled or consumed, do straight-way in the Earth, draw another putrefaction through continuance, a ferment, and Seed: Whence they flee to second Marriages, and are again anew increased into succeeding fruits. But the fire, the death of all things, doth want feedes, being
sub-

Subiected to the will of the Artificer, it consumeth all feminall things, but brings over their combustibile matters into a Gas.

Paracelsus affirms, that three Beginnings are so united in all particular principles, that one cannot wholly be freed from the other, by any help of art. But saving the authority of the man, our Handicraft-operation containing his secret, *Samech*, hath affirmed, that which is contrary to his assertion, by the Spirit of Wine being turned into an un-savoury water. And so neither can that man cover his ignorance. Indeed the Spirit of Wine being wholly capable of burning, made void of Phlegme or watery moysture, and Oil; it alwayes for the one half of it, passeth into a simple, un-savoury, and Elementary water, by a touching of the Salt of Tartar on it. Again, the same thing is made by repetition, as to the other part. For that man was ignorant of the thingliness of a Gas (to wit, my Invention) and next of the properties of cold in the Air; yea he thought that the vapour of the water was plainly annihilated: which sottishness of that his proper form of speech, is least of all to be winked at in so great a Distiller. Especially, because he would have the Elements to be seperable from feigned Elements, rather than the three first things. Wherefore from the distillation of the water delivered, it now sufficiently appears, that the simple water is not crude or raw, and that fire doth not take away the crudity from it, which it hath not. Because the whole action of the fire, is not into the water, but into that which is co-mixed with it by accident.

Galen according to his manner, transcribing *Diascorides* word for word, and being willing to measure the Elementary Degrees of Simples, he hath not attempted it by the discretion of his Tongue: and so he divined, that more of the fire had concurred to a mixture, where he found the more sharpness and bitterness. Which thing, the Schooles even till now hold as authentical; although *Opium* being bitter, hinders it, although *Flammula* or *Scarweort*; (the Glasse being close shut) layeth aside its tartness; as also Water-Pepper, and the like. And what things are moyst, do burn or sting, but dried things do binde. Neither shall the *Galenists* easily finde out a way, whereby they may bring fire for water-Pepper, under dirt. For it hath been unknown in the Schooles, that all properties, not onely those which they call occult or hidden, but also that any other properties, do flow out of the lap of seeds: and all those which it pleaseth the Schooles themselves also to call formall ones. Surely I do experience four Elementary qualities, to be as in the outward bark of things; the second qualities to be more dangerous or destructive; but the most inward ones, to be immediately pressed in the Archeus. Yet all of them to be from the bosom of the seede and forms: But no quality to come forth from the first matter, as neither from the Wedlock of the Elements, because they are both feigned Mothers. But because the water which is brought into a vapour by cold, is of another condition, than a vapour raised by heat: therefore by the Licence of a Paradox; for want of a name, I have called that vapour, Gas, being not far severed from the Chaos of the Auntients. In the mean time, it is sufficient for me to know, that Gas, is a far more subtile or fine thing than a vapour, mist, or distilled Oylineesses, although as yet, it be many times thicker than Air. But Gas it self, materially taken, is water as yet masked with the Ferment of composed Bodies.

Moreover, *Paracelsus* was altogether earnest in seperating four Elements out of Earth, Water, Air and Fire; and so from his very own Elements: which seperation notwithstanding, he denieth to be, from the three first things, possible: as if those three first things, were more simple, and before the Elements: Being unmindefull of the Doctrine many times repeated by him: To wit, that every kinde of Body, doth consist onely of three principles; but not of Elements: because Elements were not bodies: but plates, and empty wombs of bodies or principles, void of all body. For although the Elements are among us commonly not believed to be undefiled; yet *Paracelsus* calls them so: the which he teacheth, are by art to be seperated from pollutions. But this description receiveth the air in one Glasse, common water in another; but the Earth, either of the Garden, or the Field, in a third; and at length, the flame of the fire in a fourth. But he shuts the Vessels with *Hermes's Seal*, by melting of the neck. And the water for a moneth, continually to boyl in its Vessel. As though that thing could possibly be done, and the Glasse not the sooner leap asunder: especially, because he commands the water to be shut up without air, unto the highest brim of the Vessel (and the Glasse to be melted, to wit, with the water.)

Lastly;

Lastly, he conceives a flame in the Glasse, and in the very moment wherein it ceaseth, it is no more fire, but an airy smook: nor is the fire a substance. Last of all, nor can the fire be detained within the compass of the Vessel. In another place, he denieth any Element of fire besides the Heaven; but now, he calls the fire, the Gas of the thing burnt up. And he exalts these his trifles for causes of great moment, the which notwithstanding, he dared not to name. Because the doubtful man hath exposed his Dreams to the World, in hope of deserving thereby, the name of the Monarch of Secrets.

CHAP. XIII.

The Gas of the Water.

1. The Gas of the water differs from a Vapour. 2. A Demonstration from Creation. 3. That the Air in Genesis is signified by the Heaven. 4. That in the Firmament is the operative Principle of dividing of the Waters. 5. The separating Powers of Waters in the air. 6. A History of a Vapour. 7. Gas differs from the exhalation of the aunts. 8. A supposition of Principles. 9. The manner of making in a Vapour. 10. The Gas of the Water. 11. An example in Gold. 12. The Gas of the Water is shewne to the young beginner. 13. The incrusting of the Water. 14. The heat of the Alps is great, yet not to be felt. 15. That Cold is not the absence or privation of heat. 16. Why Gas is an invisible thing. 17. Why the Stars do twinkle. 18. Why the Heaven is of an Azure colour. 19. The Air knowes not the motion of snatching. 20. Above all Clouds, the Air is not voyd of all motion. 21. What quietness there may be in that place. 22. Gas is the Mother of a Meteor. 23. Gas and Blas, do constitute the whole re-publick of a Meteor. 24. The Sun is hot by it self. 25. The soils of the Air are the folding doores of Heaven. 26. Why some are side-windes, but others perpendicular or down-right ones. 27. From whence the Blas of the air is originally stirred up. 28. Two Causes of every Meteor. 29. The water is in the same manner that it was from the beginning. 30. From whence there is a stability in the quiet Perolede or Soil of the Air. 31. Peroledes are proved. 32. A solving of an objection. 33. The water is frozen of it self occasionally, but not effectively, by cold. 34. Why Ice is lighter than water. 35. The proportion of lightness in Ice, by Handicraft-operation. 36. The constancy and simplicity of the water. 37. That all Beings do after some sort feel or perceive. 38. A Vapour doth sooner return into water than into Gas. 39. The changing into a Vapour, in respect of the air the seperater, is oblique or crooked. 40. The air is dry, and cold by it self. 41. In an elementated Body, there is not a simple and an every way sameliness of kinde. 42. The rarefying of the Sulphur of water, gives smoothness to Ice: but not the immixing of a strange air. 43. In the Patient or sufferer, re-acting differs from resistance. 44. It is proved by 17 Reasons, that air is never transchanged into water, nor this into that.

GAS and Blas are indeed new names brought in by me, because the knowledge of them hath been unknown to the Antients: notwithstanding, Gas and Blas do obtain a necessary place among natural Beginnings. Therefore this Paradox is the more largely to be explained. And first, after what sort Gas may be made of water, and how different a manner it is, from that, wherein heat doth elevate water into

into a Vapour. And likewise we must know after what sort these things do happen, by the dissection of the water.

I will therefore repeat, That the thrice glorious God, in the beginning, created the Heaven, and the Earth, and the great deep of waters: But the great deep began from the hollownes of the Heaven, and was bounded upon the Globe of the Earth. Nothing is there read of the creating of the air, which notwithstanding is a Body, and created into an Element, not indeed after the six dayes Creation, that it might fill up the place, where the air now is.

Therefore the Heaven designeth or signifieth the Air, and the matter of the Heavens, is otherwise, hitherto unknown. And then the Eternall created the Firmament, that it might seperate the waters which ought to remain under it, from those that were to remain above it. But the Firmament was not as it were the flood-gate, or as it were an idle partition of the waters: but rather the operative Principle of that seperation. Even as the Sun, is not the middle partition between the day and the night; although it was made to seperate the day from the night: but the Sun is the maker of the day it self. Therefore the Heaven or Air was appointed the seperator of the waters, to endure as long as the very World it self. For which cause, it hath obtained two notable powers. To wit, exceeding coldness, and dryness proportioned thereunto. It hath indeed great lights in it, which are rowled about in it, and the which, however they may mitigate its in-born cold: yet the air ceaseth not from that office of a seperator. And in what part that kinde of seperation ought to happen (which is neere to us) there are no lights at all; yea, nor also far aloft.

But by how much the neerer that air toucheth at the Chambers of the blessed, it abounds with many lights. Thus is the air it self disposed. But now I will set upon the History of an exhalation, which contains a vapour and also a Gas, and so we must examine the thing contained in the air.

For neither is Gas a dry, and Oily Body, which the Antients have called an exhalation: but it containeth moreover, another watery body also, besides Vapours, from whence the body, manner, and progress of Meteors will be known.

I consider the body of the water, to contain in it an Elementary, and native Mercury, liquid, and most simple: next an un-savoury, and alike simple Salt. Both which, do embrace within them, a uniform, homogeneous, simple and unseperable Sulphur. These things I suppose, even as Astronomers do their excentrics, that I may go to meet the weakness of our understanding.

Therefore the Salt of water, as it is moved, and waxeth hot from the least lukewarmness, being impatient of heat, straight-way climbs on high, as it were to the place of rest and refreshment, with a proportionable part of its own Mercury. And for that cause, the Sulphur also being unseperable from both, ought to accompany them. The three things being thus conjoynded, are the vapour, which being brought into the luke-warm air, for the same Reasons, hasteneth to ascend, untill it hath touched the places of its refreshment, provided by the Creator. Whither the vapour being now brought, the heat which troubled it being presently laid down, the Salt as it were repenting of its flight, could wish, that it might again receive a resolving in its Mercury, and return into its former state of water. But the lofty and troublesome cold of the place hinders it.

By occasion whereof, the Mercury of the water is so frozen or congealed, that it is unfit for the resolving of its Salt. Wherefore that vapour is presently changed into a Gas, and Gas hanging in doubt, in a shape, wanders up and down: So that, unless the cold did dry up the Sulphur of the water in a bark or shell, and in this respect divide it, every vapour and Cloud (even as in our glassen Vessels) as being heavier than the air, should by and by rush downwards. Hence we see, that vapours having slid down a little beyond their bound (even as straightway after great colds, when as the South winde blowes on it at unawares) the Mercury of the water being unfrozen, that the Salt is at length easily resolved within its Mercury. For the importunities of cold and heat, do command the Beginnings of the water, to be turned inward or outward. For so the lesser rains and the dew, do fall down in the least Atomes, as it were descending and resolved vapours. Therefore there is not a new and substantiall generation, while of water, a vapour is lifted up; since it is only an extenuating, by reason of a turning of its parts outward. As neither also, while the Mercury of the water doth resolve the Salt, which it again shuts up within it self, and is changed into rain. Which is nothing, but the resolving of the former

mer Atomes of the water, and a co-uniting them into greater drops: For a changing of the essence doth not interpose, where there is onely a locall dividing, and turning of parts outward.

11 For example, yellow and malleable gold doth not change its essence, while being dissolved by *Aqua Regis*, it hath the colour of Iron rust, nor while it waxeth black in *Chrysulca*, and is beaten into the smallest powder.

12 Moreover, that thou mayest know Gas; in the first place, meditate, the air to be the seperater, next to be simple in its Root, so likewise to be simply cold and dry. Since therefore heat and cold, are more active than moysture and dryness: therefore the moysture of the Mercury doth first suffer by the coldness of the air: and seeing that the Mercury and Salt of the water, are more cold than its Sulphur, therefore they are more speedily affected, and first of all indeed the Mercury, because it is the coldest of the two Companions. But since every thing desireth to remain in rest without the change of successive alterations, and since the Elements also ought to remain without destruction; therefore the Mercury and Salt of the water do hasten to preserve themselves from the coldness of the air.

13 And so they co-thicken, arm, and incrust themselves in Ice, that they may the more resist in soundness, which otherwise, being changed into Gas, are lifted up (for it is alwayes a property of the air, to seperate the waters from the waters) or else they stop or hinder that changing and flight. But if indeed the water being stirred or disturbed, is not made Ice, then the cold and dryth of the air do lay hold on the three first things of the water, so as the Mercury of the water is made incapable of resolving the salt in its moysture. And so the Salt doth, under the cold, after a sort wax clotty in the Mercury and Sulphur: So as that the Sulphur being more dry than the other two, doth also more easily suffer than its fellowes, and more from the dryth of the air, than from its coldness. Wherefore the Sulphur is enlarged into the smallest parts, and the Mercuries and Salts of all which parts being made clotty, they thrust their Sulphur outward, that it might suffer from the dryness of the air. Wherefore, seeing the Sulphur is equall, to either of them both, the other two must needes be divided, and enlarged, according to the measure of the Sulphur. From whence the Mercury with the Salt of the water, are also most easily frozen within the Sulphur, by the cold of the air. Wherefore seeing the Salt and Mercury are unfit for the moystening of the Sulphur, they are likewise necessarily changed into Gas, and being more and more made fine, they are sub-divided even into the utmost and possible fineness of the Element. Therefore Gas differs not in substance and essence, but by way of alteration onely. For the Salt in the vapour being impatient of heat, riseth up with the Mercury, and they have the Sulphur included in themselves: And Gas turns the Sulphur of the water outward, thoroughly dries it, and sub-divides it. For the vapour, while it toucheth at the place of its refreshment, doth for the most part wander up and down (half congealed in the shape of a Cloud) nor doth it ascend: but the cold of winter coming on, when now that Region of the air doth beyond measure wax cold, straightway the air becomes clear, the Clouds do sever or disperse, and are changed into Gas. In the Mountains of *Helvetia* and *Subandia*, the Clouds do float under ones feet, and through their holes, we behold the World downward, by reason of the cruel cold of the place: but whatsoever is above the Clouds, is without a Cloud, because that whole vapour is by degrees extenuated into Gas, and ceaseth to be seen.

14 Indeed the Sun shines clear in that part, unless it do snow; but the heat thereof is not to be perceived, although I have seen my Companion, on that side whereon the Sun-beams had directly struck him a whole half day, to have scorched his face and neck, no otherwise than as if he had applyed *Cantharides*. And that, without the feeling of heat or pain. For neither doth this come to passe, through the too much subtilty of the air and heat. For truly degrees of heat, but not the fineness and purity thereof do burn: yea the thicker body, as Iron, burns more fervently than the live Coal that is thinner. And much lesse, by reason of the reflexion of beams. For truly he was burned in that part, whereon the Sun, but not the adverse reflexion of the Mountain did strike him. For the cold of the place causeth, that the heat of the Sun is the lesse felt.

15 Hence indeed it is manifest, that cold is not a meer absence or privation of heat, or a [non-Being.] For truly here, both of them do stand, also distinctly operate, and that indeed in a high degree. And do make the air, by their tempering,

to be almost the sweetest in the whole world. Yet the Snow cannot be melted in the *Mountain* by that heat of the Sun; because the cold of the Snow, and also of the place, are both suitably equall to the heat of the Sun. But by how much a man is hotter than the snow, by so much indeed the heat of the *Sun* doth prevail; and mightily burn; for that humane warmth doth almost wholly exclude the cold of the place, and the heat of the Sun doth almost act alone by it self.

While Vapours and Clouds are made Gas, they are made fine, and by how much the finer they are, by so much the higher also do they climbe in sub-dividing, and do more than the light; For otherwise the Sun, by reason of the multitude and thickness of the Clouds, should never shine on us, and much lesse should it heat the Earth. Therefore the Stars do twinkle, and the whole Heaven being void of colour, is bright or cleare; yet it sheweth an Azure colour. For although Gas be a most subtile thing, and invisible in its own body: yet because it as yet, differs from the every way clearness of the Air, therefore in so great depth of it self, it dissembles a Skie-colour.

For Gas, which in its first division, I have said, to give a shadow, in a thousand sub-divisions of it self, doth not appear, unless that in much depth, it, at least sheweth the aforesaid colour. It is also a frivolous thing, that the air is carried about by the snatching motion of the first Moover. Because Clouds do follow the guidance of the windes: But the motions of the windes are irregular, because they are of the Blas of the Stars; but not of the mooving of the Orbs. And moreover, far above the Clouds, the air is almost unmooved. For truly, a Dutch Merchant ascendeth a Mountain in the *Canaries*, which at this day is thought to be the highest of the whole World. But there was one guide, two Masters, and as many Servants, five Camels, one whereof was appointed for Victuall and Fodder. In the fourth moneth called *June*, early in the morning, they went up: But they had scarce gone an houres space, when as the cold offended them, and they complained all the day, that about night, it would be so unwonted, that they ought to increase their Garments. On the third day in the morning, about three houres after Sun-rising, they came to the top of the Mountain. For there in the Sand, were the steps of Camels, imprinted a year before, being as it were new made, and the names of certain persons written on the ground, as if it had been with a yesterdaies finger. For, besides a most exceeding sweet air, they found no Vegetable for want of rain. Therefore they hastened to descend, the Camels all the five dayes space, being nothing at rest, except a little while, wherein they might take their Fodder. But all the third day, they were distant perhaps fifteen *Italian* miles from the Horizon. But although this Region of a quiet air did not so feel the tempests of windes; yet notwithstanding, it must needs have a sweet flowing air, and an alterative Blas; not onely, because it suffers day and night, cold and heat: but also because it transmitteth the Blas of the Stars, receives the lower Gas, and suffers other Consequences from thence. And, as that Region sends thorow it the alterations of the Stars, so also it conceiveth and partaketh of them. For the Sun (let the same judgement be of the other Stars) cannot but heat, which burneth Bladders in the coldest Mountains, and it is required, that this heat be there in the day-time: Because also the night there wanteth this heat. Therefore those successive changes must needs be in that very place entertained. After the same manner also, the beams of the Stars, with their full forces, do passe thorow the vast Monarchie of the Air, and in it do sow their alterations. For neither, although they do not produce their proper effects, but in the bound of their scope into which they are directed for the use of mortall men; yet they cease not to season the air (by altering it) with their impressions, throughout the bounds where they passe. And as yet the rather, because in this part are the Floud-gates of Heaven: that is, in the huge space of the quiet air it self, is the Gas of the water, which by the most exact rarefying of sub-division, is many times re-shaken & sub-divided by the colds through which it hath passed. This Gas at least should never of its own accord return into its auntient water, nor should descend unto the most cold places through which it escaped by climbing upward, unless the uppermost Blas of the Stars should force its descent. And so the Region of the still air is not void of successive changes, but that the Rain doth not there moysten the ground, nor the rage of windes serve for the commotion of the waters. For since the Gas which it keepes in it self, is now reduced to so great a fineness of it self, and all its Atomes being as it were roasted with heats in the outward superficies of the Sulphur; surely they cannot return into rain, unless by a sweet winde, they descend to the middle Region; where they do re-take the beginnings of

coagulating, under the luke-warm blowing of the air. For a certain alteration opposite to that place from which the Gas departed, ought to reduce the Gas into water. For a sweet luke-warmth in the still air, maketh the Atomes of Gas being covered in their own Sulphur, to divide: which Sulphur (a skin being as it were broken thorow) or like a Glasse, that is brought suddenly from luke-warmth into the cold) is broken; and so the Mercury of the water doth dissolve its Salt, at the dissolution whereof, the Sulphur it self may be melted into its former water.

22 And that kinde of inversion or turning in and out of the body of the water, and that torture through the exact searching of the cold, is necessary, that all the power of the Ferment, may be wholly taken away out of the Clouds. For else, much corruption, and the much stink of mists, would soon destroy mortalls. As in Silver being melted, the exceeding small atomes of Gold do slide to the bottom; So do the atomes of the Gas settle, and by sliding they do increase or wax bigger, which otherwise, being infirm by reason of the coldness of the Air, are again lifted up, unless a gentle or favourable luke-warmth, in the coldest place, did now and then hinder it. For so indeed rains, shoures, storms, so Hail, Snow, mist, and Frost, are through an alteration by accident, having arisen as well from a motive, as an alterative Blas, in the most cold places. And so Gas and Blas have divided the whole Common-wealth of a Meteor, into Colonies.

23 In like manner, I have learned by the examples cited, that the Sun doth not heat by accident, but by it self, and immediately. And that heat is as intimate and proper to it, as its light is to it. The Air hath therefore its grounds or soils, no lesse than
24 the Earth, which the *Adeptists* do call *Peroledes*. Therefore the invisible Gas is entertained in the various Beds or Pavements of the Air, if the Water hath its depths
25 of its Gulfs; its own Gates are in the *Peroledes*, which skilfull men have called the Floud-gates and folding doores of Heaven. For neither is Gas falling down into the place of Clouds, carried out of the depth of Heaven without its director Blas. Yea it falls not down but throw ordained Pavements and folding-doores.

26 For all the folding-doores do not promiscuously lay open to the Planets; but all the Planets in particular, are by their own Blas, the Key-keepers of their own *Perolede*. Which thing I submit to be examined by Astrologers that are the shewers or disclosers of Meteors, and I promise that they shall finde out a rich substance. For so windes do sometimes halten perpendicularly downwards, and smite the Earth, but otherwise they go side-ways out of their folding-doors, they beat down Houses and Trees; as also bring miserable destruction on all sorts of Shipping. But the more luke-warm Air, doth foreshew the Winde to come out of the depth of the Air and the Gas to bring with it the Blas of Heaven downwards. Whence Gas is straight-way again resolved into a Vapour, and afterwards into rain. Indeed Clouds do then appear, which not long before, were not beheld at any corner of the World: Because the invisible Gas slides downward, out of the depth of the upper Air, the which growes together into vapours, and from thence into drops. For that is the appointment of the Air, that it may continually seperate the waters from the waters. But seeing that one part of water, is extended at least to a hundred fold of its dimension, while it is made a vapour, and so much the finer, by how much the Gas thereof is sub-divided into the more lesse parts, and since there is that order, and that law of universe, that all things may be carried on for the necessity of man, and the preserving of the World;

27 Indeed in this respect, do heavy things tend upward, & light things are drawn downward. Hence it hath seemed to me, that the Blas of the Stars is disturbed into rain, and is carried into clearness, and other seasons, as oft as the pluralities of Gas it self, in the still *Perolede* of the air, do seem to threaten, almost choakings, and the too-much compressions in the air. Yet I am not so carefull concerning the occasionall causes of a Meteor; it is sufficient that I have known an exhalation arising from beneath, to wit, a vapour, and Gas, to be the materiall cause of every Meteor. It sufficeth to have known Blas to be the effective cause, by the authority of the holy Scriptures. *The Stars shall be to you for times or seasons, dayes, and years.* This therefore is the
28 unresistable appointment of the water, that by proceeding continually upwards and downwards, it should answer no otherwise than as the windes by an inordinate and irregular motion, do answer to their Blas of the Stars.

29 And so the water which existed from the beginning of the Universe is the same, and not diminished, and shall be so unto the end thereof. But I meditate of the *Peroledes*

roledes or Soils of the Air to be as it were the Bottles of the Stars, by which they do unfold their Blas, (even through their determined or limited places) for the uses and interchangeable courses of times or seasons. And chiefly, because the upper and almost still Perolede, doth contain the cause, why there are windes, fruits, dewes, and especially things pertaining to Provinces.

For seeing that the winde is a flowing Air, and so hath an unstableness in it, we must needs finde the locall cause of stability in the more quiet Perolede. Therefore the folding-doores are shut, or laying open in the Perolede, according to the Blas of the Stars which they obey. Not is it a wonder that there are limits, or invisible bounds in the air, of so great power, and capable to restrain a heap; for the visible World doth scarce contain another Common-wealth of things, and the least one of powers. For who will deny, that under a Rock or great Stone of *Scotland*, scarce 12 foot broad, and deep 30, there is not some division of a Perolede, (that in the mean time I may be silent concerning the Equinoctial Line, and its wonderfull properties) that a Canon being discharged on one side of the Stone, not any noyse or trembling should be heard on the other side thereof: the which therefore is called a mute one. So also we must needs consider that there are side folding-doores, or Gates of Peroledes in the Air, because the windes going forth for the most part with a side motion, are also by the Blas of the Stars, agreeably carried a-crosse their bounds.

From the aforesaid Doctrine of Gas, I at length object against my self. If the water be frozen by cold into snowes, Hail, and Ice: then the water shall not be dissolved by cold into Gas, if of a uniform Agent and Patient, there ought to be the same action and effect. Where I must seriously note, That the Water freezeth it self, but is not frozen efficiently by another. For although cold may be hitherto thought to congeal; yet that is onely occasionally, not effectively. The water therefore, after the sense of its measure, perceives the cold of the air, not indeed a certain absence, or privation of heat (even as I have already demonstrated by an ordinary example in *Helvetia*) but as a positive cause in a naturall quality. For truly first of all, it is without doubt, and is manifest by the sight, that the cold Air, doth by degrees consume Water, Snow and Ice: yet these two more slowly, and the other, more swiftly. In the next place, it is easie to be seen, that whatsoever the Air thus privily steales away, that presently, for that very cause, passeth over into an invisible Gas. If therefore the cold of the Air should harden water into Ice, a further action of the Air, would also (the Ice being now made) continually cease; but the consequent is false: therefore also the Antecedent. For the Sulphur of the water doth easily wax dry, and is divided by the cold; wherefore the Mercury and Salt of the water, perceiving the frost of the Air, that would sepearate the Waters from the Waters, and that they ought to suffer the extension and drying up of their Sulphur, and so an altogether violent impression of the seperater, and that they do desire to remain as they are: Hence the whole water at once, doth armit self by a Crust, that it may resist the seperater. Which thing indeed it could not accomplish, but that also some part of the Sulphur, hath already suffered an extenuating of it self, and so also in this respect, the Ice doth swim upon the water. But, that the Sulphur of the water, although it was extenuated in the Ice, yet hath not laid aside the nature of water, is proved by handicraft-operation.

Fill a glassen and great Bottle, with pieces of Ice, but let the neck be shut with a *Hermes* Seal, by the melting of the glasse in the same place. Then let this Bottle be put in a balance, the weight thereof being laid in the contrary Scale; and thou shalt see that the water, after the Ice is melted, shall be weightier by almost an eighth part than it self being Ice. Which thing, since it may be a thousand times done by the same water, reserving alwayes the same weight, it cannot be said, that any part thereof was turned into air.

For such is the continuance and constancy of the Elements, that although the water departs into a vapour, into Gas, into Ice, yea into composed bodies; yet the auncient water alwayes materially remaineth, in some place masked by ferments, and feedes coming upon it; and else-where, onely by the importunities of the first qualities, made to differ in the *Relollem* of *Paracellus*, that is, without a seed. But from what hath been said before. Some remarkable things do arise. 1. That the water hath a certain kinde of sense or feeling, and so, that all Beings do after some sort partake of life. Come let us worship the King by whom all things live. 2. See-

ing that the water doth not incrust it self in the fabrick of a vapour; therefore a vapour as well in the cause, as in the manner, is more acceptable to the water than a Gas is. And that thing doth argue in the water something like to choice. 3. And that therefore a vapour doth sooner return into water than into Gas. 4. That the changing of water into a vapour, is, in respect of the seperater, oblique or crooked, and as it were by accident: but that Gas consisteth of a proper appointment of the air, whereby the air doth seperate the waters from the waters. 5. That the air is far more cold in it self, than the water. 6. That it is dry by it self. 7. That the unity or connexion of entire parts, is as acceptable to nature, as the dividing of the same is to things opposite. 8. That the fabrick of Gas, shall afford another intimate principle to the water (since it hath not a compositive beginning) or part that is the cause of some small difference of kinde, besides that which is touched by heat in the rise of a vapour. 9. That all created things, by how much the more simple they are, by so much the more of the same kinde: yet an every way most simple homogeneity or sameliness of kinde, is not found in bodies. 10. That the Sulphur of the water being extenuated in the Ice, is the cause of smoothness in congealed things, but not the enclosing of a foreign air: because alwayes and every where, water doth exclude the Wedlock of air. 11. That the cold and dryness of the air, can act nothing else into the water, but to extenuate its Sulphur: But that the congealing or hardening it self, is an action proper to the water, whereby it puts a stop to the seperater. 12. That the air acts upon the water, without the re-acting of this, and the suffering of the air: since it is appointed by divine right, the seperater of the waters. 13. That even in unsensible naturall things, re-action differeth from resistance. For truly there is no re-action of the water, on the air, and yet the water is with a resistance. 14. That the Schooles have erred, because they have dictated every action of nature to be made with a re-acting of the Patient, and a suffering of the agent. 15. That the changing of Gas into air is impossible. 1. For otherwise the air should alwayes increase into a huge body, and by consequence, all water had long since failed. 2. Because, besides that which I have elsewhere demonstrated, that the air can by no meanes return again into water, the same thing is manifest from the but now aforesaid particulars. 3. For truly it is proper to water, to suffer by air, and not likewise to re-act on the air: Therefore air being once made by water, should alwayes remain air: seeing a returning agent is wanting, which may turn air into water. 4. But for air, by it self to return into water, opposeth a generall Maxim. *That every thing, as much as in it lies, doth desire to remain in it self.* 5. Especially because air wants in it self, a dissolutive principle of it self, caused by the rottenness and interchangeable course of parts. 6. If air should at any time be made water; that thing should especially be, while air is pressed beneath the water. And if in water there should be the action of water, it should then chiefly obtain its effect upon that air. Therefore fill a Glass Bottle half full of water, and stop its mouth with a Cork, that nothing may breath out, then shake the vessel strongly a thousand times upwards and downwards, that all the water may as it were froath into bubbles: At length notwithstanding thy pains, thou shalt not finde air to have departed into water, or water into air. 7. If therefore water doth not change air into it self (otherwise, a natural agent works to this end, that it may make the Patient like it self) there is no other thing afterwards, whereby the air may be made water: Where, as it were by a Parenthesis, it comes to be noted, that the aforesaid Maxim looseth its universality and truth, not onely in the Elements, where a mutuall action happens among each other without a desire of changing one into themselves: but also in the Heavens: yea, and also in very many compound bodies. For neither doth Mercury in its whole and indivisible substance, therefore kill lice, that it may make them like it self. So neither doth Amber draw Chaffe, that thereby it may make it Amber. Therefore by a strawie argument, the Maxim of the Schooles falls to the ground, which otherwise is blown away with a light winde. 8. For if air were changed into water, that would chiefly happen where those two Elements are co-mixed with each other in their smallest parts, for that is in the Clouds: But in the Clouds this comes not to passe: because, in whatsoever place, degree, manner, and quality, the air hath touched on the superficies of the water, the water is alwayes lessened by the air, never at any time increased. Therefore there is no action of water into air: for if there were any, it should be in the hollow superficies of the air, where the force of the Element of water, residing in its native place is strongest, and most conjoynd: but there the

air consumeth the water, because it divides it into a vapour. Therefore air never departs into water. 10. Seeing therefore no Element hath in it self a Root, by which, it being as it were affected with wearisomness, may change it self into another Element: for truly, every transmutation, proceedeth from a duality or a twofold thing-ness, elsewhere, but there is not a voluntary desire in an Element, of dying, and converting into another; and an appetite, appointment, and necessity of increasing, of nourishing, of exchanging it self, or of changing the nature in which it was created of God, is wanting. 11. Vain therefore is the contentious co-mingling of Elements in compound bodies; and frivolous is the transmutation of one into another, seeing none of the Elements is careful for the passing over of its being, from another, nor from it self. Wherefore I have first concluded with my self, that the water and air are primary Elements, nor that they can ever make a retrogression or return. 12. For the blessed Parent of Nature would not that the Elements should be hostilely opposite, and applied, that they should breath forth mutuall destruction and devouring continually, and that they should be so often made, fail, and with so many daily formall privations, should rise again from death unto their former state, without the interposing of a more simple mean. Which mean surely should otherwise be desired to be a partaker as well of air as water, and yet ought to be neither of these. 13. Therefore the holy Scriptures do name the air, the seperater, but not the destroyer or annihilater of the waters. Nor is it right, that the air should be drawn to other offices, than those which are enjoined to it by the Workman and Lord of things. 14. Finally, rarefying, or condensing, do not change the essential form of the water, because they are materiall dispositions destitute of an Archeus. 15. Moreover, if water having suddenly taken to it a ferment and seed, be transchanged into a concrete or composed body: Yet that is perpetuall to it by an Elementary priviledge, as neither therefore, that it ever layes aside the matter of Elementary water. 16. It is granted indeed to seeds, to frame their composed bodies out of water, and to act their Tragedy (by the defluxion of forms) untill death: But the forms of composed bodies do not therefore destroy the simplicity of water, and sameliness of its form: Much less than the Soul coming suddenly on a body, doth destroy the form of flesh. For subordinate forms, do every where, in composed bodies, suffer together with each other: Therefore much more doth the form of a composed body, suffer also the form of its own Element to be untouched. Last of all, although the air by its greatest coldness, doth change the water into Gas, yet it never desisteth from the office of Seperater of the waters. So that if its cold be restrained, at least by its dryth, it ceaseth not to raise a vapour out of the water. For the action of the Heavens in their circumvolving, is uncessant, and next also the obedience of the air and water is continuall; yea, there is an interrupted thread in the acting of all seminall things. For truly, created things do alwayes respect the will of their Creator, which man alone neglecteth.

CHAP. XIV.

The Blas of Meteours.

1. *What Blas is.* 2. *The Blas of a Star, worketh more famously by locall motion, than by light.* 3. *What the Motive Blas of the Stars is.* 4. *What the Winde is, and whence it may be moved.* 5. *That the Stars are made for us.* 6. *Divers activities in Blas.* 7. *That the activities of the Stars are brought down by Blas the executer of motions.* 8. *The error of Paracelsus.* 9. *The two great Lights do work their own properties,* 10. *How the influences of the Stars may be reduced under the two Lights.* 11. *The Births of rains and Meteors.* 12. *Putrefactions by continuance do arise straightway after the sliding down of the Waters, whence are the Ferments and seeds of things.* 13. *A History of Cyprus.* 14. *A resolving of a Question touching the rest or quiet of the Summer-air, and the continuall breathing of the Winter-air.*

1 **T**HE Stars are to us for signes, times or seasons, dayes and years. Therefore they cause the changes, seasons, and successive courses or interchanges. To which end, they have need of a twofold motion, to wit, locall, and alterative. But I signifie both these by the new name of Blas. And they do rather stir up a Blas by their mooving through a place, than by their light. Indeed in a dark night, the South winde oft-times followeth the blowing North-windes, and this likewise, it. Therefore because Blas breaths forth a luke-warm winde, it hath need, not of the heat or light of Heaven it self; but of place, direction and connexion. Whither, when the light of the Stars shall descend, the folding-doors do open and shut themselves.

3 Therefore let the Key-keeper of the folding-doors, be the motion of the Stars. Which also moveth the Peroledes or Pavements of the Air. Therefore all heat is not made by fore-existing fire, or light, nor doth cold shew a naked absence of heat: But the motive Blas of the Stars, is a pulsive or beating power or virtue, in respect of their Journey through places, and according to their aspects. Which circumstances in the Stars, do cause the first qualities on these inferiour bodies; no otherwise than bashfulness, anger, fear, &c. do stir up cold and heat in men. And that thing the Stars have by the gift of Creation.

4 The Winde according to *Hypocrates*, is a flowing Water of the Air: but I defining it by its causes, say, that the Winde is a flowing Air, mooved by the Blas of the Stars. And that for a naturall winde: but otherwise, it is often granted to an evill Spirit, that even without a Blas he should stir up windes, or increase a tempestuous Blas. Therefore the Air, unless it have a Blas, remains quiet, nor hath it the principle of motion from it self, but it comes to it from elsewhere. Therefore the motive Blas stirreth up Windes, tempests, over-flowing of Waters, by running thorow the divers Peroledes of the Air, sometimes upwards, sometimes downwards, across, long-ways, side-ways, into all the Coasts of the Earth: although the Elements have no need of motion, yet mans necessity requireth that motion.

5 But seeing nothing was for mooving of it self (except the Archeus granted to feedes) it hath well pleased the Eternall, to place in the Stars, a flatuous, violent, motive force, not much unlike to the Command of his mouth. So that Blas is for a testimony to us, that God of his excellling goodness, hath made the Elements, and Stars for us, by measuring out bounds of these according to our Commodities. Blas therefore mooveth, not so much by light beames, and motion, as motion: but as the Stars have come down unto certain places, whereunto these Stars do owe their offices. Therefore there are stable properties in those places: but if they are not stable, that happens in respect of other Stars brought with them by an analogicall or proportionable motion, for the interchangeable courses of continuance. Blas therefore

as a Masculine thing in the Stars, is the generall beginning of motion; it seemes no lesse to respect the Earth, than the Air and Water. For the Moon according to the holy Scriptures ruleth the night, as the Sun doth the day: although the Moon for her own half, runs not under the night. For the Globe of the Earth is divided into four parts, into two accesles or flowings, and recesses or ebbings of the Ocean daily. And it spends almost 28 houres therein; and so much the lesse, by how much the Sun and Moon shall in the mean time, depart from, or draw near to each other. Blas therefore stirs up also a raging heat in the waters, the winde being still. But the alterative Blas, consisteth in the producing of heat and cold; and that especially, with the changings of the windes. But the Stars, neither have nor give moysture or dryth of themselves.

For neither is moysture to be considered in nature as naked quality without a matter, and therefore neither is it brought down from the Stars unto us. For all moysture is from the water, which was before the Stars were born.

Therefore *Paracelsus* erreth, who saith, that rains, snow, &c. are so the fruits of the Stars, that they are boyled to a ripeness in the Stars, as it were in bottles. Dryness also was in the air the seperater of the waters, before the Stars: nor is it to be considered without a body, in manner of a quality.

But heat and cold are rather qualities abstracted from a body. Therefore there are onely two great Lights, and therefore two onely qualities of them are spread into the air, from whence all Meteors are stirred or mooved. For the heat of life, is the property of the Sun; but cold, of the other Star. Also the other Stars have given their names or honours to these two Lights. As often therefore as the Stars of the nature of the Moon, are brought thorow places of the Sun, a luke-warmth is made in the air; but if Stars of the nature of the Sun do run down under the same places, heat is made; according to which qualities of the air, the Gas of the air is also diversly altered.

Hence indeed Blas heats after the same manner, thorow the soils of the air: therefore Gas also, is either detained in its pavements or soils, or is brought downward to us. So as that the atomes of Gas, being invisible through their too much smallness, loosing their constriction, and excess of cold, do again fall together or decay into the smallest drops, and hasten downwards. But if indeed the luke-warmth doth affect the lower Peroledes, when Gas being provoked by Blas, wandereth downwards, Summer Snowes are made. Surely Gas being grown together through frost, a luke-warmth presently arising, it is melted, and rusheth headlong downwards. For the Mercurie of the water, resolvethe its Salt, and the Sulphur doth as it were rowl up these two: And so, they fall down into rain. But if indeed that thing happens in the upper Perolede, the drops descending, are frozen in the middle cold pavements; and so they are cast down headlong into Snow and Hails. But if luke-warmth do bear sway thorow some continuall Peroledes of the air, daily rains do accompany it. Hence also it appeares, that an unequall Blas, in divers soils of the air doth bring forth divers effects. For oftentimes the lowermost Peroledes are luke-warm, and the day is plainly cloudy, and there are very many Clouds. But else, the second and the third Perolede are luke-warm, the lower being cold; whence are Snowes. And so the other Troop of Meteors is caused unto us. Therefore I am now confident, that by Gas materially, and by Blas operatively and motively, their causes and manner do more clearly appear than heretofore they have done. From whence *Astrologers* and *Physicians* shall be able from a sounder ground, to presage of some things. In the mean time, I leave the matters of presages untouched, which God by his ministering Spirits hath laid up among his signes of good or ill. Onely I will relate what Fryer *Stephen* of *Lusignan*, the last of the Family of the Kings of *Cyprus*, of the Order of *S. Dominick*, in his description of *Cyprus*, printed at *Paris* in the year 1580, page 212, rehearseth in *French* to this purpose. About the end of the year, an Earthquake happened at *Famagusta*, which continued eight dayes. But afterwards, raging or Whirle-windes arose, passing over the Island, and entering into the Market-place of *Famagusta*; forthwith by beating down a great Pallace, they presently take away very many Houses, with some Men. So that if some *Marriners* had not by the chance of fortune, come suddenly unlooked for, *Famagusta* had been destroyed. Therefore let the Reader know, that the Eastern *Marriners* were wont, on the day that they do observe such Windes, to take a great Knife, wherewith they make the Sign of the Cross in the Air, and do utter these words. In the beginning was the Word, and the Word was with God, and God was the Word; and suddenly all the Whirle-winde, and

and tempest, separates it self, and ceaseth. For I have seen this experiment twice: And on the second time, while I returned out of Cyprus into Italy. For neither do I finde any thing of Superstition therein, but that the Knife must have a black handle: And so I can determine of nothing certainly. Thus far he. A wonder at least: That this diuinish tempest should cease, and the Devill spare the whole City, perhaps for the sin of one sinner.

- 14 Moreover about Blas, this is as yet considerable. If in the great heat of Summer thou holdest a burning Candle about the hole of a Window, there is no foot-step, for the most part, of mooved Air to be perceived: but throughout the whole winter, however small the hole be, a troublesome Winde breatheth, and that continually. But since there is not a greater quantity of air (let us now take the air for its Magnall or sheath) being constrained by reason of cold, than of that which is rarefied by reason of heat; there seemes not to be a stronger reason of this than of that, to stir up the Winde. Therefore there is a twofold Motive local Blas in the Air: one indeed which stirs up the Windes, and so includes a violence or swiftness, from a native power or motion: But the other, which followes as for an alterative Blas, for co-thickning, or rarefying in the air. But since this is almost universall, by reason of Summer and Winter; it also sends forth a certain flow flowing of the Air. And although cold may equally condense the Magnall, and the Air be in this respect unmoved, by reason of an alterative and violent windy Blas; yet seeing in the opposite Coast of the Sphere, the Magnall or sheath in the Air is generally made thin onely by reason of heat, the Air in the Northern Coast must needes partly go back, be knit together, and so occupie the lesse room, and partly be gently driven forward by the rarefying and rarefied Magnall of the Air that co-toucheth with it from the other half of the Orbe. And this is the cause of the Question proposed: to wit, of the flow and uncessant flowing in the Winter Air, which we do experience through a Chap, be it never so small, also the Winde ceasing: But not so in the Summer-time. For the Magnall being once made thin through heat, the air stands unmooved amongst us.

CHAP. XV.

A Vacuum or emptiness of Nature.

1. The true definition of the Winde. 2. The undistinct sincerity of former ages. 3. Whither the Authours invention tendeth. 4. An examining of the Air by an Engine like to a Hand-Gun. 5. A Vacuum or emptiness in the Air is proved. 6. A Vacuum is easier believed than a piercing of bodies. 7. A Handicraft Demonstration, by fire, in behalf of a Vacuum and five remarkable things of it. 8. A Handicraft operation concerning a sulphurated Torch or Candle. 9. Subsequent Collections from both the Handicraft Operations. 10. Pores of the Air are demonstrated. 11. Opposite suspitions are taken away. 12. Inward heat and inward fire being shut up together in a Glasse, how they act diversly into the Air. 13. That it acts more strongly by the pressing together of its smoak, than by the enlarging of heat. 14. Of what sort the sense or feeling of the Air is. 15. A new end of the Air. 16. That the fire lives not by the air, but onely is choaked through penurie. 17. Vacuities or emptinesses in the air are needfull. 18. That every thing hath hated pressing together made by its guest, by the lawes of self-love. 19. A Vacuum being an impossible thing with Aristotle, hath now become a requisite thing in nature. 20. That there is given in the Vacuum of the air, a middle thing between a body and an accident, and so, a neutrality. 21. What the great Magnall may be. 22. How the Blas of the Stars is communicated without Species or particular kindes. 23. The trifles of the Aristotelicks, concerning the Winde. 24. A ridiculous multitude and plenty of exhalations according to Aristotle. 25. The Opinion of Galen touching the Windes, is hissed out. 26. The Opinion of Galen, concerning Quick-silver, badly from Dioscorides, and worse copied out. 27. The nature of rarefied air for the confirming of a Vacuum. 28. While the air is commonly thought to be made thin, it is indeed, pressed together by reason of the extension of of its Magnall or Sheath. 29. The body of the air, hath its just extension under cold. 30. Why in a hotter Climate, the favours of the Heaven are the greater. 31. The Magnall is proved to be increased and diminished: but not the air to be properly rarefied or condensed.

IN the beginning of the Blas of a Meteor, I have defined the Winde, by a true definition, that is, by its constitutive Causes.

Seeing that a thing without, or besides the containing of its Causes is nothing, and every thing produced doth naturally shew an originall and essentiall respect unto its own producer, which is inward to it. Therefore a naturall Winde, is a flowing Air, mooved by the Blas of the Stars. And that for distinction, from a prodigious or monstrous Winde, raised up by the malice of evill spirits. Hypocrates calls the Winde a Blast; and saying, that all Diseases are from blasts, he reckoneth up his [To Enormon] or forcible blast, among the chief or first causes of Diseases. For such was the plainness, and candour or simplicity of former times, wherein, because they being more blessed, there was not yet, such knowledge, nor cruelty, nor frequency of Diseases: For all things were not granted to Hypocrates. For it hath well pleased the Almighty, since Hypocrates, to have also created his Physitians. He made known indeed to Hypocrates, that there is in us a Spirit, stirring up all things by its Blas, which Spirit, he afterwards by a microcosmicall analogie or the proportion of a little

World, compared to the blasts of the World, and restrained into the order of a blast, whether they were partakers of life, or indeed did contain the causes of death and destruction. Lastly, he left it undecided, whether they being stirred up from the Heaven, they should shew the suitable proportions of the Heavenly Circle, or at length were stirred up by a sublunary law. For the race or descent of the vitall Spirits had not yet been plainly made known. For none had hitherto learned by experience, that the matter of Gas was water, and so it had not been as yet known, that the windes of the World did wholly differ from the vitall Spirit. From the knowledge of the windes, handed forth by me in the fore-going Chapters, I now at length proceed to a diligent examination of the Air. For I have therefore said, that it is to be proved by Handicraft-operation, that water is not from the co-pressing of air, how cold soever it be: and so that they have hitherto erred in the mixing of the Elements, originall of Fountains, &c. But the Handicraft operation is true; that air may be pressed together in an Iron Pipe of an ell, about the length of fifteen fingers, at the expansion or enlarging of which co-pressed air, the sending forth of a small Bullet thorow a Board or Plank, should happen, no lesse than if it were driven out of a Hand-gun.

Which thing surely could not so come to passe, if the air by so great a pressing together of it self, under the cold or wintery Iron, were to be changed into water. For from thence have I first of all learned the matter and conditions of the air; that it should sometimes most easily sustain a pressing together, and enlarging of it self, as the sight doth shew. From whence I consequently have supposed, that by all meanes there must needs be in the air enlarged, some free space and vacuum, according to the double extension of it. Suppose thou, if from the breadth of twenty eight fingers, air be shut back under a Pipe of five fingers, without any destruction of air, it followes, that almost the fingers, and almost half of the air, are void of a body. For either of the two must needs be so, under this mechanick proof; that either absolutely, there is ordinarily granted a vacuum in the nature of the air, or a piercing of bodies in the air, being pressed together as was said.

Many surely will with me, more easily admit of a vacuum, than of an existence of divers bodies in the same place: Seeing a vacuum doth not far differ from nothing; and since the action of nothing, is more weak than the action of a doubled Being: And since nature began of nothing; it is neerer to nothing than to a double Being. And so nature doth more skirmish against a double Being: For Gun-powder over-turns Mountains, Mines and Cities: But an example of the same force is never offered in behalf of a vacuum.

But besides, I again thus prove an ordinary vacuum in nature, in the air. Let a piece of Candle be placed in the midst of the bottom of a dish, being fastened to its melted Tallow in the bottom: Let it burn, and let water be powred round about it, to two or three fingers space; but let a deep Cupping-glasse be set over the flame, the flame appearing three fingers space out of the water, so that the mouth of the Glasse set over it, may stand upon the bottom of the dish: Thou shalt straightway see the place of the air, in the aforesaid free Glasse, but the water by a certain sucking to be drawn upwards, and to ascend into the Glasse in the place of diminished air: and at length the flame to be smothered; wherein many things come to hand. First, true things. 1. And in the first place it is not to be doubted, but that the flame is a kindled smoak. 2. That that smoak is the body Gas. 3. That a smoakiness or fuliginous vapour doth ascend from the top of the burnt smoak. 4. That one part of the Tallow or Wax is easily extended into ten thousand fold as much as it self. From whence I conclude, that the place of the air, ought not to be lessened by the flame, but necessarily to be increased, unless some place in the air were empty, which is lessened. Nor otherwise doth it want an absurdity, that an Element should be brought to nothing or consumed. For indeed, a Gun, or fiery Mines or Burroughs, should not work those monstrous things of our age, nor the breakings asunder of the hardest and greatest stones in Mines, unless a small quantity of powder, being kindled as it were at one moment, did send forth ten thousand times as much flame as it self at least: which flame cannot be stayed with the former place of the Powder; it rather breaks asunder all things, than that smoak should pierce smoak, or flame, flame.

To which particulars, the extension of the air through the heat of the flame, hath access, and not a pressing of it together, as it otherwise appears to the common sort. Lastly, let a sulphurated Torch or Candle be hung up by a thred in a Glasse-bottle:

but let there be some small quantity of water in the Bottle, and let the Bottle be exactly stopped with the bark of the Cork-Tree, that nothing breath out: Thou shalt see the flame, and smoak of the Sulphur, to fill up the whole floore or space of the Bottle in which the air is, and at length the fire to be quenched: Yet that there is not made a lessening of the air, nor a sucking of the water upwards, because the water ought to be put in the place of the air, so that sucking here should make no gain, nor should recompence the defect in the air: Well indeed, because the cover being opened, a sucking is discerned. But the flame doth not so roughly stick on the Candle, that it may be for the lifting up so great a weight of water, which flame is dispersed from its Candle, by the least blast: And so the flame doth not immediately lift up the water: but a sucking being caused through a consuming of some part in the air, doth lift up the water, and for many dayes, the water remains as yet advanced, after the extinguishing of the flame.

Wherefore I have meditated, that the air hath pores or little holes, which should suffer a violent constriction of the air in the Pipe, and some certain naturall annihilation in the dish. But that the Air should be co-thickned in the Glasse by reason of the heat, flame, and smoak, that opposeth Mathematicall Demonstration. And the Instrument sheweth, that by how much the degrees of the encompassing air are measured, the heat doth enlarge, but not contract the air. Therefore the aforesaid objection opposeth the supposed position, wherein it is granted, that there is made an addition of matter in the Air, by a new matter of flame and smoak. But if it be said that there is something in the Air that is inflameable, which is consumed by the flame of the Candle; Now a new absurdity ariseth: To wit, that some body is plainly annihilated, or burnt up by the flame, and in burning up that it is not enlarged. Again, by supposing something to be wasted away; it is at leastwise necessary, that that inflameable matter be turned into nothing, or into something: But it is the property of fire, that in burning up, it doth extend every thing that is inflameable, but doth not presse that thing together: As before I have taught by Gun-powder. But if we say, that the air in the Glasse is lessened by the flame: now I have what I intended: To wit, that there is in the air something that is lesse than a body, which fills up the emptines of the air, and which is wholly annihilated by the fire. Not that indeed, as if also it were the nourishment of the fire it self: For although that thing be impertinent to this Question and place; yet that which is not truly a body, can nourish nothing. And then, seeing it is neither a body, nor a fat thing, it cannot be inflamed, kindled, or wasted or consumed by the fire. Then also I will demonstrate in the Chapter of forms, that the fire is not a substance: but that which is not a substance, doth not require to be nourished. Lastly, seeing the Air is an Element, and a simple thing, it cannot admit of composition, or a conjoyning of divers things or Beings in its own nature: Nor are there in the essentiall substance of the Air, diversities of parts, some whereof may be consumed by the fire, but others not. For therefore, if the fire had found a part in the Air capable of inflaming, the whole Air being kindled, had even by one onely Candle, long since perished: For neither had the fire ceased, if having need of nourishment, it had known that to be in the Air which was neighbour to it: Yea, if the Air could be burnt up by the fire, the Air should passe over to some more simple and formerly Being, and should cease to be an Element: for the flame of the Candle should be before the Element of the Air, and more simple than it. Therefore it is manifest, that the flame in the aforesaid Glasse, although in respect of heat, it enlargeth the quantity of the air; yet that naturally, it will have its smoakes entertained in the hollownes of the air, so far is it, that the air doth extend it self: and this is the one onely cause of the diminished space in the air, whence the flame is also consequently smothered. For the heat that is externall to the Glasse, seemes to enlarge the air in the Glasse: but the fire within, by reason of its smoakes, doth actually stir up a stifling and pressing together of the air. Therefore the heat doth by it self enlarge the air, as appeareth by the Engine meating out the degrees of the encompassing air: but the fire by reason of its smoakes, presseth it together.

And so it followes, that smoakes do more strongly act by pressing together, than heat doth in enlarging: And then also that smoaks are more importunate or inconvenient to the air, than its own naturall vacuum, yea than is the enlarging of its own vacuum. Seeing that the enlarging of the space of the air, made by heat, is delightful to it, in respect of compression caused by smoakes. For from hence I con-

jecture, that all particular members of the Universe, have a certain sympathetical feeling.

14 And so, seeing the air essentially hath porosities or little hollow spaces, it grieveth it, that they should be filled up, and over-burdened by a strange Gas. Yet unless the air should have empty porosities (at leastwise the Doctrine of naturall Philosophy founded upon a vacuum negatively, falls) bodies could never admit of an enlargement of themselves, or of a strange Gas: because by the changing of them into Gas, they should require a thousand fold bigger capacities, and so room would fail for the breathing out of belching blasts.

15 Therefore the air was created that it may be a receptacle of exhalations; wherefore also it must needs have an emptiness in its pores: yet it receiveth those exhalations, by its set and just proportion: and where it hath its emptiness filled up to a just measure, the air fleeth away, and in its flight, it forceth or gathereth all the flame into a Pyramide or Spire. But if the air being detained from its flight, be loaded with too much smoak, it straightens it self, and extinguisheth the fire, which fills it self with smoak above due measure.

16 These things have not as yet been thorowly weighed by the Schooles, and therefore they have thought, the fire to live, and be nourished by the air, neither have they proof for this, unless on a contrary sense; because fire being stopped up with air, is straightway smothered. But that Idiotisme of the Schooles doth sufficiently make it self manifest: Seeing the fire is not a body, for as much as it is fire; nor is it a creature of the first constitution, for neither doth it live, nor is nourished, the which is like unto death. Even as shall be manifested concerning the birth of forms. But the Air is a simple Element. For neither doth the stifling of the fire presuppose a necessary life; as neither nourishment: nor is there for this cause, an increase of the fire, although it be built in an abundantly open air: neither also doth fire consume even the least quantity of air, or convert it into its own substance (which it hath none) as it were its nourishment: they are fables. For the fire being deprived of air, perisheth: not indeed in respect of denied nourishment, or of a participated life; but for want of room, which cannot contain the smoak, by the pressing together whereof, the fire being stifled, is extinguished. For after another manner, from the too much and hasty blown up air, the flame straightway perisheth, when the flame being lesse roughly fastened to the Candle, is presently taken away by a blast, and being once taken away from the Candle, it cannot have afterwards a subsistence in the air, as neither having a substance in it self. Therefore the pores of the air being filled up with smoak, they fly away, and give place to another air coming to them, that they may also receive their juyce or moisture from Gas: Which flight of the air, stirs up, as also requireth winde. In the Salt pits of *Burgundy*, a plain Earthen pot being filled up with water, and placed nigh the grate of a Furnace, doth far sooner freeze, than any other which is set out in the open air and frost, by reason of the continuall Flux, and passing over of the air, which by the Schooles, hath been rashly thought to flow thither for the life, or nourishment of the flame. Therefore the empty places of the Air are moderately filled: but if they are over-loaded, the space of the air doth presently straighten it self, and shuts it self up in a narrower room, the empty porosities being consumed, that it may by stifling the exhaling fire, divert it from its enterprize. That thing is inbred in all created things, through self-love. For neither otherwise doth water incrust it self in Ice, than that it may not be snatched away by the cold of the air into Gas.

17 There are therefore necessary vacuities or emptinesses in the Air, that according to their capacity, they might entertain the fluide vapours that are to be evaporated, for whose sake, the air hath seemed to sustain a pressing together, and enlarging. For else, a vacuum of the air being taken away, the least motion should move almost the whole Universe, through its continuity or un-interrupted joyning, and exhalations soon arising, the mortalls that are near being choaked, should go to ruine, no otherwise than as doth very often happen in the burrowes of Mines: Where those that dig Mettalls are stifled, not through want of air abounding, nor also alwayes through a choaking poyson: but especially, for that, the air in the Burrowes, being filled by the Gas of the Minerall, is not renewed. And so from hence it also happens, that the Lights, and Lamps, are presently of their own accord extinguished, together with the diggers.

Wherefore

Wherefore they do beat the Burrowes very much, and do draw out the air that is filled up with the exhalation, with divers Engines, and powre on them, and inspire into them, new air. But the air doth refuse too much exhalation, no other wise than as the water doth of the air, and any other thing violently coupled with it in the same Mine. Let there be a brassen Bottle; in whose bottom let the water be *A*, the air *B*, the neck *C*, the hole of the Bottle *D*, by which with a Sypho or Pipe, the air may be strongly snuffed up. But then let the neck be rowled about, that it may violently withhold the air under it. I say therefore, that while the neck is again swiftly rowled about, that it gives utterance to the air; For it shall not onely snuffe up the air *B*, that is pressed together, but also together with it, *A* shall wholly fly upwards with a great force. The air therefore, doth sustain an involuntary co-pressing of its emptiness; therefore it also brings up the water *A*, with it, which surely sheweth that a vacuum is more pleasing than the pressing together of the air; because it is that which approacheth to the involuntary penetration of a body. Now therefore, of a vacuum, an impossible thing with *Aristotle*, is made a thing ordinarily required of nature.

Notwithstanding, those porosities of the air, however they may be actually void of all matter: nevertheless they have in them a Being, a Creature; that is, some reall thing, not a fiction, nor a naked place onely: but that which is plainly a middle thing, between a matter, and an incorporeall Spirit; and neither of the two, I say, of the number of those things which in the beginning of the Chapter concerning forms, I have denied to be a substance, or accident. It is the Magnall or sheath of the air, the which seeing it hath not in created things, its like, therefore it refuseth to be made manifest by that which is like unto it.

The Magnall indeed, is not Light: but a certain form assisting the air, and as it were its companion, and as it were conjoyning to it by a certain Wedlock: An assistant I say, not conjoynd to its essence, and therefore an associate in its pores: To wit, by this, the Blas of the Stars is immediately and without hinderance extended on every side, and by a momentary motion: but not by a thousand generations of a thousand kindes, finished as it were at one onely moment, as oft as the light, or heavenly influences do strike inferiour bodies. These very things are the fables of the Schooles, to wit, least they should be compelled to grant one accident to passe over from subject into subject, they had rather that a thousand generations of a thousand particular kindes of light should be made in an instant, while the Sun doth at so far a distance shake his beams at us. For that which the Schooles do in this respect determine to be as an impossible thing, I will teach to be the ordinary course of nature, in the entrance of *Magnum oportet*. Now therefore the natures of Gas and Blas are sufficiently manifest, and which way Blas may descend unto us. The Doctrines of the Schooles concerning the windes are to be added.

First of all, the Schooles of *Aristotle* do teach, that the winde is a dry exhalation, (but not an air) lifted up from the Earth by the vertue of heat; the which, when it is hindered by a Cloud, from climbing upwards, it, as furious, runneth down sideways, and effecteth the strength or force of so great an heap or attempt. As if it had lost its antient lightness, through the first repulse of the Clouds, and that therefore being mad, it runs down sideways! as if there were a continuall co-weaving of the Clouds, nor should there in any wise be granted any entrance, and any passage to the climbing exhalation, being once repulsed by so small a Cloud! as though a Bottle filled with air, and pressed down under the water, but ascending, should finde a hand against it, and therefore should run down sideways thorow the water! and as if it had lost its former endeavour upwards, for the future; so as having forgotten to climbe upwards, although it should not finde a continuall Cloud, it should wish thenceforward, rather to be carried sideways! For neither have they considered, that the side motion of the windes ought to be broken or weakened, and also of necessity to be more feeble than its motion upwards: and so that the winde is more able to beat down high Towers, than to remove or scatter the vaporous Cloud about it. Surely in all things I wonder at the subscribed sluggishness of the Schooles, through a custom of assenting. For *Aristotle* writes, that the Salt of the Sea (which notwithstanding he thought to be co-eternall with the World) hath its originall from an exhalation (he understood not an exhalation in the least) because it is that which is volatile or swift of flight, and the Salt of the Sea a fixed body: for neither can Sea water, otherwise sweet, fix the volatility or swiftnes of an exhalation any more, than

than *Sal Armoniac* it self) also all Meteors, and especially winds, yea the Earthquake, and Comets (whereof that of the year 1618, was a thousand times bigger than the Earth) likewise small Stones, Rocks, great Stones, he hath dedicated to exhalations alone. A fuitable Store-house whence so great exhalations should proceed, hath been wanting to his Dreams. And nevertheless, the Schooles subscribe to those trifles, nor do they awake out of their drowsie sleep, but while *Aristotle* doth expressly spurn against the faith.

- 25 But *Galen* thinketh, the winde or blast, to be vapours lifted up out of the water and Lakes, by the force of heat: but now and then, that it is an air resolved out of a mixt body: But both of them, he saith to be cold, being likened to decrepitate age, to inbred heat failing, and to cold effects: surely he stumbling in all, and every thing, hath hugely spread his childish Dreams for truth. For in the time of *Galen*, the art of distilling was not yet made known, who never saw Rose-water, as neither Argent-vive or Quick-silver. For he had badly read *Diascorides*, together with *Pliny*; he writing, that Quick-silver, by reason of its great weight, cannot be detained in Leather, not in wooden Boxes, but is to be kept onely in Cases of Metall: As if one onely ounce thereof should weigh more than an ounce of Lead. Wherefore *Galen* must needs have been deeply and heartily ignorant of the deepest things of Philosophy, and of the most inward principles of nature, and of the feminall resolutions and exhalations of any properties whatsoever. At length, to shew an emptiness in the air, it is convenient more deeply to search into the thingliness or nature of its rarefying and condensing. For first of all, whatsoever I have hitherto spoken concerning the rarefying of the air, that I confesse hath been done for the capacity of the common sort: else, to speak properly, although the air may seem to be pressed together, and to be enlarged in the space of place: yet rarefying it self doth not belong to the air its self; that is, that the very body of the air may be made thinner than it self, in the same manner, wherein a vapour is made of water. Because I have already divers times shewn, that a vapour is a Cloud of the atomes of the water rent a sunder from each other by the middle parts of the air interposing, and that therefore the water in the vapour doth also alwayes remain water; neither that it suffers any thing besides the extension of it self, and division into atomes, made by its seperation. For if the body of the air be therefore made thin; this should be, either as it should be changed into another body more slender, thin, and simple than it self, which is to feign a new and unheard of Element, actually cold, thinner than the others, and more simple than the air: Or the air should be made thin by the seperation of the atomes, and the interposing of another unknown body; and then the body coming between, should admit of degrees of thinness. And therefore the rarefying it self, should not be so much referred unto the air, as unto the unknown body coming between. Nevertheless rarefying is not of the air, but in the air; and that not onely by reason of admitted smoaks (as in the Handicraft operation of a dish) but through a naked quality of heat (as is manifest by the Instrument meatting out the qualities of the encompassing air) therefore as oft as rarefying doth appear in the air, it must needs by all meanes happen through an increase of the Magnall: Which founds, that a vacuum being increased in the air, the pores of the air are enlarged and extended; and so, so far is it, that by reason of heat, the air by it self, and in its own body doth sustain a rarefying, and that the body of the Element is changed: that rather it is coagulated, at least is pressed together, and that the little holes of the vacuum, do extend themselves, or that the Magnall it self is multiplied in the air. Wherefore there is also an improper speech, while we signifie the air to be rarified by it self, when as rather it is thickned or pressed together by it self: but the Magnall that is co-bred with it, is therefore extended. But from what hath been said before, is deducted, that the body of the air is under cold, brought unto its just extention. And again, that which followes from thence is, that cold is naturall or pleasant to the air: But that the Magnall is contracted under cold. But as oft as the Magnall is straightned, the wayes or passages of the Stars to us are straightned. And hence it is plainly to be seen, why the Land of promise is very hot: that is, why in the more hot Zone, there are the more happy contentments or neernesses of alliance of the Heaven with the earth, the more plentiful fruits, and the more savoury ones: Therefore the Magnall is like light, and is easily made, and easily brought to nothing. For that which is in it self the vacuum of the air, is almost nothing in respect of bodies. For it came forth from nothing, also it may

may be reduced to nothing: But not but against the will of the air: because it hath need of this vacuum. Alas! how nigh to nothing is all nature, which began of nothing. In the aforesaid Instrument meating out the encompassing air, by the heat or cold of the Sun, the place of the air is seen to be greater or lesse: but we perceive, that at the rarefying of the thing contained, the air is expelled: whose breathing place, if it then be shut up for want of air, a sucking is felt. Therefore by more fully looking into the matter, the vacuum or Magnall of the air, is increased and lessened; but the Air is not rarefied. So also the condensing or pressing together of the Air, is not in respect of its body: but onely of its Magnall or Sheath.

CHAP. XVI.

An Irregular Meteor.

1. The Mysteries of the Rain-bow, and the Images of the Sun. 2. That before the floud there was no Rain-bow. 3. That the Rain-bow was given for a signe of the Covenant; yet that the cause thereof is not yet known. 4. Tet the Rain-bow doth daily bring its own Covenant to remembrance. 5. The Mystery of the Covenant is as yet under the Rain-bow. 6. In what thing the Rain-bow doth denote the end of the World. 7. The dotages or toys of the Schooles concerning the Rain-bow. 8. Things required of the Schooles. 9. That the Rain-bow hath not its Colours immediately in a Cloud, but in a place. 10. That the Rain bow is of the nature of Light. 11. The existence of Colours immediately in place, is proved. 12. The Object of the sight is immediately in Place, the object of hearing is immediately in the body of the Mean. 13. Creatures of neutrality do subsist immediately in place, without a body. 14. Paracelsus concerning the Rain-bow is refuted. 15. The frequency of a Miracle doth not reduce that miracle into the number of nature. 16. Some supernaturall things are ordinary. 17. An Atheisticall, and childish opinion of the Schooles, concerning Thunder and Lightning. 18. Wonderfull sights or visions in high mountains. 19. The spiritall noyse or cracking is the Blas of the evill spirit. 20. A Historie of Thunder. 21. The noyse of Thunder, how it putrifieth. 22. Outward Salt preserveth.

I Have said that Meteors do consist of their matter Gas, and their efficient cause Blas, as well the Motive, as the altering. But the Rain-bow is irregular, a divine Myserie in its originall. I judge the same thing of the Parelia or Image of the Sun, whereby two or three Suns do appear at noon-day alike equally clear or light-some. But for Thunder, it doth not alike include a Myserie and monstrous token. We being admonished by the holy Scriptures, do believe by faith, that the Rain-bow was given for a sign of the Covenant between God and mortall men, that the World should no more henceforward perish by waters.

For first I draw from thence, that the Rain-bow was never seen before the Floud. Otherwise mortalls had justly complained: For we have oftentimes already seen the Rain-bow, and yet the World hath perished by a deluge: what safety dost thou therefore promise us by an accustomed Rain-bow? this Covenant is suspected by us, it takes not away our fear. The Rain-bow was therefore new to the World, when it first appeared for a sign of the Covenant: Wherefore, mortalls were amazed at that unwonted Being, and being (otherwise incredulous) gave credit.

Secondly, From hence I learn, that the Rain-bow was given for a meet sign: wherefore, neither that it hath even to this day, any reason of a cause, with relation to any effect.

Thirdly

Thirdly, seeing now the World before the flood, had been about two thousand years old, and yet there had been causes in nature, which to this day, the Schooles do attribute to the Rain-bow; yet there was no Rain-bow: Surely that convinceth of the falshood of those causes. Whence at length in the fourth place it followes: That unless the Rainbow be also at this day, for a sign of the Covenant, and for the sake of its first appointment, it otherwise appears for a frustrated purpose. Therefore also the Rain-bow doth now and then remember us of the Covenant once stricken, that we may believe, and alway be mindfull, that God the avenger on sinners, sometimes sent the waters, that they might destroy every Soul living on the Earth, that the same God might be a conscious or fellow-knowing revenger and Judge of our sin. For all flesh had corrupted its way by luxurie, which ought to be choked by waters. By the Rain-bow therefore, God will alway have us mindefull of threatned punishments, who by this sign doth signifie, that he is the continuall President or chief Ruler, & the Revenger of nature. But that the *Rainbow* might signifie, that the *World* should be no more drowned with waters, it was meet that it should bear before it, not indeed a certain unwonted spectacle in the air, without difference to any other thing: but the mystery of the promised Covenant, ought to lay hid in the Rainbow, which might declare the promise and belief of the thing promised, by a signe. Surely I seem to my self, to admire with *Noah* three colours in the Rainbow, and the pleasing splendours of three Sulphurs shining forth in co-burnt Minneralls.

And so the Colours do give testimony, that the Earth being the womb of Minneralls, is at length to satisfie the wrath of God, by the extream melting of the burning of her Sulphurs. Therefore the Rainbow doth not henceforth p̄fage water, but fire. I wonder at the Schooles, who will not hearken to the truth of the holy Scriptures delivered; but that they even to this day, proceed to make young men drunk with heathenish toys or dotages. For they hand forth, that the Rainbow consisteth of a twofold Cloud, to wit, one being deeper and thicker, but the other being thinner, and moreover extended over that other, that in manner of a Glasse, it may resemble the Sun from the contrary part. Verily it is a vain devise, like unto an old Wives Dream. For I have sometimes kicked the lower part of a Rainbow with my feet, and have touched it with my hands: and that not onely in Cloudy Mountains, but in an open and Sunnie-field. And so I have certainly known by my eyes, hands, and feet, the falshood of that supposition: Seeing that, not so much as a simple Cloud, was in the place of the Rainbow. For neither, although in the morning I did cleave the Rainbow, and drew it by the colours of the Rainbow, have I perceived any thing, which is not every where, on every side in the neighbouring Air. Yea therefore were not the colours of the Rainbow troubled, nor suffered confusion.

The Schooles ought at least to declare, why it should have alwayes the figure of a Bow, or Semi-circle, but never the resemblance of a Glasse. Why if it be the Image of the Sun reflex, doth it not shine in the middle of it selfe: seeing the *Parelia* shines like the Sun, with an undistinct and ruddie light? Why should those two Clouds be alwayes folded together with the equall form of a Bow, and variety of Colours? Why doth not the Glasse that is against the Sun, represent those Colours, if that double Cloud be in the room of a Glasse? Why doth not that doubled Cloud, at least in its more outward and conjoynd part, change the wandring Latitude of the Clouds, if its hollow part be pierced with an abounding light of the Sun declining or going down? Why doth a Rainbow also appear, the Sun being hid under the Clouds, and no where shining? Why doth the Sun I say, paint out alwayes those uniform and various Colours, and so neerly placed together, and not one onely Colour, according to the simplicity of its own light? Wherefore do many Rain-bowes now and then appear together in one field? For truly, in so vast a Circle of the Air of the Horizon, the reflexion falls not in one or two miles: but the Cloud opposite to the Sun, hath not its reflexion directly, unless on the opposite part answering to it self in the Horizon; but not on the part near to its side. Lastly, it is absurd, that the upper and thinner Cloud which is void of Colour, and which the light of the Sun doth easily pierce, should fashion Colours in the other thicker Cloud, which neither the Sun, nor either of those Clouds have in themselves. Surely I have very much admired at these vain positions of the Schooles, whileas I should handle a Rainbow with my hand, and should see no Cloud at all round about.

about. Wherefore I have noted that the Rainbow by a peculiar priviledge, hath its Colours immediately in a place; but in the Air, by the place mediating: And so; I have taken notice, that those Colours, and the figure of the Rainbow, in their manner of existing, are of the nature of light: That is, the Winde blowing, the Colours which are immediately in a medium or mean, do walk together with the mean, and are disperfed, according as the mean in which they are, is: but the Colours or Lights which are immediately in place, are not changed, although the Air or Mean in which they appear, may change its place, and flow. So neither the winde blowing, doth the Rainbow perish or walk.

For from hence it is; that the object of sight is at one onely instant brought to the Eye: but the object of hearing, because it is not immediately in place, but in an Air placed, doth presuppose a durance of time and motion. Wherefore the Rainbow not onely is not in a Cloud: but moreover, not indeed in the Air, but immediately in place; but in the Air immediately, to wit, as this is in a place: For so, the light of the Sun doth the more swiftly strike it self in an instant, even unto the Earth, because it is immediately in place, but in the Air mediately, to wit, as this is in a place. But that the Sun is the cause of the Rainbow, that I believe is naturall; but that a Bow, immediately in place; is appointed to be so coloured by the Sun, but in no wise in the Air, that hath the force of a sign. For the Schooles have hitherto been ignorant, that Light and Colours can subsist, unless they do inherit or stick in some certain substance. But it is no wonder; for truly they have not known some Creatures, some whereof they have brought back into a substance, (to wit, the fire, substantiall forms, &c.) but others they have surrendred into meer accidents (as the Rainbow, Light, the Magnall, &c.)

The which notwithstanding I shall demonstrate in their place, to be created things of a neither sort: But let it be enough to have said it, in this place. But if the Rainbow should be immediately in the Air, and not in a place; it must needs be, that by any little winde, it should straightway flow abroad, and be puffed away by blowing, together with a Cloud, or the Air: which is false in the Rainbow, the which doth also remain a great while under the Windes, sometimes without any presence of Clouds, and yet in the same constant figure of a Bow or Semi-circle: therefore the Rainbow seeing it is immediately in place, it is a new figure of a coloured Light. Indeed the Rainbow began supernaturally, for a Sign and Mystery of the Covenant struck with Mortalls: and since it hath at this day its Root in the Air, without any matter, yet after the manner of naturall things; I do reverence its efficient cause, and its presence, and do ponder with my self, that the Rainbow is at this day given for a Sign of the Covenant, even as in times past. Paracelsus supposeth the Rainbow to be the *Evestrum* of the Sun; but the *Evestrum* he calls the Spirits or Ghosts of men. The which from the absurdity of it self alone, as sufficiently rejected, I passe by. For truly the Sun hath neither a Soul, nor (being as yet alive) hath an *Evestrum* after its Buriall. There are some, who will laugh at me, for these daily Miracles.

But certainly, while I do more fully look into things, I see divine goodness to be actually, alwayes, every where, and immediately President or chief Ruler: because, all which things, he in very deed, even from end to end, reacheth to, strongly, and disposeth of all things sweetly. For in God we live, are, and are moved, in very deed, and act: but not by way of proportion, or similitude. For truly, when the Lord the Saviour said, *I am he*, to wit, by whom ye are, live, and are moved, he withdrew onely, that his power whereby they were moved, and straightway all the Souldiers fell on the ground. And although the Instrument in nature whereby we are moved, be ordinary; yet there is another principall, totall, and independent cause of our motion, and the originall thereof, being a miraculous hand, doth concur in every motion. So also in the Rainbow, the Sun, and place do concur as it were second causes: Yet there is another independent, totall, miraculous and immediate cause, which hath directed the Rainbow to the glory of his own goodness, and of the Covenant stricken, not onely indeed with *Noah* and his Family; but with the Sons of men his posterity, even to the end of the World. And so from the same originall, and for the same end for which the Rainbow began, it is promised to endure as long as Mortalls shall be: and seeing it is a sign of the Covenant with the Sons of men, but not onely with the Sons of *Noah*, it also includes a certain Covenant or agreement. Therefore there is a miraculous thing in the Rainbow,

bow, that its colours are not in any body; but immediately in place it self, like light, and that immediately from the hand of God, without the concurrence of a second cause: Nor is it a wonder, that from the condition of the Covenant, a supernaturall effect should interpose: Because that in many places, continuall miracles do offer themselves.

- 17 Therefore as the Rainbow is a sign of an everlasting Covenant, and a Messenger of divine goodness; so Thunder causeth an admiration and adoring of the power of God. For there is nothing in the Catalogue or number of things, whose rains, the Almighty Creator doth not immediately rule. Surely he every where inforceth his love and fear, and so will have man to be ordinarily put in minde of his power. According to that saying, *The Voyce of Thunder hath stricken the Earth.* For a sudden and monstrous Blas is stirred up in the Air. The Heaven is oft-times clear, straight-way also, being without winde, it is suddenly bespotted with a black Cloud: For often times it thunders, the Heaven being clear without any small Cloud: And so, Thunder doth not require a Cloud; but if it doth suddenly stir up any, it is made, as the cracking noyse shakes the Peroledes, and as Gas settles downwards, into a thick Cloud, being drawn together by the cold of the place. Therefore the Doctrine of the Schooles is frivolous, determining, that an exhalation is kindled between the sheath of the Clouds, that it dasheth forth Lightning, and that there are so many
- 18 rentings of that Cloud, as there are sounds and cracking noyses. For I have seen in Mountains, wandring Clouds, and most cold in the touching; yet none of any firmness, or strength, that they being discontinued, can utter so great a noyse, or cast down Lightning of so great a power, by a mooving downwards, and with so violent a motion, and that besides the nature of ascending fire. I have seen, I say, Lightnings about me, and have heard Thunder also under my feet. Notwithstanding, I have even least of all discerned those firmnesses of Clouds, and trifles of Thunder. I say, I have seen Lightnings and Thunders diversly to play under my feet, where at first, there was no Cloud; and a Cloud to descend, as if it had been called to them by the voyce of the Thunder. And so I have beheld Lightning, with a magnifying of the Divine Power, but not with fear, although I have been twice in a house that was smitten with Thunder. For I, by so much the more admiring, have prayesd the magnificencies or great achievements of the Lord, by how much the nearer his effects were unto me. I have seen also once, nigh *Vilword*, and again at *Bella in Flanders*, a certain black Sheath, as if it were a long Horsmans Boot, to fly among the Groves of Oaks or Forrests, with a great cracking noyse, having behinde it, a flame, as it were of kindled straw: but great Snow succeeded it. Therefore, seeing Thunder hath no cause plainly naturall in the Clouds of a Meteor, I believe that it hath wholly all its cause, not above, but besides nature; and so that it is a monstrous effect.

For first of all, we are bound to believe, that the evill Spirit is the Prince of this World, and that his Principality doth not shine forth amongst the faithfull, unless onely in the office of a tempter: For so it is said, that the *Adversary as a Roaring Lyon, goeth about, seeking whom he may devour*: but that, not from the office of his Principality. Therefore he hath obtained the Principality of this World, that he may be a certain Executer of the judgements of the chief Monarch, and so that he may be the Umpire or Commissioner of Thunder, and Lightning; yet under covenanted Conditions. For his Bolts being shaken off, unless his Power were bridled by Divine goodness, he would shake the Earth with one onely stroak, and would destroy mortall men.

- 19 The cracking noyse therefore, or Voyce of Thunder, is a spirituall Blas of the evill Spirit, surely an effect of great strength. But Thunder is not conjoynd with a Miracle: but it contains a monstrous thing in Nature. So moreover, although the fire of Lightning, be naturall; yet the manner and mean are divelish Powers. For God, as a most loving Father, will be loved in the first place: but by himself immediately, he doth not willingly cause or inforce feares: because it belongs not to his goodness to be loved from the fear and fearfullness of pain or punishment. Therefore the terrours of his power, and angrv feares of his Majesty, he causeth or enforceth not but by appropriated spirituall Sergeants, his Ministers, that is, by a terrible Spirit. And that thing all Antiquity hath alwayes judged with me, which hath declared *Jove* or *Jova* (as much as to say with the *Hebrews*, *Jehova*) to be the God of Thunder. Seeing the Lord and Father of things, doth unfold his Thunder by the bound

bound hand of a tormenter; the evill Spirit thereupon, would not indeed be contented with the Title of Prince of the World; but would have the name *Jehova*, to belong unto himself. Therefore Thunder and Lightning, although they may have concurring naturall Causes; yet the moover of them is an incorporeall Spirit. *Atheists* may laugh at my Philosophy, who believe, that there is no Power, or God, and no abstracted Spirit: But at leastwise, they cannot but admire at the effects of Thunder, and accuse themselves of the ignorance of its causes.

One History at least I will tell, among a thousand. *In the year 1554, in the Coast* 20
of Leydon, the Tower of Curingia being taken away by Thunder, no where appeared: after fifteen dayes, a Grave is opened in a Herbie Plot of Grasse of the Burying place, wherein a Shoemaker was buried, and behold under an unmoored and green Turf, first the Brass Cock with the Iron Crosse, appeareth, and then a Pinacle of the Tower, and at length the whole Tower is digged out. I have seen, my self being present, by one onely Thunder-clap, some thousand of Oaks and Hazels to be burnt up, in their first bud and leaves; to wit, the whole Wood being named from a place neer *Vilword*, where the Birch, the Beech, and Alder-Tree, being frequently co-mixed with other Trees, in a thick confusion, had the mean while remained unhurt by the Thunder. But elsewhere, by one onely stroak, he strikes many things at once, that were far distant asunder. For who can sufficiently unfold the thousand various crafts and wiles of the cunning Workman? It sufficeth, that many spirituall actions do concur being divers from the ordinary course of Nature, they being also alike powerfull at a distance, as nigh at hand.

Therefore that terrible Voice of Thunder, striketh the Earth, kills Silk-worms, 21
shakes Ale or Beer, and constrains it to wax dead, causeth the flesh of a slain Oxe hung up, to be flaggie, it curdles Milk by the sudden Leaven of its founnels, &c. But Salt applied without, to the brim of the Hogs-head, or Earthen-pot, doth turn away such kinde of effects. Surely a weak resister for such an agent, if in nature the thing resisting ought to prevail over the agent. But why? the evill Spirit hateth Salt, and therefore Salt is alwayes said to fail or be wanting in his Sabbaths of his Imps: he 22
being sufficiently expert, that Salt is adjured for holy water, as oft as the Baptizer useth Salt. Also Salt that is not blessed, may trample upon his commands. If therefore the Tree is to be known by his fruits, therefore the Authour by his Works; and so much the rather, because so weak remedies do resist so great strength. Nor surely doth that make to the contrary; that God appearing to *Moses* in the Mount, in continuall Lightning and Thunder, environed the Mountain before *Israel*: Yea rather it is thereby confirmed, that the cracking Thunder, and Lightnings, do belong to Spirits his Ministers, to Spirits I say, his tormenters and executioners: For truly, *Israel* was driven away from ascending the Mountain under pain of death: For neither therefore were the Thunders in the top of the Mountain, but beneath, round about the Mountain: neither also appeared the Almighty to *Elijah* in the Whirle-winde, or in the strong Winde; but in the sweet Air. As an addition I will hitherto referre the Decree of the Church, which in the blessing of a Bell, doth prescribe certain forms, wherein it confirms the same Presidentship in Thunder, which I have prescribed in this Chapter. For in the words of their adjurations, they have it. Let all layings in wait or treacheries of the enemy be driven far away, the crashing of Hails, the storm of Whirle-windes, the violence of Tempests: let troublefome or cruel Thunders, Blasts of Windes, &c. be allayed. Let the right hand of thy power prostrate Aery powers, and let them tremble and flee at this little Bell of the hearer. Before the sound thereof, let the fiery darts of the enemy, the stroak of Lightnings, the violence of Stones, the hurt of Tempests, &c. be chased far away. Whence indeed, all adjurations do conspire against Tempests. For, Hail, Winde, Rains, Clouds, &c. are Meteors of Nature: but a tempestuous darting, exceeding the fall of a Body in grains and the flowing of the Winde, are understood to be done by malignant powers. These things indeed, concerning Tempests of the Air, Hail and the Sea, are thus confirmed: but in Thunder, not onely the very casting of the Thunder-bolt, or Stones; but moreover, the cracking noyse of Thunder, doth depend on the powers and enemies of the air: because that no renting of the Clouds, or Air, can naturally utter such noyses, and the effects of these, unless monstrous and hostile Powers do imingle themselves, and play together.

CHAP. XVII.

The trembling of the Earth, or Earth-quake.

1. The name of the Moving of the Earth, is improper.
2. The opinion of Copernicus.
3. A shew of the Deed.
4. All Schooles do agree with Aristotle in Causes, for 21 Ages hitherto.
5. The Opinion of the Schooles is demonstrated to be impossible, from a defect of the place.
6. The same thing may after a certain manner be drawn from the force of exhalations.
7. Likewise by the Rules of proportion and motion.
8. The rise or birth of exhalations, their quantity, power, progress, manner of being made, entertainment, and swiftnes, are all ridiculous things.
9. All these are demonstrated to be impossible things.
10. The cause of their Birth is wanting.
11. It is proved by the Rules of falshood and absurdities.
12. That those trisles being supposed according to the pleasure of the Schooles, the manner is (as yet) impossible.
13. That an exhalation being granted according to their wish, yet an Earth-quake from thence is impossible.
14. Rentings asunder or disruptions for fear of a piercing of Bodies, do differ from that which might happen through the supposed gentleness of exhalations.
15. An impossibility is proved, from the nature of the composition of exhalations.
16. Those things are resisted, which were granted from the connivance of a falshood.
17. Wells and Caves, are all the year, in their depth or bottom, of an equall temperature.
18. That there is no fiery exhalation, as neither a fiery Gas.
19. An exhalation cannot lift up the Earth with its lightness.
20. A Bladder filled with Air, doth not spring up out of the water efficiently, by reason of its lightness, but occasionally.
21. Weightiness is an active quality; but lightness, seeing it hath no weight, doth signifie nothing.
22. Three remarkable things drawn from thence.
23. That the manner of an Earth-quake delivered by the Schooles, is impossible.
24. The ignorance of the Schooles concerning the properties of lightness.
25. A faulty Argument of the Schooles, from ignorance.
26. After what sort the Schooles are deluded in this thing.
27. A new Sophistry by reason of errorrs.
28. An Earth-quake declareth monstrous tokens.
29. The Earth trembles, being shaken by God.
30. The one onely cause of an Earth-quake.
31. An objection of a certain one, is resolved.
32. The Earth doth not feel or perceive after an animall manner.
33. What an Earth-quake may properly portend.
34. Sacrifices for the purging of offences, do differ according to sins.
35. The proper inciting cause.
36. What an Earth-quake in the Lords Resurrection, denoted.
37. An answer to a friendly objection.

1 **B**eing to speak of the Earth-quake, its Causes, and ends, will first of all, begin with its name: It is wont to be called, a Moving; but it seemes to me, to be a name too generall, and very improper: For truly, while the Earth, or any other heavy Body doth hasten downwards; it is said to move it self; so that water flowing moves the Wheel actively: but in an Earth-quake, the motion seemes to be passive, and so by accident, as improper to it.

2 **N**icolas Copernicus, by very many fictions, doth contend, the Earth to be circularly moved, with the Orbe of the Moon: and seeing that no motion is proper to a Globe, but a Sphericall or round one, and that doth not agree to the Earth, according

ing to the Decree of the Church; therefore I have withdrawn the name of Moving, from the Earth, and have changed it, to wit, that it being rather fearfull, is said to tremble. For truly the Earth being passively smitten, or threatened by a certain huge force, it is as it were jogged or shaken through fear and horror, but doth not leap or skip for joy; because it seemeth to undergoe some cruel and horrid thing besides the ordinary course of nature.

Therefore the name of Quaking, being first established, next the shew of the deed comes to hand. For truly, there was a night, between the third and fourth day of the second month called *April*, in the year 1640, indeed a quarter past the third houre after midnight, the Moon being at full, two dayes after that time, and it being the fourth day of the week called *Wednesday*, before *Easter*, when as *Mecheline* (where I then was by reason of some occasions) notably trembled, and leaped with three re-iterated approaches or fits, and at every onset the trembling endured a little lesse than there might be of the space of repeating the Apostles Creed; but a certain roaring in the Air, went immediately before every fit, and as it were the action of Wheelles wherby great Ordinance are carried thorow the streetes, shooke the Earth. I say the night was fair, clear, void of Windes. For truly, for the cause of the revival then to be sifted, a little before midnight, I returned home: But I rested nigh *Dillie* in the Commendatory of *Almaine*, commonly called *Pitzenborch* (being received through the Courtesie and humanity of the famous man, the Lord *Wernher Spies* of *Bullenheim*, of the *Tentonick* order, he being Provinciaall Commendatour of the confluence of *Bullenheim*, and Commendatour of *Pitzenborch*, *Toparch* or President in *Elson*, *Herren-volke*, &c.) But I was removed for the space of seventy spaces from the streetes: And then, I learned of my friends, that almost at the same moments of time, and with the same three re-iterated turns, seperated by an equall intervall, and the same roaring accompanying them, *Bruxells*, *Antwerp*, *Lire*, *Gaudan*, the Mountains of *Hannonia*, *Namurc*, *Camerac*, trembled: Afterwards we heard, that the same thing happened in *Holland*, *Zealand*, *Friesland*, *Luxemburg* and *Gilderland*; yea, that even *Francford* upon *Menns*, no lesse trembled. That at *Mentz*, some Towers were beaten down, and that new Buildings nigh *Theopolis* fell down together: Also that *Westphalia*, yea *Ambiave*, and the nearest Coasts of *France* trembled. Truly all these places trembled at the very same instant of time, although by reason of the roundness of the Sphere, the Dials, the Messengers of dayes, did necessarily differ. It is a tract of Land, at least of three hundred and sixty Leagues, in every one of the least places of its Circle, the ground every where trembled with an equall fear. For neither was the Watchman in the most vast Tower of the Temple of *Mecheline*, any otherwise shaken, than any one that lay in a low Cottage: No otherwise I say, a borderer of *Scalds*, an Inhabitant of the Islands, and Citizen of the Medows, than they which stayed in the more high Hill. Then was the fortune of all, and every one alike. Lastly, I understood, that the Ships in the Havens of *Holland* and *Zealand* were shaken in their Masts and Sails, without Winde. Concerning the immediate Causes of so great an effect, there is much agreement among Writers. The modern or late Writers, I say, supping up the Lessons of *Aristotle*, have not gone back from thence, a nails breadth hitherto: Although they have added their own inventions to the Precepts of the Auntients. The Schooles therefore, do teach, that the Earth trembles by reason of Air, Winde, or an exhalation, gathered together in the hollow places and pores of the Earth: which seeking, and sometimes making a passage for it self, doth make the Earth to leap or dance. For from hence, it oft-times suddenly breaking out thorow gaps and clefts, hath given a rise to destructive Diseases. This is a Tradition of the Schooles, received throughout the whole World, for one and twenty Ages. Which, if it had seemed to me to be agreeable to the ends of the Divine power, I had desisted from writing: But truly, it hath seemed to me, to be sown with heavy perplexities, and an unavoidable absurdity; so that it containeth not a litle of an old Wives fable. Indeed Man-kinde doth of its own accord so incline to drowsiness, that the hope of Learning being as it were beheaded, it hath commanded all the Treasures of Sciences, being drawn out in one *Aristotle*, to have been as it were left off from a further diligent search. First therefore, I will shew the impossibility of that Doctrine; and then, I will perfectly teach my own opinion, not, stablished by heathenish Dreams, but confirmed by the Doctrine of a higher authority.

For

For first of all, the Earth is actually distinguished by certain Pavements, Soils or grounds; for truly, the outward Soil of the Earth, is plainly Sandy, Clayie white, else-where clayie-yellow, muddy, grisely or grayie, white, yellow, black, red, &c. sporting with divers varieties. Under which, for the most part is a Sand, and this very Sand differenced every where with great variety. But under this Soil, is at length the flinty Mountain (which they call *Keyberch*) being the Pavement and Originall of Rocks, and first Root of Mineralls. And at length, every where under this Soil, is the living or quick Sand, the boyling Sand, Drif, or Quellem, which is extended even into the Center of the World, being thorowly washed in its un-interrupted joyn- ing, with waters. And although all the aforesaid Soils, do not every where succeed each other in order; yet the Quellem is every where the last Pavement of the World, although oftentimes, immediately exposed to the Air, and plain to be seen. (As concerning the Originall of Fountains, in my Book of the Fountains of the Spaw.) This therefore being once supposed, I say, that the place where the exhalation should be, which is believed to be the cause of the Earth-quake, ought to be placed or appointed in some, or amongst some of the said Soils, seeing that in the Earth, there is not a place out of the aforesaid Pavements. But to the overthrowing of that Doctrine, a demonstration is required, which from a sufficient enumeration of the Pavements, may shew, that such an impossible exhalation cannot be contained, or be raised up in any of the said Soils; or if it should be there stirred up, yet that it hath not the power of forming an Earth-quake. As to the first of the three members, (to wit, that not any exhalation can be contained under the Earth, which may actively cause its trembling) I prove. First of all, not under the outmost, Clayie, or first Soil of the Earth next to the Air, and designed for the habitation of Mortalls: because so, *S. Rumolds Tower*, had not trembled, as neither Buildings built immediately upon the Quellem. As neither had Ships, without the raging of Windes, been removed, in deep Waters, far from the ground of the Sand. For it being granted, that the bottom of the Sea, did tremble, just even as the Earth else-where inhabited; yet the Superficies of the Water could not keep the tenour of the same trembligg Sand, without winde and storm: which thing notwithstanding, is discerned to be false: for flying Birds also, feeling the trembling of the Earth, would not fall down; they being as it were fore smitten or astonished; for a sign, that the Air it self doth tremble. For the Elements shall at sometime melt in the sight of the Judge. Therefore if the water doth tremble, no lesse than the quiet Earth it self, the cause thereof is signified to be in the Globe, or because the Earth and water do at the same stroak of smiting, together with the Air, feel a fear, or hand of the smiter. Secondly, neither can an exhalation, the cause of an Earth-quake, dwell in any of the Soils of Sands: because then, Fens, Medows, and places wherein the Quellem is immediately prostituted beneath the Clay, had not trembled: Which thing is as equally different from the truth of the deed, as the former. Next in the third place, neither can the same exhalation be hidden under the *Keyberch*: For in the whole Circle, a few places excepted, wherein the Earth then trembled, at the same moment of time, the ground *Keyberch* is not extant. At length, neither could an exhalation arise or be detained between the Quellem, which is sufficient to shake so great an heap with an equall fury: Because the Quellem (that is oft-times next the Air, and conjoynd even into the Center of the Universe by its continuall unity, and thorow mixture of waters) should easily pufte out such an exhalation, before it could equally lift up so great an heap at once. For it is of an unexcusable necessity; because such an exhalation should break forth, out of the more weak, lesse heavy, and lesse resisting parts: that is, in the place that is least ponderous: And so under the position of the granted exhalation, there could not be an alike trembling of all places, which resisteth the thing done. For before that the exhalation should lift up so great weights, through so vast, and various spaces of ground and waters, at once, and at one moment, it had fought, and had found out easie following, and the more weak places, through which it had made a way for it self to break out at. For otherwise, the exhalations should fight against the rules of nature, proportion, and motions, which should lift up equally, and at once, all the parts of the Low-Countries, and a great part of *Germany*.

Especially where there is not an equall capacity of every place wherein the exhalation should be entertained, not an equall fardle of the incumbent burden, or resistance of weight; as neither is there an equall awakening of that exhalation, possible to be; that at once, and almost at one onely moment, it should alike act thorow so many

many Regions: Which is to say, that it is impossible that the exhalation the Mover of the Earth-quake, being granted, there should be an equality in the sameliness of time, and power of motion, through so great a space, through so great a difference and resistance of the Soil, and of the Heaven, and diversity of weight; seeing such an acting exhalation, meeting out its efficacy by the variety of places, difference, greatness, activity, swiftness of the Mover, being of necessity unlike, ought also to obey the unlikenesses of places.

Therefore let the quantity, rise, power, entertainment, and swiftness of exhalations be ridiculous, which should at one and the same moment, after a like manner, and re-iterated course, shake so many Cities, Mountains, Valleys, Hills, watry places, Meadows, Rivers, Islands, and so vast a heap, longly, and largely displaced, and sooner, than it should seek, finde, and make a passage for it self.

But now I coming to the second Member of proving; to wit, that in the afore-said Pavements of the Earth, the raising up of an exhalation is impossible, which may be the cause of an Earth-quake: Let every kinde of naturall vapour be determined and examined by its causes. The exhalation, which may be supposed to be the Mover of the Earth, is not in the first place, a vapour, or watery exhalation; because that most swiftly returns again into water daily by pressing together, of its own accord, in our Alembicks: but an exhalation according to *Aristotle*, that is chiefly necessary for these bounds, is a hot and dry flux, or Issue out of Bodies (for the most part also Oylie) lifted up from the dry parts, by a sharp heat into the form of Air, or a rising smoak.

But I could wish, that the Schooles may answer, what therefore at length, shall that actuall, equall, and connexed heat, under the Sea, Rivers, pooles, Meadows, and under the Quellem, be? For truly, it behoveth heat, and dryth, to be actuall and strong, which may there be sufficient for so notable an effect: but not potentiall, naked, remote, possible, or dreamed qualities. What is that heat, from what and whence is it rowled in the more deeper cold? what is that heat, so short, so strong, and so interrupted, which after a few rigours or extremities of tremblings, ceaseth; nor which doth shake the Earth a new by trembling? For if the cause of so great motion be in heat, there shall not at leastwise after the motion, be in heat, the cause of so sudden rest. Lastly, what is the dryness connexed to the fire, which may forthwith kindle under the Earth and Waters (the Waters being all alike dried up throughout all the Low-Countries) a fire, the Patron of so great exhalations?

But go to, let us feign by sporting, and grant a heat to be actuall under the Earth and Water, which is made by kindling: likewise, that great and stubborn heat, and its unwonted action, which may raise up the exhalations before the dryness of the thing? It is verily an irregular effect, not as yet hitherto seen among the Artists of the fire. Again let us feigne also other absurdities, that actuall fire, violent in the Water, or under watery Bodies, may there be bred without fewel, and be sustained, proceed, and long persist without fodder: but at leastwise, that fire shall not be able to raise up vapours, and much lesse inclosed exhalations, and to detain them in a narrow place, which may not choak that fire, out of hand; and make the sufficiency, forces, and successive generation of those exhalations void. For truly in the Burrowes of Mineralls, if the lights are not forthwith from above refreshed with a new blast of Air, they are presently extinguished, and the diggers also are deprived of breath and life. But if that the fire, and that the exhalation do subsist untill a sufficient breathing be given: Now, for that very cause, the motive exhalation its off-spring, shall first expire from thence; or if there be not room for a sufficient breathing, the fire verily shall of necessity be stifled, nor shall there be place for so great a successive exhalation, or for the repeated onset of an Earth-quake. Let us feign again, not indeed that actuall fire or heat is entertained under the Waters, in the afore-said Soils of the Earth: but that all the Low-Countries have had something in all places, like to Gun-powder, which at length, by its own ripeness, or a hidden conspiracy of the Stars, is enflamed at once and every where, and for that cause, doth afford a sudden exhalation, in every place equall.

But neither truly, under so many trifles, should all the Low-Countries then jogge any more than once, and it had gaped in the more slender, and lesse deep, and weighy places, and some pieces thereof had leaped forth on high, and a Chimny of that exhaling flame, would there follow. But the Low-Countries, and part of *Germany*, had not therefore trembled: For once, and at once, the Earth had some where

where rose up on the top, where it had gaped; but it had not often trembled, as it were with an aguish rigour. For truly the supposed action of inflaming, should be made onely, that the piercing of Bodies might be hindered;

13 Therefore as to the third point; To wit, that also a sufficient exhalation being granted to be under the Earth, nevertheless an Earth-quake is impossible; I have begun indeed, already to prove, by some granted fictions: Otherwise, after what manner soever an exhalation may be taken, and wheresoever that of the Pavements may be supposed, the Earth should not thereby tremble: but, where the least resistances should be, it should rise up into a heap or bunch, untill it had gaped, and the exhalation had made a passage for it self, by expiring thorow a huge Gulf. Which things, seeing they are not found to have happened, the tradition of the Schooles doth in this respect also, go to ruine.

14 For first of all, that it may more clearly appear, that the action and manner of the action is divers, when as for fear of a piercing of Bodies, a thing leaps forth, and that nature doth operate after another manner, by reason of the supposed lightness of exhalations striving to break forth: observe a Handicraft-operation: Let there be a Glasse-bottle, spacious, thick and strong; infuse in it four ounces of *Aqua fortis*, being prepared of Salt-peter, Alume, and Vitriol, being dried apart. But cast into that water, one ounce of the Powder of *Sal Armoniac*, and straightway let the neck of the Glasse be shut by melting it, which is called *Hermes Seal*. As soon as the voluntary action shall begin, and the Vessel is filled with a plentiful exhalation (yet an invisible one) and however it may be feigned to be stronger than Iron, yet it straightway dangerously leapeth asunder into broken pieces, for fear of piercing, but not by reason of the lightness of many exhalations. For truly, although it bursteth, by reason of the multitude, and the pressing together of most light and invisible exhalations; yet the lightness of the same, in this thing, hath nothing of moment: Because if any of these things should happen for lightness sake, the Glasse Vessel it self, before its bursting, would be lifted up into the Air, and fly upwards: Because it is a thing of lesse labour, to lift up a weight of three or four pounds, than to break asunder a most strong Vessel. Therefore the exhalations which do break the Glasse, should much more powerfully lift up the Glasse, if the Schooles did not beg the vain help of lightness from exhalations, for an Earth-quake. If therefore exhalations are not able by their lightness, to lift up the Vessel wherein they are shut, much lesse so great a quantity of Earth, and vast an heap.

15 Lastly, seeing that every exhalation is of some body, and every body if it be to be seperated, is divided into Salt, Sulphur, and Mercury; and the Mercuriall part be the watery part of the body: therefore it must needs be, that every exhalation is of a Salt and Oylie matter: And that, that is first to be raised up before the watery part: Which thing hath not as yet so happened in our Glasses, by the an equall action of heat. If therefore an exhalation be Salt, it is easily soaked or imbibed into the Earth; which may be seen wholly in all waters and exhalations of what Salts soever, which in acting upon the Earth, are coagulated in it, and loose all activity. Therefore, if they should be stirred up in the earth, they had failed, before they were, or in the making, had ceased to be. But if the exhalation be oily, surely that being laid, deposited or laid up into the Earth, it retakes the former shape of Oyl, and so growes together: Which thing, seeing it easily comes to passe, it cannot be thought, how an exhalation may by its lightness, make so great a heap of Earth, and of huge weight to stumble, sooner then to consult of coagulating. And upon every event, there should not be room, but for one elevation of the Earth, and one onely settling of the same, after some gaping chap is found; but not of stirring up a quaking trembling. But let these Dreams be in watery places, Meadows, Clayie places, pooles, the Sea, Rivers, &c.

16 Therefore the absurdities, which I granted before in jest, I will now oppose in earnest. First of all, I demand, what is that so unwonted heat, which from the year 1580, even unto the year 1640, was not seen at *Mecheline*? as neither an Earth-quake? wherefore not every year? wherefore in the 2d moneth called *April*, under a most cold night, when as the day before, it had snowed much? under the continuall North Winde? and not under the Dog-Star? Is it because the more inward parts of the Earth are then hot? Why therefore not every year in the eleventh moneth called *January*? But this Argument of the Antients ceaseth, after that the Instrument meating out the Degrees of the encompassing Air, is found.

For

For Wells and Caves are found, all the year, of an equall heat and cold. Again, why doth so great heat, the stirrer up of exhalations, cease so suddenly? especially where it may stir up an exhalation, the moover of so great an heap? by what fewell it is kindled under the water? by what Fodder doth it live and subsist? by what Law is it not in the same place stifled? by what priviledge doth it despise the respects of bodies, places, and weights? at length, by what Prerogative doth it stir up an exhalation of so great a vastness, out of moyst Bodies, without moyst vapours: or if it doth also allure or draw out vapours after the ordinary manner, why do not these mitigate a heat of so great moment? do they extinguish? do they choak together with their Silters, and forthwith following exhalations? or what is that exhalation, which shaketh the vast Tower of *Mecheline*, with no greater respect than a low Cottage? nor that respecteth any resistance of a huge weight? or which doth in a like manner operate near at hand, as at a distance? or which doth at once, every where, and alike, finde throughout its whole Superficies, the collected power of its own Center, that at once, every where alike, it may operate in one moment, equally and alike strongly? Why through the necessity of naturall causes, is not the thred broken in the weaker part: but all things do at once undergoe, yea and sustain the same law of violence? Surely if these things be rightly considered, there is found in the Earth-quake, a certain operative force, of an infinite power, which lifts up Mountains and Towers, without respect of lightness, or weight, as if nothing were able to resist this moving virtue.

But I have proved, that an exhalation, if in any there be an efficient moving cause of an Earth-quake, is neither of the race of Salts, nor of Sulphurs, as neither of *Mercuries* (because that this is not an exhalation, but the vapour of the watery parts.) Therefore it remains, that it is not an exhalation: but Gas it self, not an efflux of Bodies stirred up by heat; but rather an effect remaining after the fire: To wit, the Gas of the flame of the fire alone, or of the smoak sprung from this. But neither of these exhalations also, can be the effective cause of an Earth-quake. Therefore if none of these exhalations be the mover of the Earth, there shall be none at all (since another is not found) and by consequence, it is a vain fiction of the Schooles, which they will have themselves to be believed in, in the Earth-quake. But if indeed they thinking of an escape, do say, that they do not understand an exhalation raised up by heat, nor brought forth by dryness, but an unnamed vapour constituted by its causes: To wit, like as *Aristotle* writeth, that all Rockie Stones, small stones, Mineralls, and likewise the Salt of the Sea, Comets, although a hundred fold bigger than the Globe of the Earth, and all Windes, do proceed from some irregular and un-explained exhalations, distinguishing the Windes therein, against the Air: This I say, is to be willing to doat with *Aristotle*, and to remain ignorant of naturall Philosophy, with the same *Aristotle*. Lastly, it is an impertinent thing, for them to have cited *Aristotle*, and by his authority to be willing to defend their errors. Notwithstanding, I will treat against the Schooles by reason, that seeing they do publish themselves to be so rationally, they may deliver up their weapons to reason.

I say therefore, that no exhalation can be more light, simple, or subtile, than the Air: because, this is the simple body of an Element; but, that is a composed body; and so however it be, it hath in it a weighty body, which the Air wanteth: Yet the Air is not lighter than a Body that is without weight: that is, the Air is not lighter than it self, nor can it lift up any thing besides it self, unless by the motion of a *Flatus* or blast, or of flowing, that is, by a Blas: Which ceasing, the body which it lifted up, ferleth. From whence I conclude, that the Air or Winde, whether it be shut up or free, cannot lift up the Earth, by reason of its lightness alone, unless it be by chance stricken by an external and violent Mover: but in this case, the force of the exhalation ceaseth, seeing it is a constraining force which moveth, but not the exhalation it self: Because it is that which in such a case, is onely the mean or Instrument of motion, but not the chief motive force. And much lesse is that agreeable to an exhalation; because it is that which is thicker and weightier than the Air, as it containeth water.

I prove it by Handicraft-operation. A Bladder stretched out with Air, springs up out of the water; not primarily; because the Air is lighter than water: but because the water is a heavy and fluide body; and therefore it suffers not it self to be driven out of its place by a lighter body. For indeed it is the first endeavour of the water, to joyn it self to the warer, from whence it was seperated: its secondary endeavour, or that as it were by accident, is to presse out by its falling together, whatsoever is lighter than it self. Therefore weightiness, not lightness, doth operate in this thing, for the reason straightway to be shewed. Let a Bladder able to contain three pounds or pints of water, be put in a small trench or ditch, and let it be covered with Earth: Truly it shall not shake off from it, half an ounce of the dust poured upon it: Yea, neither shall the Bladder desire to appear out of the dry more weighty Sand. Let it therefore be ridiculous, that a Bladder weighing half an ounce, doth ever from

any lightness of Air, of its own accord fly up into the Air. If therefore much Air cannot lift up a Bladder; surely, much lesse shall the Air rise up, being pressed down under the huge weight of the low Countries. For indeed the Elements, do in the first place, and onely respect themselves; truly they act all things, for their own sake: And therefore, a Glasse-bottle being filled with Air and buried, can never a whit endeavour to spring up out of the Earth; because the Air is every where in its own naturall place, as oft as the space of its place is not filled with another body, neither is it carefull for passage. Therefore if there are hollow places under the Earth, the Air doth naturally rest in those places, from all locall motion: But in places where Sands fall down as it were a fluide body, there, because the dust fills up the empty place, and falls down through its weight, it also by accident presseth out the air. But that motion of the Earth or Water is not therefore efficiently from the lightness of the Air; or, that the Air, by the proper motion of its own lightness, doth move itself, and climbe upwards. But (mark) in this thing, weightiness it self, is the active, primary, and totall efficient cause: seeing weightiness, hath a reall weight, and is an active quality: but on the contrary, the lightness of the Air is the effecter of nothing; seeing it hath no weight, it of necessity betokeneth nothing, neither can it have any efficacy of acting. From whence it followes,

1. That the lightness of the Air, worketh nothing: nor, that a Bladder, which should be great, and weigh onely six grains, could be of its own accord, lifted up by the inclosed Air, how great soever, otherwise (which is false) the Air should be lighter than that which hath no weight.

2. That the Air doth not appear out of the water, by reason of its lightness, as it were the active, or the moving quality of swimming; but weightiness is the reall quality which expells the Air.

3. And therefore the position of the Schooles is absurd, wherein Air, or an exhalation is appointed for the efficient cause of an Earth-quake, by reason of its lightness, as if it should shake the Earth by lifting it up. Wherefore, seeing it is now sufficiently proved. 1. That there is not a place in the Pavements or Soils of the Earth, wherein any Aiery Body may be entertained, whether that Body be a Winde, or an Aiery exhalation: but by how much the deeper that place shall be sought for, by so much the greater difficulties do arise, as well by reason of the greater abundance of water, as the greater fardle of Earth, from above; so that, that is as it were of an infinite power, which should cause a trembling of the Earth. 2. And then, that there can be no fire, heat, driness, or any other stirrer up of an exhalation of so great power: or that which is co-related to it: That there is no possibility of such an exhalation in nature, there to subsist. And at length, thirdly, that no exhalation, by reason of lightness, doth operate any thing, or lift up a heavy body, much lesse, so vast a Country of Earth. Therefore I conclude, that it is an empty fiction of the Schooles, whatsoever hath been hitherto diligently taught concerning an Earth-quake.

Wherefore I will perfectly teach, that the manner of an Earth-quake diligently taught by the Schooles, is altogether impossible. Let us therefore again feigne absurdities, that, as it were, by the rule of fallshood, the error of the Schooles may be discovered. To wit, let us grant a Bladder to be of a matter that is tractable or easily to be beaten thin, being a thousand times stronger than all Iron, and to be spread (it is unknown in what Soil) throughout all the low Countries and *Germany*, under the foundation of Mountains, Cities, Seas, and Rivers: But a thousand huge paires of Bellows, most firmly, and excellently annexed thereto. Therefore that they may be able to lift up all the low Countries at once, it must needs be, that those Bellows, and the Posts and Axles of these, be so strong, as that they might be sufficient to lift up the weight. And then, a hand should be required, or an Agent of so great strength, that it might be able to lift up all the low Countries with its Palme, or else it could not presse together those Bellows which are full of winde: But such an Agent is not in the Sublunary nature of things, although the other granted absurdities should be present: therefore the vain lightness of the Air or an exhalation, is frivolous, and the inbred desire of their breaking forth. Therefore, I never a whit doubt to deny the naturall cause rendered by the Schooles, invented by the Devill, that my God his own honour may be over-clouded.

Because the Schooles have been hitherto ignorant, that lightness is not an active quality, and so much lesse should it be an overturner of Mountains: but they have sometimes considered, that a Mine which was before over-covered, hath straightway after an Earthquake, belched forth a stinking poyson, and made a gap for it self: therefore, they have dared through inconsiderateness and ignorance, to refer this effect of an Earth-quake by accident, into a cause by it self. Which things, that they may more clearly appear, let us again feign the aforesaid Bladder under the low Countries, to be stretched out with an Aiery Body, of its

own accord; or by the influence of the Stars (for when reason faileth, those that are ignorant do

do alwayes run back to the Stars, and causes afar of, (and for Witneses not to be cited) and no Bellows to be, as neither holes round about. Then at leastwise, the Body of all the Low-Countries, laying on it, should so presse the aforesaid Bladder with its weight, that, if it burst nor, it should at least, in its weaker, and lesse ponderous part, belch forth that which is contained in it. Which thing being obtained, now indeed the cause of the pressing together of the Bladder, and of the fall of the Low Countries, together with the opening of some gap, is present. But the cause of the lifting up of that Bladder, is not yet to be found, and much lesse, of the repeated succession of trembling and quaking. Lastly, neither is such a Bladder, and its substance possible to be, without which, although there should be room in the Earth, yet it is not fit for nourishing, or receiving that exhalation. Yea the bounds of the aforesaid Bladder being set or supposed, at leastwise, the Air, or exhalation works nothing, that it may lift up the Earth by its lightness; but if the Earth fall down or go to ruine, it findes not a cause for it selfe, as to this thing, in the lightness of the detained Air; seeing it shuts up the whole cause in the Fist of its weightiness; and the pressing out of the Air is to be measured, according to the measure of the weight that layeth on it. Therefore the Bladder being again supposed, if any Winde or Air should blow from without into the aforesaid Bladder, being pressed together, laying on the ground, and void of every Body: however most strongly it should blow, yet it could not at all blow up the Bladder, because, the low Countries laying on it, should presse it together. But if indeed, a fiery exhalation be sought for, in the place of the Winde, or Air, I have already demonstrated before, that fire to be impossible, and the exhalation of so great an effect throughout all the low Countries, to be fabulous. At length, that continuall Bladder, so strong, and capable to be hammered thin, also faileth, which may sustain, with its back, the low Countries, Seas, Rivers, and far more: For although, I have granted the same, it is not because I think it to be; but because, that Bladder being supposed, so great absurdities may also follow, and the Schooles at length be squeezed to an impossibility.

Mountains, Sulphurous places, and the mansions of Mines, have afforded to Countrey people (whence the Schooles have them) the beginnings of this Dream. Alas! is there everywhere a miserable drowsiness, in searching into the causes of effects? The Mountain *Soma* or *Vesuvius*, nigh *Naples*, hath burned now for some Ages, with Sulphur or Brimstone, and fire-Stones. But it hath a gap in its top, large enough, whereby the smoaks and flame might expire or breath out: To wit, perhaps to the largeness of three field measures or Acres of Land: But a Vault that was next to the flame, as being now sufficiently roasted, and full of chaps, at length, about the sixteenth day of the tenth Moneth or *December*, of the year 1631, by one sudden fall, fell down into the Gulf of the flame. But it is the property as well of some Metalls, as of bright shining Fire-Stones, while they are melting, that if any thing of water shall fall in among them, they all leap asunder: therefore the Sulphurs with the Fire-Stones being melted in the bowels of *Vesuvius*, they did not endure the roasted fragment falling down from the Rocks, without a great deluge, but the flame did vomit out all of whatsoever had slidden down from above, and more. Neither was this sufficient: But moreover, some Fountains were loosed from above, into the Chimney of the fire: But what have the melted Sulphurs, or what the raging tempests of smoakes, common with an Earth-quake? Do Sulphurs thus burn throughout all the low Countries? For an Earth-quake had gone before at *Naples*, and did accompany that danger of *Sodom*.

And although they shall happen together, they do not therefore partake of one onely roor, the which do obey divers causes: that Earth-quake fore-shewing a wonder, did also inclose in it a monstrous token, and doth alwayes inclose some such: But the belching out of Metallick Veins, stands by its natural causes. Surely a wretched Sophistry it is, to argue from not the cause, as for the cause: For neither are exhalations to be believed to have been enclosed in that Earth-quake, a Chimney is produced, having long since, a way opened for exhalations.

I would, the Schooles hath hearkened to their *Pliny*, that oft-times, at the present time or urgency of an Earth-quake, Birds, the winde being still, being as it were sore smitten with fear, do fall down out of the Air: that in a quiet Haven, the Oare Gallies do leap a little. But what fellowship interposeth between the Air and the Sea, with an exhalation shut up under the Earth? For doth the Air tremble, when the Earth doth? Is so small a trembling of the Air sufficient to cast down Birds, which fly in every winde? For because the Sand of the Sea (and that indeed without gaping) should leap a little, for the depth of half a foot; ought therefore the Superficies of the deep Sea, void of Winde, together with Ships, to tremble? A Manuscript of the Curate of *S. Mary* beyond *Dilea* of *Mecheline* was shewen, wherein

wherein he had written, that in the year 1540, once every day for three dayes space, the Earth trembled, before that lightning inflamed its Sand-Port, and also the Gun-powder contained therein: whence the City, by an un-thought of slaughter, being almost utterly dashed in pieces, went to ruine. Lastly, in the year 1580, the second houre after noon, the fury of the Windes ceasing, the City trembled, two dayes before the *English* invaded *Mecheline*, and took it for a prey. But what have those events (happening from a fatall necessity) common, in the joyning of causes, with a dreamed exhalation under the Earth? For what could a supposed exhalation portend, besides or out of it self? For why should it include a future signifying of a VVar-like invasion? or Lightning to come, and to kindle the Vessels of Gun-powder there also kept, shaking the Sandy Tower, and throwing down the whole City? For before that the Mountain *Vesuvius*, belched out its bowels, and covered very many small Towns, with a Minerall Clod, and denyed hope to the Husband-man for the time to come, thick darkness under the Sun went before, in the Air, lamentable howlings, and the Earth trembled, things stirring up the required devotion of the Nation. Truly the Earth trembled, from its own cause, for a fore-knowledge of the future slaughter threatned: But the slaughter it selfe followed by its naturall causes: But the fore-going signes, have never any thing common, with the event of future fire.

- 29 Since therefore now it is certain, that there is no place among the Pavements of the Earth, nor exhalation that layes under them; and if any should be under, yet that it were impossible to cause an Earth-quake; yet that it is an undoubted truth, that the Earth doth truly and actually tremble, without the dis-continuance of its pavements, or through the opening of some gap, I have considered that trembling to be in the Earth, no otherwise than in Brassie, when as the Clapper hath smote the Bell. For as long as the Bell trembles without a cleft, so long it gives a Tune. The Earth also, while it is shaken with its Super-natural Clapper, sends forth a deaf sound, because its body toucheth together indeed by Sand and VVater, even into its Center; yet it is not holding together by a continuance of unity without intermission. And it may tremble without the dis-continuance of touching together; indeed by so much the more freely, if the Metall be bended without the renting asunder of that which holds together: the Earth also in trembling, hath its inward Clapper more famous than the voice of Thunder. But because the stroak waxeth deaf in the Sand and VVater, therefore it is shaken together with a certain tune or note, while it trembled: yet the roaring which is sometimes heard, is not of the Earth, but a strange one; not proper to the Earth-quake, but an accidental howling of Spirits, which by the *Italians* is called *Baleno*. At length, I weighing the cause of an Earth-quake, do know, that in the first place, there is a motive force in the Air, whereby the Air doth commit to execution, the spurre conceived in the Stars: For the Stars shall be to you, for signes, times or seasons, dayes and years. Moreover, I know, that in the Sea, and deep Lakes, there is their motive force, whereby they suffer a raging heat without windes, whereby, I say, our Ocean is rowled six houres, and else-where, six constant months, with one onely flowing. Lastly I know, that the Earth is at rest, nor that it hath a motive
- 30 force actively proper to it self. Therefore, I believe, that the Earth doth quake and fear, as oft as the Angel of the Lord doth smite it. Behold a great Earth-quake was made: for the Angel of the Lord descended from Heaven, *Mat. 28*. The word (*For*) among the *Hebrewes*, doth contain a cause, as if he should say (*Because*.) For this is the onely cause of an Earth-quake, whereby all things, do without resistance equally tremble together, as it were a light Reed. In the *Revelations*, the third part of Mortalls, Trees, and Fishes perished at the very time, wherein the Angel powred forth his Viall: For abstracted spirits do work by the divine Power, and nothing can resist them. Evill spirits also, as oft, as it is granted them to act by a free power, they act without the resistance of bodies, or a re-acting of resistance. For matter is the Client of, or dependant on another Monarchy, and it cannot re-act into a spirit, which it by no meanes toucheth, and with no object, affecteth. Even as the Angel useth the powred out liquor of the Viall, unto the aforesaid slaughter; so, for the Earth-quake, he for the most part, makes use of a note or voice. For a wandering note was heard in the Air, no otherwise, than as the creaking of Wheelles driven: thereupon, as it were a tempestuous murmuring sound succeeded (yet without Winde) and at that very time, the whole tract of so great Provinces trembled at once, with a huge horreur: Which same note, accompanied the trembling of the Earth at every of the three repeated turns. The same thing almost, happens in Lightning: Truly the Lightning burns, and causeth melting: but surely, it smiteth not: According to that saying: *The voice of Thunder shall strike the Earth, because it smiteth*. For *Silk-worms* die, Milk is curdled, Ale or Beer waxeth sowre, a slain Oxe hanging up, retains flaggie flesh unfit to take Salt, and that onely by the Thunder-stroak, the Lightning doing no hurt there. Therefore let the voice of Thunder, and the voice of the Earth-quake, be the note

note or tone of ministring spirits. But the Stars do not stir up a motive, and alterative force of the Air or Water, through a note: but do act onely by an Aspect, which they call an Influence: And it hath its action and direction in a moment, even as light, sight, &c. For otherwise, there should be need of many years, before the audible Species or resemblances that are to be heard, should come down from *Saturn* to the places of a Meteor. And then, a note or sound, although it be great; yet it faileth by degrees in the way. But that the Earth doth tremble, with a Tempest of Windes, or that the Tempest doth sometimes run successively thorow Villages, Cities, and as it were thorow street by street in its wheeling about: That is wholly by accident, and according to the will of him, who shaketh the Earth for a monstrous sign. Likewise, that else-where, it doth oft-times tremble; in quick *Belgium*, very seldom: that changeth not the moving cause: For it stands in the free will of him, who encloseth the Universe in his Fist, who can shake the Earth at his pleasure, and alone do marvellous things: At the beholding of whom, the Earth shall at sometime smooke, and the Mountains being melted, shall go to ruine. But that in another place, gapings, chaps, after an Earth-quake, have sometimes appeared, and a filthy poyson, and fumes of arsenicall bodies have breathed forth, that is joynd onely to its naturall causes; Nor are they the effects of an Earth-quake, but by accident, but not the causes. But this blindness of causes of the Earth-quake, hath been invented, the Devill being the Authour, whereby mortall men might set apart all fear of the power, and so, might prevent, if not wholly neglect the ends which God hath appointed to himself, for the serious reverencing of the power of his Majesty, that they being mind-full of the faults of their fore-led life, might repent.

*Deh! qual possente man conforzze ignote
Il terreno a crollar si spesso riede
Non e chinsò vapor como altro crede
Ne sognato stridente il suol percuote.*

*Certo la terra si rissente, & scuote,
Perche del peccator sa aggrava il piede:
Et i nostri corpi impatiente chiede,
Per riempier se sue spelonche nuote.*

*E linguaggio del ciel che l'huom riprende
Il turbo, il tuono, il fulmine, il baleno,
Hor parla anco la terra in note horrende,
Perche l'huom ch'esser vuol tutto terreno,
Ne del cielo il parlar straniero intende:
Il parlar della terra, intenda al meno.*

*Behold! with what a mighty, yet unknown
A force, the Earthy Body makes a noyse,
And with so thick a rushing gives a groan:
'Tis not a vapour hot shut up (they'r toys)
Even as some believe, which beats the ground
[Or thumps its entrails] with a whistling sound.*

*Truly, the Earth it selfe doth feeble and quake,
Because the sinners foot doth load its back
And our impatient [mortall] bodies fall
In, to fill up its own deep Vaults withall*

*The Language of the Heaven which reproves
Man, is the Whirle-winde, Thunder, Lightning flash,
And sp'ritous howling in the Air [Ecchoes.]
Now speaks the earth more-o're, with horride lash*

*Of signall tokens, 'cause since man which would
Be wholly earthly, doth not understand,
The Linguo strange of Heaven, yet may or should
At least the Earth it's Language apprehend.*

- 31 These things nothing hindring, there hath not been one wanting, who said, that from a most deep well of the Castle of *Lovaine*, he by a sure presage foretold, an Earth-quake was shortly to be, because the water of the same Well, three dayes before, sent forth the stinking savour of Brimstone, and that its contagion, yellowness, together with the turbulency of the water, did bewray it. But let that good man know, that that Well is one hundred and fifteen foot in depth, because they go up to the Castle (from the Street that is next unto it) by ninety three steps: And so, that Well in one part, is not deeper than its Neighbouring Wells, although in the other part where it is co-touching with the Hill of the Castle, it is deep, as I have said. But seeing that a vein of Sulphur is not hidden in the Hill, the water could not breath Sulphur, which was not there: But if it cast the smell of Sulphur, a sign might precede, God admonishing: but it had not Sulphur, which neither is in that place, nor was enflamed: therefore neither could it cause an Earthquake unto all *Belgium* or the Low Countries. Therefore there is no naturall reason, why the water in that Well, should be more troubled by Sulphur, than in its neighbour-wells, wherein no such thing was seen. Lastly, we must know, that an Earth-quake is not made by the long preparation of causes from three dayes before: Because then the Earth could not be lifted up in one manner, at once: Yea, if any exhalation of Sulphur, had now three dayes before, fore-timely made a passage for it self, at that very time, it had now found a passage for it self, and had sooner breathed forth that way thorow that Well, before it had lifted up so great an heap on every side: yea, a passage being found, it had made the water by its blast, and boyling up, to sound in the boyling, and much more prosperously in the streetes that were so much lower, and the exhalation had broken forth in the more neighbouring places, and had burst in sunder the Hill it self more easily, by rising into an heap; but the Earth had not trembled: Therefore I reject the example of the deed, as long as the reasons opposed by me against it, from its impossibility, are not overthrown. Therefore the Earth trembleth, not because it feeleth or feareth after the manner of a living Creature: but it denounceth unto us, something like it, and doth as it were speak unto us, accusing of the stroke of the Angel, or the hand of an angry God.
- 32 But the Earth is smitten, and trembleth by the Command of God, pointing out, that sin hath ascended up to Heaven, crying out for vengeance before his Throne: Indeed the smiting doth presuppose indignation, and indignation, a heaped up measure of sin: But the end of an Earth-quake, is, that the sinner may amend himself, and that the righteous man may as well beware that he doth not sin, as of the threatned punishment of sin. Therefore an Earth-
- 34 quake, doth alway threaten punishments. But all particular offences, have chastisements suitable to themselves: For Luxury, and uncleanness, have Plagues and Diseases, for purging sacrifices and punishments: But Adulteries pay their punishments, by Diseases, imprisonment, disgraces, poverties; also barrenness, of off-spring, untimely death, or the like; According to that saying: *He that soweth in the flesh, shall reap in corruption*. But pride of life is punished, by poverties, barrennesses, wars, destructions, sudden death, a miserable losse of friends, &c. At length, covetousness payes its punishments, by deceits, thefts, juggles, discommodities of some member, &c. But if two or three sins do abound at once among a people, then punishments are also co-mingled: to wit, in-clemencies, tyrannies, breakings of a Vow or Oath, juggles or deceits, extorsions, plagues, barrennesses, wars, &c. But if sins are conjoynd in Powers or Princes, as well of the Church, as in Secular ones & Judges, The Prophecies are full, that for the injustice of the same, Kingdoms are translated from Nation to Nation: Which things, if they happen, with the rise of Arch Heresies, scandalls, and subversions of Altars, and especially, where the Poor suffer together with them; it is a signe that these evils do proceed, from filthinesses, in-clemencies, ambition, covetousness, breakings of a Vow, and drunkennesses or gluttonies. For the Prophecies do abound with threatnings, that *Jerusalem* shall be plowed as a field; the City shall be made as a heap of stones; that the Pestilence, and Enemy shall take away all the prey, and shall lead away the Chief of the Church bound; the holy place shall be defiled, that they may be for a derision among the Nations. But if Wars do not touch Religion, the sins onely of Princes and Judges are taken notice of. But the Earth trembleth, being smitten especially, for the sins of blood, which cry out for Heaven to be a revenger. Therefore after an Earth-quake, punishments are to be expected, which are deservedly due to excess, cruelty, and injustice. The trembling of the Earth
- 35

Earth therefore, denotes nought but the judgements of God a Revenger: To wit, a good thing from an evill cause; as it containeth an inflicting of punishment on the impenitent. Therefore from the Lords Resurrection, the Earth trembled, signifying the desolation of the City, and of the Jewish Monarchy, which the Gospel, together with the teares of the Lord foretold, and which *Iosephus* hath written down at large. For no calamities are without the Lords permission, nothing without its cause, *neither doth grief or misery spring out of the ground. Job 5. Isai 45. Neither do calamities at any time happen unto us by chance.* It was the most rare or un-couth wickedness of men, that slew the guiltless Son of God for his benefits: wherefore a most rare kinde of purging of the offence, ought also to rain upon that Nation, which had been educated with so great favour, to the killing of the men, and lasting destruction of the Common-wealth; As was fore-seen by *Daniel, Isaiab* and *Psal. 16.* But when an Earth-quake runs as it were thorow, street by street, a tumult of a City against a City is signified, and the streetes to be desolate or forsaken. For a friend saw this Chapter, it being as yet in Writing; he presently perceived that a naturall cause was wanting, and he consented: but he was angry, because I had deciphered the manner, and that the Earth should be smitten, not indeed with a Staffe, but by a note, or voice, and he laughed at the conjecture. *Why hath not God (he said) done those things by Gun-powder, by Winde, an exhalation, and a vapour? wherefore hath not he said it or spoken it, and the Earth was moved? with God there are a thousand wayes, neither is it certain what mean he hath used.* First of all, if I have given a reason, why the Earth trembling doth necessarily chap, by the example of a Bell which trembles after the stroak; certainly, he ought not to be angry with me; For, neither intended I, that he that exceeds every manner, doth tie up himself to manner and meanes: But in as-much as that friend doth inter-ject naturall meanes; as are the winde, a vapour, an exhalation, Gun-powder, laid under the Low-Countries: These things were already sufficiently refuted in my Writings, as to be possible in nature: wherefore, they are again unseasonably alleadged, as if God should have need of those meanes; Because when God makes use of meanes in working miraculously, he also often-times useth naturall things; but he doth not then make use of things which are reckoned as fellow-causes: For those meanes rather are, and do contain mysteries, than the vigour of any causality. Therefore, I have drawn my conjecture of the smiting voice or tone (not that I am a conscious or a fellow-knower of, or a searcher into divine Counsel) out of that word. *The Voice of Thunder shall strike the Earth.* *Moses* smote the waters of *Egypt*, and they were turned into blood, and the Frogs over-covered the Land of *Egypt*: he smote the Sea with his Rod, and the waters stood still: he smote the Rock, and it brought forth a Fountain. *Elisha* commanded the King, to smite the Earth, and was wroth with him, because he had not smitten it oftner, because the number of Commissionary sailings, did contain the number of Victories, and repeated turns of the enemy as yet to be beaten. Therefore for the keeping of peace with my friend, I have explained my self. I confess (I say) willingly, that I would not search into Divine Myseries: But the manner and meanes which God useth in the Earth-quake, I have attained onely by conjecture. But neither at length, have I desired to make these things known, nor that I might be taken notice of as a brawler; but that the fear of the Lord, which is the beginning of wisdom, may arise from the trembling of the Earth. *D. Streithagen* Cannon of *Hemseberg*, in his *Germane Flourish*, hath writ down a Chronograph, or Verse of the time of this Earthly trembling, by reason of its unwonted strangeness, and largeness of the places.

*Smitten (the 4th of April) was the Earth with tumult wide,
From which unwonted slaughter, covered Bodies down do slide.*

From the face of the Lord the Earth was moved, from the face of the God of *Jacob*.

CHAP. XVIII.

The fiction of Elementary Complexions and Mixtures.

1. *Why the Earth hath seemed not to be a primary Element.* 2. *That the fire is neither a substance, nor an accident.* 3. *That all visible things are materially of water onely.* 4. *Why the place of the Air which is called the middle Region, is cold.* 5. *What the three first things of the Chymists may be.* 6. *Some Bodies are not reduced into the three first things.* 7. *The unconstancie of Paracelsus.* 8. *The error of the Chymists.* 9. *The reducing of the three first things, into the water of a Clond, is demonstrated.* 10. *The swift or volatile Salt of simple Bodies, may be fixed by co-melting,* 11. *The three first things were not before, but are made in seperating, and that indeed, a new Creature.* 12. *The Oil of things is nothing but water, the seed of the compound Body being abstracted or withdrawn.* 13. *The same thing is proved in a live Coal.* 14. *What the wilde Gas of things is.* 15. *How a Gas is bred in the Grape.* 16. *The Gas of Wines.* 17. *Why much of the Grape may hurt.* 18. *That the Gas of new Wine, is not the Spirit of Wine.* 19. *An erroneous opinion of Paracelsus.* 20. *A twofold Sulphur in Tinne, from whence, the lightness of the same.* 21. *Gun-powder proves Gas.* 22. *Some things do mutually transchange themselves into Gas.* 23. *The mutuall unsufferableness of some things that are melted together.* 24. *That Gas, materially is not Earth or Air.* 25. *The same thing, by a supposition of a falshood, and seven absurdities.* 26. *That a mixt Body is not converted into an Element, by the force of an Element the Conquerour.* 27. *A Handicraft operation of the Liquor Alkahest.* 28. *Gas is wholly of the Element of Water.* 29. *It is proved by the Handicraft operation of a live Coal.* 30. *By Handicraft operation, that every Vegetable is totally and materially of water alone.* 31. *So a stone is wholly of water.* 32. *Fishes and all fatness, are wholly of water.* 33. *Every smoak is onely of water.* 34. *All Sulphurs are reduced into a smoak and Gas; but these are reduced into water.* 35. *Why fire cannot make Air of Water.* 36. *Ashes and Glasse are of Water alone.* 37. *The Gas of Salts is nothing but an un-savourie Water.* 38. *The Gas of fruits is nothing but water.* 39. *The Comments or devises of Schollars concerning exhalations.* 40. *Naturall Philosophie is in darknes without the Art of the fire.* 41. *The spirit or breath of life, is materially the Gas of the Water.* 42. *The sweat before death, is not sweat; but the melting of a Liquor.* 43. *By an Endemicall or common Gas, we are easily snatched away.*

I Have said, that there are two primary Elements; the Air, and the Water; because they do not return into each other: but, that the Earth is as it were born of water; because it may be reduced into water. But if water be changed into an Earthy Body, that happens by the force or virtue of the Seed, and so it hath then put of the simpleness of an Element. For a flint is of water, which is broken asunder into Sand. But surely, that Sand doth lesse resist in its reducing into water, than the Sand, which is the Virgin-Earth. Therefore the Sand of Marble, of a Gemme, or Flint, do disclose the presence of the Seed. But if the Virgin-earth, may at length, by much labour be brought into water, and if it was in the beginning created as an Element; yet it seemes then to have come down to something that is more simple than it selfe; and therefore I have called those two, Primary ones. I have denied the fire to be an

an Element and Substance; but to be death in the hand of the Artificer, given for great uses. I say, an artificial Death for Arts, which the Almighty hath created, but not a natural one.

But now I take upon me to demonstrate, that Bodies which are believed to be mixt are materially the fruits of water onely; neither that they have need of the Wedlock of another Element: to wit, that Bodies, whether they are dark, or clear, sound, or fluide, bodies of one and the same kinde, or those that are unlike; Suppose them to be Stones, Sulphurs, Mettalls, Hony, wax, Oils, a Bone, the Brain, a Grisse, Wood, Barke, Leaves: lastly, that all things, and all particular things, are wholly reduced into a water, altogether without savour, and so that they do consist, and are contained in simple water onely: For indeed, most of those things are destroyed by fire, and do straightway of their own accord, give their part to the water: which part, although it after some sort resembles the nature of the composed body, at length, at least-wise, the contagion of that composed Seed being taken away, that water, or Mercury of things, returns into the simple and un-savoury water of rain: So Oils, and fats, being separated by the fire, a little of the *Alkali* Salt being added to them, do at length assume the nature of Soap, and depart into Elementary water: yea, whatsoever things are inflamed by an open fire in the very entertainment of the Clouds, are reduced voluntarily, into water: For such was the necessity of the cold of that place (as I have already taught above) that whatsoever things should rise up thither from the lower places, should forget their seeds, by the mortall cold in that place, and their sub-division into a Gas of almost infinite Atomes. For Salt, Sulphur, and Mercurie, or Salt, Liquor, and Fat, are in the most speciall particular kindes or Species: not indeed, as certain universall Bodies which are common to all particular kindes; but they are similar or like parts in composed bodies, being distinguished by a three-fold variety, according to the requirance of the seeds. Therefore if the seminall properties shall the more toughly remain in the three things now separated: then, by things being admixed with them, the impressions of those properties are taken away, and estranged; From whence they do afterwards passe into the Element of water.

But some Bodies, do refuse to be divided into the three things; at length, the Liquor *Alkalest* of *Paracelsus* being adjoyned, they decay into a Salt, and that Salt is destroyed by passing over into an un-savory water. The Art of the fire being despised, hath made these things to be unknown in the Schooles. But I have not onely a War with those that are ignorant of nature, the despisers of the searching mistress of Philosophy, but also with *Paracelsus*, the Standard-defender of the Chymists: for whom, when it was hard to have declined from the beaten Road, he sometimes would have those three things to consist in the comingling of the Elements; and sometimes he thought the Elements of the World themselves, not to be bodies, but the empty places, or wombes of things: But in another place he denieth all of whatsoever is corporeall to be Elementary, but the Masse onely of the three first things. And again in another place, he hath taught, that the very Elements (yea the flame of the fire) do reduce themselves by a Method, into the four Elements: And so they cease to be naked Elements, in the place of three principles: But the flame it selfe (which is nothing but a kindled smoak) being enclosed in a Glasse, straightway, in the very instant, perisheth into nothing; So that a Glasse made in a glassen Fornace, with a bright burning fire, and being shut, could never contain any thing besides Air.

He being unconstant to himself, hath made himself ridiculous, and all those particular things, in fit places, are to be refuted by me. For the Chymists have hitherto believed, that the Elements do lay hid in the three first things. For they had seen Air and Fire, in burning Wax, to fly away together; and thereupon they have thought, that the water doth in part challenge to its self its air and fire: But they have thought, that the Earth flies away with the smoak. Which thing they have likewise supposed concerning those things which do leave a Coal and ashes behinde them; placing ashes in the room of earth: But they have believed that the fruits of the Earth and Mineralls, are indeed, as it were the allied pledges of the water; but they have believed them to be stirred up by the Wedlock of the other three Elements: but I come to the hand. Let there be *Aqua vite* excellently well purified from its dregs, which burns Oily bodies through its whole Homogeniety or sameliness of kinde: for that *Aqua vite* by Salt of *Tartar* which is near akin to it, is presently changed as to its 16th part, into Salt, and all the rest becomes a simple Elementary water: And one onely part is made a Salt, although it be of the same kinde with the other, and so is equally reducible into water, because that in actions of bodies and spirits, under their dissolving, there are made divers coagulations of the dissolver.

In like manner also in the operation of the fire, Salts which before were volatile or swift of flight, may partly be co-melted into a fixed Alkali, no otherwise than as Salt-peter and Arsenick,

Arsenick, being both volatile things, may be fixed by co-melting. Therefore the three first things are not onely seperated, but are sharpened, changed, do vary the nature of the composed body, and so are made by the fire, a new creature, not indeed being created anew, but being brought forth by the fire. So a Tile, is no more the earth of the Potter: but now a Stone. So ashes and smoak are no more Wood, nor an *Alkali*, nor Sand Glasse: Because the force of the fire doth not produce seeds, but by consuming doth transchange them, and by seperating, alters all particular bodies.

11 Moreover, none dares to say, that the Salt of *Tartar*, in the case proposed, doth produce an Element out of that which is not an Element, as if a Salt were the Father of the Element of water: but the Sulphur of the Wine, the seed being taken away, doth leave the matter of the *Aqua vite* to be such as it is: But the part, which may be fixed in the Salt of *Tartar*, which hath taken to it the condition of a Salt, was fat: it being before wholly capable of burning, volatile, and of the same condition with its fellows. Immediately therefore after the destruction of the seed of the Sulphur of the Wine, it is nothing but an Elementary water.

12 So every Oil is materially simple water, which a small quantity of seed translates into a combustible Masse, and playes the maske of a Sulphur: And every seed is (according to a Chymicall computation) scarce the 8200 part of its body: which part, if the fire shall change into families, it shall not be hard for it also to return into water. For the fire burning the fatness into Air, it wholly flies up to the Clouds, and there doth sometimes grow together through the cold of the place, into water: For Fishes, do by the force or virtue of an in-bred seed, transchange simple water into fat, bones, and their own fleshes: its no wonder therefore, that Fishes materially, are nothing but water transchanged, and that they return into water by art. I will also shew by Handicraft-demonstration, that all Vegetables and fleshes, do consist onely of water: but all things, if not immediately, at least-wise with an assistant, they do again assume the nature of water. Also every small Stone, Rockie or great Stone, and Clay, doth passe into a fixed *Alkali* of its own accord, or by things adjoynd (for an *Alkali* is that which before was not a Salt, yet its combustion being finished, it is a refining Salt.) So ashes is by its own proper *Alkali* made a meer Salt: But every *Alkali*, the fatness being added, is reduced into a watery Liquor, which at length, is made a meer and simple water (as is to be seen in Soaps, the Azure-stone, &c.) as oft as by fixed adjuncts, it layes aside the seed of fatness. For otherwise, it is not proper to the fire to make a water (rather a flame) but onely to seperate things of a different kinde. Therefore, if water may be made out of Sulphurs, and not by the proper transmutation of fire, it must needs be, that Sulphurs are begotten of meer water: For truly, neither is water seperated from Oils, but that is truly made of these; because the water was not in it by a formall act, but onely materially: to wit, the mask of the seeds being withdrawn.

13 Moreover, every coal which is made of the co-melting of Sulphur and Salt (working among themselves in time of burning) although it be roasted even to its last day in a bright burning Furnace, the Vessel being shut, it is fired indeed; but there is true fire in the Vessel, no otherwise than in the coal not being shut up; yet nothing of it is wasted, it not being able to be consumed, through the hindering of its efflux. Therefore the live coal, and generally whatsoever bodies do not immediately depart into water, nor yet are fixed, do necessarily belch forth a wild spirit or breath. Suppose thou, that of 62 pounds of Oaken coal, one pound of ashes is composed: Therefore the 61 remaining pounds, are the wild spirit, which also being fired, cannot depart, the Vessel being shut.

I call this Spirit, unknown hitherto, by the new name of Gas, which can neither be constrained by Vessels, nor reduced into a visible body, unless the seed being first extinguished. But Bodies do contain this Spirit, and do sometimes wholly depart into such a Spirit, not indeed, because it is actually in those very bodies (for truly it could not be detained, yea the whole composed body should flie away at once) but it is a Spirit grown together, coagulated after the manner of a body, and is stirred up by an attained ferment, as in Wine, the juyce of unripe Grapes, bread, hydromel or water and Honey, &c. Or by a strange addition, as I shall sometime shew concerning *Sal Armoniack*: or at length, by some alterative disposition, such as is roasting in respect of an Apple: For the Grape is kept and dried, being unhurt; but its skin being once burst, and wounded, it straightway conceiveth a ferment of boyling up, and from hence the beginning of a transmutation. Therefore the Wines of Grapes, Apples, berries, Honey, and likewise flowers and leaves being pounced, a ferment being snatched to them, they begin to boyl and be hot; whence ariseth a Gas; but from Ray-fins bruised, and used, for want of a ferment, a Gas is not presently granted.

The Gas of *Wines*, if it be constrained by much force within Hogs-heads, makes *Wines* 16
 furious, mute, and hurtfull: Wherefore also, the Grape being abundantly eaten, hath many
 times brought forth a disease Gas. For truly the spirit of the ferment is much disturbed, and
 seeing it is disobedient to our digestion, it associates it selfe to the vitall spirit by force; yea, 17
 if any thing be prepared to be expelled in manner of a Sweat, that thing, through the stubborn
 sharpness or sourness of the ferment, waxeth clotty, and brings forth notable troubles,
 torments, or wringings of the bowels, Fluxes, and the Bloody-flux. I being sometimes in my 18
 young beginnings deluded by the authority of ignorant writers, have believed the Gas of
 Grapes to be the spirit of *Wine* in new *Wine*. But vain tryalls have taught me, that
 the Gas of Grapes and new *Wine* are in the way to *Wine*, but not the spirit of
Wine. For the juyce of Grapes differs from *Wine*, no otherwise than the pulse of water and
 meal, do from Ale or Beer: For a fermentall disposition coming between both, disposeth
 the fore-going matter into the transmutation of it self, that thereby another Being may be
 made. For truly, I will at sometimes teach, that every formall transmutation doth presup-
 pose a corruptive ferment. Other more refined *Writers* have thought, that *Gas* is a winde or 19
 air inclosed in things, which had flowen unto that generation, for an Elementary co-mixture:
 And so *Paracelsus* supposed, that the air doth invisibly lurk under the three other Elements,
 in every body; but in time onely, that the Air is visible: but his own unconstancy reproverth
 himself, because, seeing that he sheweth in many places else-where, that bodies are mixed of
 the three first things; but that the Elements are not Bodies, but the meer wombs of things.

But he observed not a two-fold Sulphur in Tin (and therefore is it lighter than other Met- 20
 tallis) whereof one onely is co-agulable by reason of the strange or forreign property of its
 Salt, whereby *Jupiter* or Tin maketh every Metall frangible or capable of breaking, and
 brickle, it being but a little defiled with its odour onely: but that the other Sulphur is Oily.
 For Gun-powder doth the most neerly express the History of *Gas*: For it consisteth of Salt- 21
 peter (which they rashly think to be the Nitre of the Antients,) and the which is at this day
 plentifully brought to us, being dried up from the inundation of *Nilus* of Sulphur, and a
 Coal, because they being joynd, if they are enflamed, there is not a Vessel in nature, which
 being close shut up, doth not burst by reason of the *Gas*. For if the Coal be kindled, the
 Vessel being shut, nothing of it perisheth: but Sulphur, if (the Glasse being shut) it be sub-
 limed, wholly ascends from the bottom, without the changing of its Species or kinde. Salt-
 peter also being melted in a shut Vessel, as to one part of it, gives a sharp Liquor that is
 watery; but as to the other part, it is changed into a fixed *Alkali*.

Therefore fire sends forth an Air, or rather a Gas, out of all of them singly, which else, if 22
 the air were within, it would send forth from the three things being connexed. Therefore
 those things being applied together, do mutually convert themselves into Gas, through de-
 struction. But there is that un-sufferance of Sulphur and Salt-peter, not indeed by the wedlock
 of cold with hot, as of powerfull qualities (as is believed) but by reason of the un-cosuffera-
 ble flowing of boyling Oil and Wine, no lesse than of water; or of Copper and Tin, being
 melted with Wine. For in so great heat, when they co-touch each other throughout their
 least parts, they are either turned into a Gas, or do leap asunder.

For so Lead being roasted with *Mercury* and Sulphur, departeth into a sudden flame, a 23
 small lee or dreg being left, almost of no weight, yet enlarged to the extension of the
 Lead.

VVherefore if the Gas were air, all the Gun-powder should be air, and the Lead it self 24
 should be wholly air. But it is not possible for the fire to produce out of the same Element-
 ary fruit, sometimes air, sometimes water, with an ultimate reducement, unlesse the fire
 loose also its uniformity of working that was planted in it by the Creator. In the next place,
 it is already above sufficiently manifested, that air and water, can never be brought over into
 each other. Therefore if Gun-powder, or Salt-peter, may observably be reduced into an Ele-
 mentary water, by fire or any other mean whatsoever, a transmutation thereof into air is not
 possible to be. But some thousands of pounds of Gun-powder being at some time enflamed
 at once, have not yielded any thing but an inflamed Gas: which hath grown together in the
 Clouds, and at length, returning into water. Furthermore, a Coal is reduced in some Foun-
 tains, into a Rockie stone. Likewise I have known the meanes, whereby the whole of Salt-
 peter is turned into an Earth, and the whole of Sulphur being once dissolved, may be fixed
 into an Earthly Powder. What if therefore these three Earths should contain three or four
 Elements: at leastwise, the Earth should occupie the greatest part, nor that reducible into
 its former Gas: neither is it consonant to Reason, that a Body, which wholly flies away into
 an atery Gas, should be converted into Air, or into Earth, as man listeth. Next, seeing the
 three aforesaid Powders are at length made water, under the Artificer, which afterwards
 cannot

cannot any more through humane cunning, return into Earth or Air: it also followes, that the convertings of the Sulphur, Coal, and Salt-peter, into a Gas, or into Earth, are not the ultimate, as neither the true Elements of Air and Earth.

25 Lastly, let us measure these things in a rusticall sense: as if the aforesaid simple bodies should be sometimes turned into Air, but sometimes into Earth, because there was a mutuall transmutation of the Elements into each other: But at leastwise, the agreed on opinion of the Schooles doth resist these determinations, to wit, because a mixt body, in its corrupting, ought to restore the Elements whereof it is composed in generation.

2. Because a mixt body, consisting almost wholly of the Element of Air, the same cannot almost wholly consist of the Element of Earth.

3. Because the conversion of the Elements, is made by the action of one Element, and its superiority over the other.

4. But not that the forms of mixt bodies, or fruits, suffering by the inward Elements, have power to turn one Element into another.

5. Next, because the fire cannot dispose the mixt body, that it should be sometimes turned into Air, after inflaming, but another time wholly into the shape of Earth.

6. At length, because that in the corrupting of mixt bodies, there is not an immediate converting of one Element into another.

26 7. Last of all, because the variety of converting a mixt body into Elements, doth not depend on the will of man, who is able onely to joyn active things to passive: to wit, whose activity is in the victory it selfe of the superiour Element. Which kinde of Element, man neither bringeth, nor hath he it in his hand. That may here stand for a position, against them, which hath been sufficiently demonstrated in the Chapter concerning the birth of forms: To wit, that the fire is neither an Element, nor indeed a substance. Which things being supposed, it followes, that the three aforesaid simple things in Gun-powder, are not to be reduced from air into air, while they fly away into Gas, neither that they are to be reduced from Earth into Earth, while the Salt-peter doth by a certain Sulphur incline into Earth; but the Coal and Sulphur are changed through waters, into a Rockie Stone, and into Earth. And so the mixt suffering body, is not turned into an Elementary nature, by the action of a proper and conquering Element, as hath been thought. Wherefore, since it hath been already sufficiently demonstrated, that air and water, are by no possibility of Nature, Ages, or Art, to be transchanged into each other; It altogether followes, that while those three simple things do wholly yield themselves, sometimes into the likeness of Earth, but sometimes, into the form of Air, they are not true Earth, or true Air; but such an Earth, and such a Gas, which by their last reducement do return into water, dissembling a strange maske, according as they follow the guidance of forreign seeds. For I have known a water (which I list not to make manifest) by meanes whereof, all Vegetables are exchanged into a distillable juyce, without any remainder of their dregs in the bottom of the glasse: which juyce being distilled, the *Alcalies* being adjoyned, it is wholly reduced into an un-savory Elementary water: Neither indeed is that a wonder; For I will shew in its place, that all Vegetables do materially arise, wholly out of the Element of water alone.

28 If therefore every mixt body doth at length return into meer Rain-water; it must needs be, that every Gas proceeding out of mixt bodies, is materially of the Element of water. Therefore the Gas, which by the fire exaleth out of a live Coal, although it be enflamed, yet materially it is nothing but water: which very thing I have shewen above in the handicraft-operation concerning *Aqua vita*. 2 *Macchab.* 1. Nor else-where is there mention made in the holy Scriptures, of a thick water, which should be a perpetuall fire, perhaps not unlike to ours. For I have put equall parts of an Oaken Coal, and of a certain water, in a glasse Hermetically shut: in the space of three dayes, the whole Coal was turned by the luke-warmth of a Bath, into two transparent Liquors, divers in their ground and colour; which being distilled together by Sand, in the second degree of heat, the bottom of the glasse appeared so pure, as if it were newly brought out of a glasse Furnace: Straighway the two Liquors do first ascend, through the Bath, both being of equall weight with the masse of the Coal: But the dissolving Liquor, remaines in the bottom, being of equall weight and virtues with it self. Moreover, those two Liquors being mixt with a small quantity of Chalk, do at the third distilling, ascend almost in their former weight, and having all the quality of Rain-water. Therefore the Gas of a Coal, which doth not otherwise exhale, but in an open and fired Vessel, together with its ashes, are materially nothing but meer water: For the Seminal property of the composed body, which remains in the Gas, by the force of cold, and maturity of dayes, dieth, and the Gas returneth into its ancient water.

But

But I have learned by this handicraft-operation, that all Vegerables do immediately, and materially proceed out of the Element of water onely. For I took an Earthen Vessel, in which I put 200 pounds of Earth that had been dried in a Furnace, which I moystened with Rain-water, and I implanted therein the Trunk or Stem of a Willow Tree, weighing five pounds; and at length, five years being finished, the Tree sprung from thence, did weigh 169 pounds; and about three ounces: But I moystened the Earthen Vessel with Rain-water, or distilled water (alwayes when there was need) and it was large, and implanted into the Earth, and least the dust that flew about should be co-mingled with the Earth, I covered the lip or mouth of the Vessel, with an Iron-Plate covered with Tin, and easily passable with many holes. I computed not the weight of the leaves that fell off in the four Autumnes. At length, I again dried the Earth of the Vessel, and there were found the same 200 pounds, wanting about two ounces. Therefore 164 pounds of Wood, Barks, and Roots, arose out of water onely.

Therefore a Coal since it is wholly of water, if it be reduced in any Fountain, into a stone, it shall not be able to be by water changed into a stone, unless also that whole stone be materially meer water. For Fishes, as they do make of waters, much grease; so likewise, all fat, with the *Alkali* Salt, is made a Soap, which being afterwards distilled, doth return almost wholly into water, the which, when as by adjuncts it is spoiled of the seed of the Soap, it becometh an un-savory water. But every smoak is partly the volatile Salt of the composed body, being preserved from inflammation, by reason of the co-mingling of a water that flies away, and is partly an Oil, which through the swiftness of flying away, escapes combustion. For so the sharp Liquor of Sulphur drawn forth by a Campan or glassen Bell, doth shew that a great part of the Sulphur being untouched by the flame, ascended upwards, the which is again seperated safe from that Liquor by rectifying. For Sulphurs, or fats, although they are many times distilled; by any degree of the fire: yet they do alwayes remain fats, and even do retain their nature, as long as they do enjoy or obtain the seed of their composed Body: The which, when as the flame or artificiall death hath touched, they straightway flie over into Gas, but not into water: For that, every Gas doth as yet retain some condition of its composed body. For smoaks of the flame do differ by their generall, and speciall kindes: which surely should not be, if they should immediately depart into their first Element. The fire indeed destroyeth simply, but it generates nothing: for what seeing it wants the power of a seed; and those things which it cannot destroy, those it at leastwise seperateth, or leaveth untouched: and in this respect they are called fixt bodies.

But the fire doth not prevail in that, as to exchange that which is in it self materially water, into Air: for otherwise it should have the seed of the Air.

It is also sufficiently manifest before, that water is made air, or air water, by no help of art or nature. Therefore Wood, since it is wholly of water, its ashes, and likewise Glasse shall be of water. But that the Gas of Salts is nothing but water, the following Handicraft-operation proveth.

Take equall parts of *Sal-peter*, *Vitriol*, and *Alume*, all being dried and conjoynd together; distill a Water, which is nothing else than a meer volatile Salt: Of this, take four ounces, and joyn an ounce of *Sal armoniac*, in a strong Glassen Alembick confirmed by a Cement of *Wax*, *Rosin*, and Powder of Glasse, being powred most hotly on it; straightway, even in the cold, a Gas is stirred up, and the Vessel, how strong soever it be, bursteth with a noyse: But if indeed thou shalt leave a chap or chink in the juncture of the receiving Vessel, and after voluntary boylings up, thou shalt distill the residue, thou shalt finde a water somewhat sharp, the which by a repeated distillation, and an additament of Chalke, is turned into Rain-water. Therefore one part of the Salts yielded into water, but the other part into Gas. But the Salts that fled away by a Gas, are of the same kinde of nature with those that were reduced into water: therefore the Gas of Salts is materially nothing but water. But the Gas of fruits, I have likewise already shewen to be nothing but water, as arising immediately out of water. So the Raisin of the Sun being distilled, is wholly reduced by art into an Elementary water: which yet being new, and once wounded or bruised, much new Wine and Gas is allured or ferched out. If therefore, the whole Grape, before a ferment, be turned into a simple water; but the ferment being brought, a Gas is stirred up: this Gas also must needes be water: Seeing the disposition of the ferment cannot form air of that which is materially nothing but water. Therefore the unrestrainable Gas of the Vessel, breaks forth abroad into the air, untill it being sufficiently confirmed, and by the cold of the place spoiled also of the properties of its composed body, passeth over into its first matter, and in the air the seperater of the waters; it recovereth its ancient, and full disposition of the Element of water.

But

But exhalations, which in the account of the Schooles, are the daily matter of *Windes, Mists, Comets, Mineralls, Rockie Stones*, saltness of the Sea, *Earth-quakes*, and of all *Meteors*, seeing they have no pen-case or recepracle in nature, nor matter sufficient for so great daily things, and those for so great an heap, they are wondrous dreams, and unskillfully proportioned to their effects: And therefore I passe by these unfavourinesses or follies of the Schooles by pitying of them: At leastwise it followes, that if Rockie Stones, if all *Mineralls* do proceed from exhalations, and being now fixed, do resist the Agent which should bring them again into an exhalation, there shall be in the remaining *Earth*, matter for new exhalations, producing effects of so great moment: Especially because, scarce any thing exhalerh out of the saltness of the Sea; and such is the aptness or disposition of heat, that it scarce stirs up exhalations, unless it hath first lifted up all the water by vapours.

40 What matter therefore, shall be sufficient even for daily *Windes* alone? Truly, it is altogether impossible for the Schooles to have known the nature, and likewise the differences, causes, and properties of Bodies; for as many as have set upon *Philosophy* without the art of the *fire*, have been hitherto deluded with Paganish Institutions. At length, I have written touching long life, that the arteriall Spirit of our life is of the nature of a Gas: Which thing
41 is seen in the trembling of the heart, swooning and fainting: For how much doth it die to a lively colour, to a vitall light, and to a swollen or full habit of flesh, and the countenance itself being the more wrinkled or withered, how quickly doth it decay, straightway after the aforesaid passions? For the Spirit, which before did as it were unite all things by a pleasing redness, doth straightway fly away, and being subdued by a foreign *Air*, is changed. For truly, seeing the *Archem* is in it self, a Gas, of the nature of a *Balsamick Salt*, if it shall finde the *air* of another Salt to be against it, or in its way (even as *Sal armoniac*, when it meetes with the Spirit of *Saltpeter*) it is subject too easily, and forthwith to be blown away or dispersed through the pores, as having forgotten to perform its duties and office of the Family: For neither is it gathered into drops, because it is prepared of an arteriall bloudiness.

42 If any thing of sweat (at the time of faintings and death) doth exhale, that is the melting of the venall bloud, but not of the arteriall bloud. Therefore the vitall Gas, because it is a light, and a Balsam preserving from corruption, from the first delineation of generation, it began to be made suitable to the light of the Sun: But after the aforesaid failings of the Spirit, the in-bred Spirits of the other members as it were smoaking, are again kindled by the Sun-like light of the heart, even as the smoak of a Candle put out, touching at the flame of another Candle, doth carry this flame to the extinguished Candle by a Mean:

43 Seeing that the Spirit of our life, since it is a Gas, is most mightily and swiftly affected by any other Gas, to wit, by reason of their immediate co-touchings. For neither therefore doth any thing thereupon, operate more swiftly on us, than a Gas; as appeares in the Dog-vault, or that of the *Sicilians*, in the Plague, in burning Coals that are smothered, and in perfumes: for many and oftentimes, men are straightway killed in the *Burrowes* of *Mineralls*; yea in
44 Cellars, where strong *Ale* or *Beere* belcheth forth its Gas, an easie sudden death and choaking doth break forth. Wherefore I have greatly grieved, and pitied mans condition, that by so gross negligence of the Schooles, the more profound Remedies of fumes are almost suppressed, whereby not onely those who faint are refreshed; but also whereby the healings of most Diseases are performed: Which thing concerning odours or smells, at sometime explained in the matter of Medicine, every one shall with me, more easily disclose. Surely almost all Medicines are neglected which do restore the strength, and they have applied themselves onely to the diminishments of bodies, by the with-drawings of bloud, and solutive scamoneared potions, and by Cauteries, Baths, Clysters, Sweats, and Cantharides. For a Gas is more fully implanted, and odours do keep a more immediate co-touching with the vitall Spirits, than Liquors; if they are not partakers of a poysonous infection, at leastwise of the dulled properties of second qualities: and the which qualities, or especially that sublime one of the first digestion, they do lay aside, as it were Soils covered with Clay, if they are not as yet received with a great averseness of the *Archem*, or they being rebellious and stubborn, do with anguish resist the digestive powers. Notwithstanding, the *Scripture* might be opposed against me, which saith concerning man: *Thou art Earth, and into Earth thou shalt go*. How therefore, shall flesh, bone, &c. be materially of water alone? But I will say this from the force of the same Argument: If man be Earth, how therefore do the Schooles affirm, that man materially is not one onely Element, but foure Elements? therefore from that Text, those things which I have spoken above, are confirmed: To wit, that the Earth is not in the holy *Scriptures*, a primary Element; but every thing co-agulated of water, is called Earth.

Earth, because by its consistence, it is more likened to Earth than to Water; and so the veriest Earth it self, the prop of nature, is of water, no lesse than Man, Wood, Ashes, a Stone, &c.

CHAP. XIX.

The Image of the Ferment, begets the Masse or lump with childe of a Seed.

1. There is no seminall successive change without a Ferment. 2. Handicraft operation is brought into a Circle by Ale or Beere. 3. The Ferment makes volatile that which otherwise is changed into a Coal. 4. It is proved by handicraft-operation, in the venall Bloud. 5. The Bloud attains its own various ferments in the Kitchens of the members. 6. The unconstancie of Paracelsus is taken notice of. 7. The Beginnings of Paracelsus are made by the fire; but they are not in Bodies. 8. There are double ferments, from whence are the seeds of things. 9. The Birth of Insects. 10. 'Tis not sufficient to have said, that Insects are born of putrefaction or corruption. 11. A twofold manner of generation. 12. How seedes are made. 13. In what manner an odour or smell causeth a ferment and seed. 14. A Scorpion from Basil. 15. The ferment in voluntary seedes, reacheth to the Horizon or bound of life. 16. The ferment of Diseases and healings. 17. Almost all Medicines do act by way of an odour onely. 18. Therefore seedes are strong onely in a specificall odour. 19. An odour and light do pierce the spirits. 20. Odours do cause or incite, and cure the Plague and divers Diseases. 21. Art having forgotten its perfume, is translated into a servile rage or madness. 22. Unappeaseable pains, are presently appeased by the odour of an outward application. 23. The ferment is the Parent of transmutations. 24. Of what quality the ferment of the stomach is. 25. Why very many do abhorre Cheese. 26. A sharp fermentall thing differeth from soure things. 27. From whence belching is. 28. The labour of Wisdom. 29. All things which are believed to be mixt, are onely of Water and a ferment. 30. The ferment of the Equinoctiall Line. 31. The progress of seedes and ferments unto propagation. 32. The originall and progress of Vegetables. 33. Ferments do sometimes operate more powerfully than Fire. 34. Paracelsus is noted.

AS no knowledge in the Schooles is scantier than the knowledge of a Ferment, so no knowledge is more profitable: The name of a Ferment or Leaven being unknown hitherto, unless in making of bread: when as notwithstanding, there is made no successive change, or transmutation, by the dreamed appetite of matter, but onely by the endeavour of the ferment alone. In times past, leaven, and all things leavened, were forbidden, and the Mystery hidden in the Letter, was then of right interpreted according to the Letter: For as leavens or ferments were altogether the way-leaders, and necessary unto every transmutation of a thing: so they did denote corruption, unconstancy, and impurity; and therefore a flight from leaven was enjoined.

I will first of all explain a thing surely so paradoxall in naturall Philosophy, by an example: The purest of Ales or Beeres (which is deservedly the nourishing juyce or meat, melting, or finished right of the Grain) requireth so much Grain, by how much there is capacity and largeness in the Vessel or Hogs-head: And so indeed, that the Bran being taken away

away, all the Meal doth melt into the Ale or Beer, and the Water onely supplies the place of the *Bran*. That *Ale* or *Beer*, by a very little ferment or leaven being admixtred, doth boyl up by fermenting in Cellars, it waxeth clear by degrees, and the dreg falls down to the bottom: at length something doth fermentally wax foure, by which tartness it consumeth all its dreg: And then, it looseth more and more, daily, its sharp, or pricking sourness: At length it is deprived of the taste, virtues, and body of the meal. And last of all, it, of its own accord, returns into water. That *Ale* or *Beere*, being distilled,

3 layeth aside very much residence in the bottom, like a *Syrup*, which at length by proceeding, is changed into a Coal: But if that same *Ale* or *Beere*, by the degrees of the ferment shall passe over into water, it leaveth no more dregs in the bottom while it is distilling, than otherwise, the water from whence it was boyled, did contain, because the natall sediment of the waters is not subject to the ferment of the Grain, since it is not the object thereof; but the Client of or dependant on another Monarchy. Therefore the Grains do return unto their first matter whereof they are, which is water, and that by the virtue of the ferment onely.

4 In the next place, every one of us doth daily frame to himself, 7 or 10 ounces of blood; but (at leastwise in our standing age) as much blood must needs be consumed, as is a-new, generated: For else a man might straightway fear a hugeness or excessive greatness. And then, the blood is by degrees, changed into a vitall mucilage or slimy juyce, the true, immediate nourishment of the members of which it is wont to be said, *we are nourished by those things, whereof we consist*. But they will have this nourishment to be sprinkled on all the particular members; in manner of a dew (but I believe it to be framed in all the least Kitchens of the parts) whereby it may moysten the same, and for that cause, defend them from dryness, the calamity of old age, as much and as long as it can. At length, that dew doth unperceivably flee thorow the pores of the skin, neither doth it leave any thing of a solid sediment remaining behinde it: For so do nourishments at length expire thorow the skin in the shew of a Vapour, and like water. But the Schooles will have this secondary humour, after that it hath slidden like a dew into the parts, to be assimilated or made like them, and to be informed by the Soul: But I permit it to be assimilated, onely under the growing of youth, but no longer afterwards; seeing that neither is it any longer turned into the substance of the similar parts. For which way should that dew be assimilated to a Bone, in strength, hardness, and driness, &c. if the bones do now no longer receive an increase? Let the same judgement be of the other parts: for all particular things in nature have a birth, an increase, a state or standing, a declining, and a death.

5 This is therefore the Tragedy and Metamorphosis or transforming of the blood, by the virtue of the seed. But otherwise, the blood being distilled, doth at length lay down much of its salt Coal, neither hath it any manner of volatility, which the operation of the ferment doth consequently grant unto it under the other digestions. Because heat, seeing it wanteth a transmutative ferment of things, it onely seperates the parts, but doth not change them. Therefore the blood doth obtain its aforesaid ferments, in the very Cook-rooms of our body, and is thereby made so volatile, that moreover it leaveth no remainder of it selfe.

6 I admire at *Paracelsus*, that he teacheth, the blood to be the universall Mercurie of the body, as also of meats; yet that he will have sweat to be an excrementitious Sulphur. Seeing all blood doth exhale thorow the skin; but if together with the watery Liquor or juyce of sweat, but a very little of fat flowes out; it is not therefore presently of *Mercury*, made *Sulphur*, unless he be unmindfull of his own Doctrine; Although something of fatness, may infect our garments in manner of sweat; for greases are not unchangeable, but they perish daily even as they do increase. Surely I have hated the proportionable resemblance of the principles of *Paracelsus* brought back into the three principles of nature: because they are those things which are neither in bodies actually, nor are they present; nor are seperated, unless by changing them first as it were by the fire, or by the reducement of melting, they are prepared as it were new things. For truly, I do willingly behold a naked naturall Philosophy every where; surely, I do not apply figures or moving forces in Mathematicall demonstration unto nature: I shun proportionable resemblance, as also metaphoricall speeches as much as I can. I have dedicated every necessity of nature to the seeds; but the seeds of many things, I fetch not so much from the Parents, as from the Ferments.

8 There are therefore double Ferments in nature: one indeed containeth in it a flowable air, the feminall *Archeus* which aspireth by its flowing into a living Soul: But the other doth onely contain, the beginning of the moving, or the generation of a thing into a thing: The which indeed, although in its beginning, it should not have a feminall air, which may embrace

brace or contain the aims of things to be done; yet it straightway obtains a vapour, which, as well the locall ferments, as those things which the disposition of the matter it self attaineth by externall nourishing warmth; do awaken: Whence something like an *Archens* is made, which changeth, fitteth, and increaseth it self, and its own perceived entertainment: Moreover, afterwards it acteth the other things unto a proportion of perfection, and to what is required of that air: For this seed doth at first abound with a certain, and that a generically largeness: For although it rejoyceth to have directed the masse subjected under it, unto the scope of the conceived ferment; yet oft-times it receiveth the fewels of a more hidden light from elsewhere, and a rash boldness being taken, it aspireth also into a living soul.

For from hence, not onely lice, wall-lice, or flies breeding in Wood, Gnats, and Worms; become the guests and neighbours of our misery, and are as it were bred or born of our inner parts, and excrements: but also, if a foul shirt be pressed together within the mouth of a Vessel, wherein Wheat is, within a few dayes (to wit, 21) a ferment being drawn from the shirt, and changed by the odour of the grain, the Wheat it self being incruited in its own skin, transchangeth into Mice: and it is therefore the more to be wondered at, because such kinde of insects being distinguished by the Signatures of the Sexes, do generate with those which were born of the seed of Parents: That from hence also, the likeness or quality of both the seeds, and a like vitall strength of the ferments may plainly appear: And which is more wonderfull, out of the Bread-corn, and the shirt, do leap forth, not indeed little, or sucking, or very small, or abortive Mice: but those that are wholly or fully formed. Now and then, the lowlie evill ariseth in us, and a louse, mans upper skin being opened, goes forth: he is also otherwise generated in the pores, being not indeed enclosed in the Eggeshell of a nit; but small, and scarce to be beheld. But the gnat is alwayes not generated, but by the ferment being drawn more outward. Neither hath it been sufficient to have said in the Schooles, that such insects do proceed from putrified things:

For Birds Eggs also do notably putrifie, and stink hugely, before the constituting of a chick. Therefore life is in those putrified things, no lesse than in Eggs: nor is it sufficient to have doubted from whence those kindes of Insects may draw a uniform and specificall vitall spirit out of our Body, seeing a natural generation doth presuppose an imprinted Seal of likeness: For truly in an irregular generation, an *Archens* sufficeth, not indeed a humane one, but such a one, which by a fermental virtue, and for identity or sameliness sake, doth alwayes generate in excrements, such Insects of a like or an equall form: And so, although in respect of us, it be a monstrous and irregular generation, yet it is naturall and ordinary in order to its causes, to wit, we affording onely a ferment and nourishing warmth: therefore the ferment of the shirt being sprinkled on the Wheat, doth resolve the matter by going or entring backwards, and so a youthful moule, but not a new one is born: For that, it hath respect unto another manner of making.

Therefore in the former, and vitall seedes, the generater inspires the *Archens*, and the vitall air, together with the masse of the seed, with his own likeness: But in the latter, the Odour onely of the ferment is snuffed in from the containing Vessels, or from the contagion of the encompassing air: which when they shall be rightly fitted together, they are straightway formed into a Plant, or Insect, to wit, the Air being stirred up by the Odour, and ferment of putrefaction by continuance, which afterwards is exalted into a ruling *Archens*: Even as concerning forms elsewhere.

Therefore seeds are made by the conception of the generater, making his own Image through desires, or from the Odour of the ferment, which disposeth the matter to the Idea or first shape of a possible thing: For even as the matter drawes from the Odour a disposition of transmutation; so from the Image is afterwards made a disposition of the matter, which procurereth and promoteth a specificall ferment: But in this the ferment differs from the seed: that, that is an Odour, or quality of some putrefaction by continuance, apt to dispose unto an alterity or successive alteration, and corruption of the masse: But the seed is a substance wherein the *Archens* already is, which is a spiritual Gas containing in it a ferment; the Image of the thing, and moreover, a dispositive knowledge of things to be done.

Therefore whatsoever things do contract a filthiness, or putrefaction by continuance, from an Odour, do also presently conceive Worms: and therefore also Balsams know not how to putrifie, or breed Worms: For the Odour of the Herbe Basil being inclosed in the seed, produceth that Herbe, together with an Air that existeth within it; which Odour, if it be changed by a putrefaction through continuance, it produceth true Scorpions: For neither is it a fiction; but in very deed, the Herbe being bruised, and depressed between Bricks, and exposed to the Sun, Aquitane after some dayes, hath yielded unto us, Scorpions. But the more curious

ous one will say, That the *Scorpion* came from without, to the sweet smell and food of the *Herbe*: but that doubt is prevented. For truly, the two bricks being mutually beaten together, did suitably touch each other, so that they hindered the entrance of the *Scorpion*, as well by their co-touching plainness, as by their weight: But a trench did contain the Herb in the middle. The Ferment therefore in a voluntary seed, doth after a neer manner reach to the Horizon or terme of life: For neither is one thing changed into another without a *ferment* and a *seed*.

- 15 Which things, as they have stood neglected hitherto, all things have been ascribed to naked or bare hearts, and the healings of many Diseases have remained desperate: For truly they have hitherto laboured onely about the correcting of the first qualities, and the withdrawing of a feigned humour, either alone by it selfe, or together with the blood; but they have not a whit considered, that every Disease is poysonous, if not to the whole body, yet at least, as to a part of it: and so although it be not contagious to every part, yet it ceaseth not to imprint its *fermentall odour* from its self, on the part whereon it setteth.
- 16 Therefore healing for the most part, is perfected by *Odours*, as also, contagions being imprinted on the skin, do forthwith depart from *odours*: For because an *odour* doth contain the resembling mark of the *ferment*, and from hence the Seminary cause of transmutation; I conclude, the virtues of things, and their masculine strength to be from *odours* (even as in *magnum oportet*, in its place.) Yea, if the thing it self be more fully looked into, even inward
- 17 Medicines, as well solutive as corrective, do work onely by way of an *odour*: For hence it is, that the smell of a Medicine being once put off, the faculties or virtues of the same do perish. For I have often seen the *Quartane-Agüe*, over-flowings of the wombe, melancholy, pains of the *Colick*, &c. to be seperated by Ointments alone: But it is certain, that not the Ointment it selfe, but its *odour* onely creepes and acts inward: For so one that hath the falling-sickness, falleth by an *odour*, yea the brain in the falling-evill, which heareth not, which perceiveth or feeleth not, nor which, if it hath fallen into the fire, doth withdraw it self, obeyeth onely *Odours*. For so an *Erisipelas* or *Anthomies fire*, is healed by the *odour* of a towel dipt in *Hares* blood, if it be bound on drie: So wounds, Ulcers, and Impostumes or corrupt swellings, do through *odours* applied by anointings, wax milde, or are exasperated or enraged.
- 18 Therefore if the seeds of voluntary living Creatures are to be born of odours, and a putrefaction by continuance, nor do differ in the particular kinde, from others which are procreated by a conjoyning of the Sexes: the seedes of all living Creatures also, must needes have their specificall odours, whereby there are made suitings or fittings of the *Archeus* to the matter, and the more easie obedience for transchanging: From whence at length are made diversities of impressions into any bowels Organs, and powers, and in the strength, and life: Surely specificall odours do affect the matter, and subdue it into their own protection: and an inclination, and selfe-love ariseth from the specificall odour: Next, through custome, there is an easie receiving, and a more perfect fitting: and at length, a love snatcht into all desire of its selfe: Therefore fragrant or sweet smelling things do delight: Even like as the light pleaseth good natural inclinations, so it displeaseth reprobate ones; and that not, because both do see alike well, without, or with light, or have need of the use of a clear air, or not; but by reason of the abstracted, and Almighty light, whose Image the light of the day is: For the spirits are delighted with an odour and light, because light and odour do immediately touch and pierce them: For the spirit of the blood in one that fainteth, ought to be more refreshed by the smell of roasted flesh, than by a sweet smell, unless the fragrancie should as soon as it toucheth the life, prepare herein a purity, and sweetness. Odours therefore are seen to reach even unto the abstracted spirits, even as a pestilent smell being not perceived by the nostrils, shakes the *Archeus* with horror.
- 19 For there are odours which do move, and by their contagion imprint head-aches, loathings of the stomach, vomiting, Coughs, the hicker, giddiness of the head, falling evill, Apoplexie, bloody-flux, &c. And therefore there are others also, which in a co-like manner, do cure the same, or at least do mitigate them, though they have taken a more fast root: And there are some odours, which choak without a perceivable astriction of the matter, and some are also convulsive or pulling together, and there are some, which do likewise insatuate or befool, as it very often comes to passe in affections of the womb.
- 21 For the Antients worshipped their perfumes even unto superstition, whereby they would drive a man as it were into an extasie, and they supposed that they thereby profited the awakened: For they infected their Bed, Garments, Head, and things that they used, with their Odours, whereby they might provoke their minde to studies: whereunto when Satan had joyned his hidden deceits, the art of perfumes being first suspected, straightway after remained

remained wholly rude or untilld. They had learned in the Law, that sweet smelling Sacrifices were pleasing to the Gods above; and the *Israelite* was enjoyned in the Camps, daily to cover his excrements in the ground, least it should grieve the Angel to go over, or compass the night Camps: For I remember, that a certain man was well nigh consumed with a grievous pain of the stomach: For four houres after meat, he wailed, howled, and was drawn together, unless he laying on a Table, did strongly presse the place: For I being deceived with an aptness of belief then thought, with *Paracelsus*, a Canker of the stomach to be incurable: for it was the place where the bastard ribs do approach the mouth of the stomach. This man, I say, I saw cured in a few houres, by a fragrant emplaster extended scarce to the breadth of the palm of ones hand.

After what manner the ferment is the parent of transmutations, I have not better found out, than by the art of the fire: for I have known, that as often as a Body is divided into finer Atomes than the necessity of its substance doth bear, a transmutation of that Body doth also continually follow in an Element: As the ferment being drawn, and snatching to it the aforesaid Atomes, doth season or besmeare them with the strange character of it self, in the receiving whereof, there are made divisions of the parts, which diversities of kindes, and divisions of parts, a resolving of the matter doth follow: for this cause indeed; Chymistry doth digest, and send purefactions before hand, that a ferment being received, the parts may cleave asunder into the smallest things: And so meats in the stomach are resolved through the ferment of the place, being seasoned with a sharpish quality: but in the liver, and other places, continually by other ferments. For so, although people are fed with much Sugar, yet straightway, they sometimes vomit up that which is soure: yet neither is the ferment of the Stomach, as it is sharp, the ferment: For neither do therefore, Vinegar, or Raspes Leaven, although they are soure and harsh: but the sharpness of the Stomach, is the proper specificall mean thereof. But yet also, in one particular kinde or Species, it undergoes much latitude: for this man beares grievously, Potherbs, another pulse, some one, Fishes, or Wine; because he doth not digest them.

Very many do not eat Cheese: not indeed because it is a meer Tartar, or a meer Salt, (both, by course, so *Paracelsus* wilieth;) but the new, waxeth breachily sharp, which doth easily stir up torments or wringings in a soure stomach: But the old casts a smell of rottenness or corruption, which it hath from the dead curd, being before excrementious in it self. Therefore it breedeth worms, and easily putrifieth, because it hides part of a stinking or Dunghilly ferment under the soureness of the milk; in many, it is manifested, and ariseth into a degree: And therefore it displeaseth many, onely with its smell: therefore the latitude of a sharp ferment, although specificall, happeneth to be in the stomach, because there are divers alterations of the framer and receiver, in acting: but in this, a sharp fermentall thing, differs from soure things; That what things that pierceth, it doth also make volatile by the same endeavour: but every sharp Spirit, in dissolving is it self coagulated, according to that Chymicall maxime. The bread of one, is broken small by a Man, a Dog, Horse, Cow, Sheep, Bird, Fish, and so, by as many specificall and soure ferments being distant in kinde. Boyes say that Sparrowes wax wondrous sharp in the throat, and therefore they are also devouring: for it happens, that a Sparrow hath snatched at the tongue of a Boy put out, and hath endeavoured to swallow, by which meanes, they say that they have tasted the sharpness of his throat: For so many living creatures are constrained for the asswaging of sharpness sake, to eat Chalk, Lime, Bricks, or whire Earth. Therefore the more fine, and the volatile Atomes of meats are easily changed by the ferment of the Stomach, into a windy Gas, when as the other part is content to be resolved onely into a juyce: For Chymistry is carefull in searching for a body, which should play together with us by a harmony of such purity, that it cannot be dispersed by that which corrupteth. And at length, religion is amazed or astonished at the finding of a latex or liquor, which being reduced to the least Atomes possible to nature, as loving a single life, would despise the Wedlocks of every ferment: therefore, desperate or without hope is the transmutation of that, it not finding a body more worthy than it self which it might marry: But the labour of wisdom, hath caused an irregular thing in nature, which hath arisen without a ferment diverse from it self, that may be mixed with it: That the Serpent hath bitten himself, hath revived from the poyson, and knowes not hereafter to die.

And indeed, because the Schooles have been ignorant of ferments, they ought also to have been ignorant, that solid bodies are framed onely of water and a ferment: for I have taught, that Vegetables, and grain, and whatsoever bodies are nourished by those, do proceed onely from water: for the Fisherman never found any thing of food in the Stomach of a *Salmon*. If therefore the *Salmon* be made of water onely (even that of Rivers) he is also nourished by it. So the *Sturgeon* wants a mouth, and appears onely with a little hole beneath in his throat,

throat, whereby the whole Fish draweth nothing besides water: therefore every Fish is nourished, and likewise made of water; if not immediately, yet at least by seeds and ferments, if it be great with young. From the Salt Sea, almost every sweet Fish is drawn: Therefore it turneth Salt, into not Salt, or at leastwise, water into it self, not into water. Lastly, Shell-fishes do form to themselves stony shells of water, instead of bones; even as also all kinde of Snails: therefore the Salt of the Sea, which scarce yieldeth to bright burning fire, waxeth sweet by the ferment, in fishes, and their flesh is made volatile, and at the time of nourishing it is also wholly dispersed, without a residue, or dreg. So also Salt passeth over into its original Element of water: and so the Sea, although it receiveth salt stream, yet it is not every day the saltier.

30 For the purest water, although it be free from all defilement, nevertheless under the Equinoctial-line it waxeth filthy or hoary, stinketh; straightway it becomes of the colour of a Brick half burned, and then it waxeth green; and lastly, it waxeth red with a notable horror or quaking: Which afterwards, of its own accord returns entirely into it self again. Truly, these things happen by the conceived ferment of the place; and that being consumed, they cease.

31 So the most pure Fountain-water waxeth filthy through a ferment of the Vessel putrified by continuance, it conceiveth Worms, it brings forth Gnats, yea is covered with a skin. Fens putrifie from the bottom, through continuance: hence arise Frogs, Shell-fishes, Snails, Horse-leeches, Herbs, &c. And moreover, swimming-herbs do cover the water, being contented onely with the drinking of water putrified through continuance. And even as stones are from Fountains wherein there is a stony seed and ferment existing; So the Earth sinking with metalliferous ferments, doth make out of water, a metalliferous or Mineral Bur. But the water being elsewhere shut up in the Earth, if it be nigh the Air, and stirred by a little heat, it putrifieth by continuance, which is no more water, but the juyce *Leffas* or of Plants: by the force of which hoary ferment, a power is conferred on the Earth of budding forth Herbs: for that putrified juyce, by the prick of a little heat doth ascend into a smoak, is made spongie, and encompassed with a skin, by reason of the requirance of the ferments therein laying hid. Therefore that putrefaction by continuance, hath the office of a ferment, and the virtues of a seed, hastening by degrees into the *Archeus*, through its seminall virtues, into a quantity of life. Therefore the juyce of the Earth putrified through continuance, is *Leffas*: From whence ariseth every kinde of Plant wanting a visible seed, and from whence seeds that are sown, are promoted into their appointments: therefore there are as many rank or stinking smells of putrefactions by continuance, as there are proper savours of things; for that, odours are not onely the messengers of savours, but also their promiscuous parents. The smoak *Leffas* being now gathered together, doth at first wax pale, afterwards wax yellowish, straightway it waxeth a little whitishly green; And at length it is fully green. And the power of the Species or particular kinde being unfolded, it assumeth divers Colours and Signates: In which flowing, it imitates the leading of the water under the Equinoctial-line: yet in this it differs, that these waters have borrowed too Spiritual a ferment from the Star and place, without a corporeal hoary putrefaction; and therefore, through their too frail seed, they straightway return into themselves: but *Leffas* is constrained to perfect the Tragedy of the conceived seed. Therefore Rain conceiving a hoary ferment, and being made *Leffas*, is drawn into the lustfull roots by a certain sucking. And it is experienced, that within this Kitchen, there is a new hoary putrefaction of the *Ferment* the Tenant: by and by, it is brought from thence to the Bark or Liver, where it is enriched with a new ferment of that bowels, and is made an Herby or woody juyce, and at length, a ripeness being conceived, it becometh Wood, becometh an Herb, or departs into fruit: but the Trunk or Stem, if it sooner putrifies under the Earth than the Bark or Rhine becomes dry, it cleaves asunder by its own ferment, sends forth a smoak thorow the Bark, which in its beginning is spongie, and at length hardens into a true root; and so planted branches become Trees by the abridgement of

33 Therefore it is now evident, that there is no mixture of the Elements, that all bodies primitively and materially, are made onely of water through a seed being attained by a ferment; and that the seeds being exhausted or overcome with pains, Bodies do at length return into their ancient Inne of water: yea that ferments do sometimes work more strongly than fire, because great Stones are turned into Lime, and Woods indeed into ashes, and there the fire makes a stop: the which notwithstanding, a ferment in the Earth being assumed, do of their own accord, return into the juyce of *Leffas*, and so also at length into simple water: For otherwise, Stones and Bricks do of their own accord decline into Salt-peter. Lastly, Glasse which is unconquered by the fire, uncorrupted by the Air, in a few years putrifieth by continuance,

tinuance, rots under the Earth, and undergoes the lawes of water: for whatsoever things may be melted in water, do forthwith return into water; but other things are made volatile by the *ferments*, and what things soever were compacted, and not to be thorowly mingled, being brought by the *ferments* of *putrefactions* by continuance, into a necessity of transmutation, are opened, and do hastily consult of seperating. But the most clear Fountains, although they climbe thorow the Rocks and Sand, out of the un-favoury soil of *nature*, or the *Quellens*, are purified far from the contagion of Clay, a *ferment*, and *corruption*: neither do they also fall down by chance, but are appointed for great uses: yet seeing they contract at least the hidden *Odoours* of the Rockie Stone, unperceivable by us, they hasten into other boundes. Therefore, *Streams, Springs, Rivers, Fens, Pooles, Seas*, and whatsoever things are contained in the belly of the *water*, do likewise, even from the very birth of the Fountains, conceive their seeds, and in wantonizing, do ripen them by their course. Also great storms of Rain, being struck down through the putrefaction of *Thunder*, are fruitfull; but sober rains are great with young of dew, or a conceived exhalation: For I have perfectly learned by the fire, that the dew is rich in a sweet Sugar. They deliver, that in Snow, *Northern worms* are bred: therefore the Mountains to be covered over with a long Snow; and although their Grasse be sparing, yet that it is most apt for the fattening of lesser Cattel; so that unless they are driven away in time, they will be choaked with fat.

But the waters which contain a melting, *Paracelsus* doth call corporeall ones, and he ignorantly denieth that they contain an Element in them. Therefore *Ferments* do by seeds play their univerfall part in the World, under the one Element of water.

CHAP.

CHAP. XV.

The Stars do necessitate, not incline, nor signifie, of the life, the body, or fortunes of him that is born.

1. *Naturall Philosophy without Medicine, wants its end.* 2. *The objects of the Stars.* 3. *By what Argument the admittings of Ephemerides or Dayes-books may be supported.* 4. *The error in admitting them.* 5. *However influences may be taken, they do alwayes include a necessity.* 6. *What the Works of the Lord in Plal. 14. are.* 7. *The fore-knowledge of God is infallible as well in things freely happening, as in those of necessity.* 8. *Death is foretold to Hannibal.* 9. *How the Devil foreknoweth things to come.* 10. *The Confession of the Authour.* 11. *How much and from whence an evill Spirit hath a foreknowledge of things to come.* 12. *Which way foreshewing Signes may be made, which scarce any one understands.* 13. *The foreshewings of the Stars determined out of the holy Scriptures.* 14. *In what manner, or what thing the Stars may act.* 15. *The action of government.* 16. *A diversity of government is shewen from their motion, and from their light.* 17. *Sick persons foreshew things to come.* 18. *Why Insects have better known things to come, than men.* 19. *VVhy diseased persons do fore-perceive Tempests.* 20. *Foreshewing doth not take away a liberty of judging or willing.* 21. *The figures of the windes are described in the Heaven.* 22. *The knowledge of the signification of the Stars, is unknown to man.* 23. *The Magitians or wise men of the East.* 24. *From new Wine, Sooth-sayers or Diviners of God.* 25. *The Prophecie of Feasters was from new Wine.* 26. *That the drunken or besotted gift of Paracelsus was made known to the Hebrews.* 27. *Three histories of predictions.* 28. *The Stars onely to incline, resisteth the Scriptures.* 29. *The inclining of the Stars, how far it reacheth.* 30. *The Stars the solemn prayes of God, do not necessitate as causes, but as signes bewraying the will of the Lord.* 31. *A solving of an objection.* 32. *The common explaining of the Proverb, derogates from the Grace of God.* 33. *That the Heaven doth not incline.* 34. *The seed of man doth of its own accord destux into a living, animall, and dispersing soul.* 35. *VVhat the seminnall properties of inclinations are.* 36. *A fourfold inclination.* 37. *The inclination of calling, is onely from God, but not from the Stars.* 38. *The morall inclination, is from the seed, and from education.* 39. *The inclination vitall or of the life, is from the seed, and education.* 40. *The vain and proud presumption of Astrologers.* 41. *The inclination of fortunes is immediately from the hand of the Lord.* 42. *The Schooles seduced by the evill spirit of Paganisme.* 43. *The sloathfull or careless negligence of Astrologers.* 44. *How the sensitive soul of man differs from the soul of a bruit beast.* 45. *How custome brings forth inclination.* 46. *How a wise man shall have dominion over the Stars.* 47. *Why predictions from the Stars are fundamentally vain.* 48. *The error of the Authour.* 49. *Astrologers confess their deceits.* 50. *They suppose astrall or Starry effects from causes not in being.*

I **H**itherto concerning the Elements, their qualities, Complexions, and contrarieties, in order to the Science of Medicine, without which indeed, I have thought the Study of naturall Philosophy, to have lost as it were its end: no otherwise, than if a Clergy-man shall

shall treat of the State politique, or of War-like affaires: For why, *S. Paul* drives every Sacrificer from the like things. *No man* (he saith) *going a warfare, intangleth himself with the affaires of this life*: Therefore, the Studies of naturall Philosophy, have I directed to a farther end, to wit, to the profit of men, but not to the delighting of the Readers: For this cause also I declame concerning the Stars, because they are thought to be the causers of any kinde of Diseases, Inclinations, and Fortunes. And indeed, *Paracelsus* at length consented in this thing, although he be refractory in all other things, to the Study of the Antients.

First of all, I will take the Text: *The Heavens declare the glory of God, and the Firmament sheweth his handy works*. For that soundeth, that the Heavens were chiefly created, that they might declare the large Majesty, Power, Goodness, and Wisdom of God: to wit, on which four Pillars the whole Globe of the Universe stands, and is supported: but the Star-bearing Heaven doth as it were a Preacher, shew the wonderfull works of the Lords hands to intellectuall Creatures: For thus far the Church admitteth of Meteorical Predictions, the barrennesses of years, and their fruitfulnesses, the stations of sowings, the dangers of sailings, the deaths of chief men, Plagues, inundations, yea, whatsoever things do not depend on the direction of our will or judgement: to wit, as all those things are believed to be connexed with the first qualities of the Elements, by a contingent or accidentall consequence: even so that, although it doth admit of the deaths of great men, the tumults of Wars, and fires, to be prognosticated of in *Ephemerides*; yet it will have those things to be beheld, not as free contingencies, or arbitrall, and much lesse as necessary ones; but nakedly, as it were the effects of the first Qualities and Complexions. Wherein, how much they have erred, I have already demonstrated in the premises: And moreover, how far they have in this thing gone back from the holy Scriptures, I will here shew. If the Heavenly influences do obtain the reason of a cause, surely their effects shall of necessity be connexed to their causes, and so also thus far at least, necessary, after the manner of other second causes; whose effects, the causes being placed, do necessarily succeed, unless they are supernaturally hindered, or changed.

Which thing is alike proper to all causes, neither doth it include a singularity for the Heaven: but if the Influences of Heaven are onely after the manner of a sign and fore-shewing; surely, neither shall they import a lesse necessity; but a far more strict one, if we believe the certain foreknowledge of Divine Providence, and do believe, the Handy works of the Lord to be fore-signified by the Stars. Therefore, after what manner soever it may be taken, the Stars do necessitate. *The Stars shall be unto you for Signes, Times or Seasons, dayes and years*. But these Works of the Lord shewed from a necessity, by the Stars, and by the Firmament, are not the works of the first six dayes: For neither could the Stars shew forth either themselves, or what things were created straightway after them, without an absurdity of speech. In the next place, the Stars ought not to foreshew Winter and Summer, which they actually cause by their Blas, and which we do ordinarily know, and perceive to invade us by degrees: but they ought indefinitely to foreshew the Handy works of the Lord, and rather those which are called contingent ones, than otherwise, necessary, and ordinary Revolutions: Which contingencies do not therefore respect the fruitfulnesses of Victuall, which they do cause; but for the Majesty, Wisdom, and goodness of the Creator, the Stars ought to foreshew those future Handy works of the Lord, whence he hath taken to himself the name, the God of Armies, by whom Kings reign, a zealous God, a revenger, translating Kingdoms from Nation to Nation by reason of injustice: which kinde of works are contained in the life, birth, vertue or power, continuance, change, interchange, motions, and interchangeable courses of successive things: And so the preachings of the Stars must needs have place in the removing of Scepters; and by consequence, in the foreshewing of the meanes by which those things are done, framed, do depend, and subsequently follow, as it were by second causes: For such kinde of effects, are not to be taken away from the Handy works of the Lord, without blasphemy. Therefore of this sort, are also Tempests, Earth-quakes, wonted and unwonted floods of waters: For the Lord of Hosts giveth Scepters to the Shepherd, which he taketh away, and translates from the King, by reason of the injustice of Kings, the Clergy, and Judges. Therefore by consequence, the Stars do foreshew this injustice also, If the translations of Crowns are the works of the Lord, if the lots of all men do stand in the hands of the Lord: For neither doth Faith permit fortune, or misfortune to be else-where, or to be expected from else-where: For he is the Prince of life and death, the *Alpha* and *Omega* of all things, He giveth, and taketh away Victories, Wars, Famine, and Pestilences; also second, partaking causes, also free mediating con-causes, and occasionall ones accompanying them: over all which, notwithstanding God is, sits as chief, as the totall, immediate, and independent cause. Therefore the Firmament is a preacher of all these Works: for neither doth God more

erre in these free contingent things, than in animall, accustomed, and necessary things, if the Firmament was made by God, (the Mover and knower of all things) to foreshew.

8 The Land of *Libyssa* shall over-cover the dead Carcase of *Hannibal*, as *Appian* relates it to have been foretold by an Oracle of the evill spirit. *Hannibal* hoped (he saith) that he should therefore die in *Lybia* or *Africa*, who died in *Bythimia* near the River *Libyssa*: For the Devil cannot foreknow the lots, or events of future Wars, which are in the hand of the God of Armies, and as yet in the future will or judgement of man, unless he shall first read them decyphered in a fore-telling Star.

9 Which Picture of the Stars, while they no where finde mentioned, but cannot deny but that the Devill declares things to come; they have meditated of a privy shift, and do say, that the knowledges of future things are nearly related to Angels, and so are co-natural to them: but that they differ according to the Quires or Regions from whence they were expelled: so that, they which fell down from the highest Hierarchy of the Angels, should have a much more clear understanding of future things; which understanding, because it was naturall, God had not took away from an evill Spirit: For neither is it more naturall to the Devil to have known the enlightnings concerning future things, than to have known the natures

10 and names of living Creatures not seen before, like *Adam*. But I conceive with *Dionysius*, that the inferior Angels are enlightned by the superior: but this light continually to beam forth from the wisdom of the Father, and never to have been natural to Angels, but to be a free and beatifical gift. Next, that every good gift doth descend from the Father of Lights, that the gift of the Counsels of God, and of his future works is not to be searched out by Creatures, by their gifts of nature: else, the naturall knowledge of evill spirits, should be almost infinite, if it should include in it self, the fortunes of mortall men to come, distinguished in their second causes: yea if an evill spirit, otherwise, had had this natural participation of divine counsel, he had not been ignorant of future effects, which he himself as the fire-brand of all evils was to raise up, and suffer; and so he could scarce have sinned. Therefore it

11 is more safe to believe, contingent or accidentall things to be painted out by the Stars, not indeed all, but perhaps those of one age: and likewise, the Tragedy of every man to be deciphered in his own Star; the Picture whereof ceaseth, with the closure of his life. They will say, *Hannibal* took poyson, Satan periwading him: But this he did not certainly know, as neither could he foretell it, if man hath free will, and therefore neither did he know that *Hannibal* would certainly obey his perswasions: neither doth *Hannibal* die by the foolish perswasion of Satan, which could not be knit to its causes depending on the divine will: For neither doth he die by the poyson, but first he is a run-away from many adverse battels: But the Lord, the onely God of Armies, hath Victories in his own hand, neither is the evill spirit chief in Battels: Therefore to have foreknown the issue of Wars, is the same, as of free contingencies: For truly, Victory doth for the most part arise occasionally, from a contingent thing not premeditated of: therefore I conclude, that the infernal enemy doth read the Pictures of the Stars, whereby the Firmament is said to foretel the Handy works of the Lord.

12 But thou wilt say, whence do the Heavens make Predictions, which no mortall men have known, and the which to be known by the evill spirit, is wickedness? In the first place, it should be sufficient, that the fore-tellings of future things do chiefly declare the glory of God, and the infiniteness of his wisdom, and fore-knowledge; to wit, that it may not remain ungnified. And then, *The Lord hath not done a word, which he doth not signifie to his servants the Prophets*. Lastly, if the number of mortall men, be scarce the hundreth of Angels that are good Spirits: it sufficeth, that these at least, do read the foretokens of future things, and therefore do they praise the Lord anew. *Lucifer* indeed hath waxed proud by the much knowledge of things, both of those that do exist, and of things afterwards to be, and it was naturall to him, the which he breaths in without grace: But it doth not therefore follow, that he hath known all mortall men to come, and their fortunes, vices, defects, sins, grace, and whatsoever things should be hereafter, like to a second cause; as neither the secret myteries of God, that are revealed in succession of dayes, and added to a connexion of causes. But, whether Plagues do arise, and rage, or Tyrannies, Wars, destructions, tumults, or the beginnings of arch-Heretics, the Lord permitting them, at leastwise those things shall be as well connexed to their own necessary, and second causes, although arbitrall and occasionall ones, as otherwise, Meteors are to theirs: For neither is the office of foreshewing the Handy works of the Lord to be restrained to the changes of the Air alone; but absolutely unto all the works of the Lords hands: Because if the Stars can be preachers of the threatening effects of the wrath of God, which without second causes should be committed to the smiting Angel: why shall they not also, in like manner, shew the works of the Lord deputed or reckoned to

second

second and free causes? For truly, what things soever God foreknoweth, he can also, if he will, shew them by his Instruments: but those proper Instruments of God are the Firmament, and the Lights thereof, as the Scripture witnesseth.

Yea truly, I have been bold to attribute more Authority to the Heaven, than what hath wont to be given unto it by the holy Scriptures: To wit, that the *Stars* are to us for fore-shewing Signes, Seasons, or changes of the Air; lastly, for dayes, and years: wherefore the Text takes away all power of causes, besides in the abovesaid revolutions of seasons, dayes, and years: Neither do they act, I say, but by a motive and alterative Blas. But the *Stars* are said to act by motion and light onely; but motion in the Schooles is said to act onely by reason of the divers Aspects of Light; for, that the motion of the Heavens, even the swiftest, as well as those remote from us, should produce as well heat, as motion; is a devise or fiction. For truly, the daily motion of the Heavens is almost equall, therefore also the heat should be alwayes alike: but seeing the property of Light by it self, is not but to enlighten, but by accident, by reason of its conjunction, to make hot, or make cold: and the dayes are now and then cold, and Clowdy unto us, under the Summer Solstice:

Hence surely I ought to have borrowed other causes from the Blas of the Heaven. There is a certain action indeed, hitherto unknown to the Schooles, which in the proper limit of government I have taught, which operates on the objects subjected unto it, almost like to abstracted spirits: And even as the Soul moveth, and altereth its own Organs or Instruments: Thou mayest call it for me, an influence, so that a connexion of the Stars be moreover understood, of stirring up the Gas beneath, according to the lawes of directions given, and fixed by the Almighty: for otherwise, seeing that a beam of Light may be hindered by a covering, every Blas also of the Stars on us should cease, if they should act on us onely by light, and motion: yea, and in an over-clowdy Heaven, no action on the waters, or on the things sown in the Earth, should be beheld: For diseased persons do perceive a proportionable resembling motion of the Moon, and for this cause do they foretell Tempests to come; because there are in the very seeds of things, the co-bred, and allied Lights of Heaven, Which do suit themselves to the motion of the nearest, or Neighbour-lights, and so to the most universal Blas of the Stars. For therefore, hot-Houses being shut, the same effects are felt concentrated or harmonious: not indeed, because they light on us from without; but we carry a heaven within, in our vitall beginnings, and the Almighty hath sealed things soulistified with that Pledge or Signet. Notwithstanding, that con-centring, and conformity do signifie a connexion of suitableness with the more large superiour Heaven.

And moreover I may easily believe, if Insects do utter the foreshewing signes of seasons, that we also at the time of health, might foreknow all things, unless corruption had bespattered our whole nature in the ground, and had left us naturally so much the more stupid, and miserable than those small Beasts: for sin hath withdrawn the Celestial familiarities of talk from us: in diseased persons onely, it hath left its marks of ancient foretelling; whereby we may know, that the marks of things to come are left us from nothing but the misery of corrupted nature: which else, in her purity, had made us true diviners of the Heaven, no lesse than *Adam* knew the natures of living Creatures. And although the Stars do foretell the effects depending on free, and contingent causes; yet I would not be understood, that a gift is given to the Stars of bringing in the causality of future things: for it is sufficient, that in this thing they perform the office of a Preacher, as it were meanes depending on the fore-knowledge of God: for as the fore-knowledge of God doth not take away from man a liberty of willing or judging, and his tie with the fore-knowledge doth not take away the infallibility of events: nevertheless, it least of all contains an unavoidable necessity: much lesse doth the fore-telling of the Firmament induce any necessity of contingency, or accidentall event on the wills part, although it doth altogether happen in respect of events coupled to their free causes. Truly I have oft admired at those that refuse a denouncing of the Stars in free causes, as though they did therefore necessitate, and did take away a liberty of willing, when as in the mean time, they do admit, that divine fore-knowledge doth not cause anything against free will, but that it can denounce: Seeing the reason of necessity in the fore-knowledge of mans glorification is far greater in the power of God, than in the fore-shewing of the Stars, if being of its own nature tyed to change by reason of the repentance, and unstable or frail nature of sinners. For it hath happened, that sometimes the Stars have foreshewen onely threatenings, whereby the ancient mortalls through the terrour of punishment, do return into the way, as did the *Ninivites*: In which case, although the Stars do loose much of their certainty, and strength: yet they do not forsake a certainty of necessity, as oft as the Signes do shew forth the fore-tellings of Events,

Wherefore, I reckon with my self, that the figures of things, successive throughout Ages, are decyphered in the Heavens, as it were in Tables (which figures, they name the lawes of destiny) and that, not indeed, by an *Hebrew* Alphabet (as some of the *Rabbins* Dream) but that Provinces, Kingdoms, and men, have their Stars, on which the Stage of things accidentally happening to their Subject, appointed for every one of them in the revolutions of dayes, is decyphered: wherefore neither is it a wonder, if evill Spirits shall know how to foretel many of these things: And so much the lesse, if to every one of us, are designed good Spirits our keepers. Even as the Mountain *Garganus*, Kingdoms, and Common-wealths, have Spirits for their own Rulers, and Defenders. For so the fore-shewings, not onely of the rising, and period of Kingdoms are therein painted forth; but also the races, and ends of all men are historically figured out by their peculiar Star, which are also typically decyphered.

22 Which knowledge indeed, although it being known to Spirits, naturally forbidden to man, I do oftentimes read it by its true name, the divining of the Heaven, yet, I finde it granted onely to the Servants, or Prophets of God, according to his good pleasure. For your old men shall dream Dreams, and your young men shall have Visions, and shall prophesie; for this which containeth all things, hath the power of a voice, it openeth future contingencies shewed by their Stars, onely to whom, and when it will.

23 On some in the mean time, he bestoweth a figurative knowledge of the Stars, even as to the wise men of the *East*: but to others, he giveth Dreams, as to *Joseph*, and the same wise men; and that the same may be truly interpreted, as to *Joseph*, and to *Daniel* a man of desires. Also there are some at this day, as mad men, and drunkards, fore-telling things to come, and not knowing, what, to whom, in what manner, or by what meanes, or why they do preface: For so according to *Josephus*, *Jesus*, a certain man, foretold the destruction of the holy City with a continuall cry, and for that cause, he was beaten. But the Apostles spake from the Comforter, with the Tongues of all Nations which were then under the Sun; but by the *Hebrews* and *Pagans*, they were accounted to be drunk with new Wine. Although there was no new Wine thento be found in *Palestina*: For they prophesying, glorified the Lord *Jesus*:

24 for neither is it read, that any was then preached unto, or converted. Therefore they were accounted to be drunk with new Wine, but not with Wine, because drunkenness by new Wine, among the Gentiles, did stir up, those that kept *Bacchus*'s Feasts, to Predictions.

25 Therefore Prophecie from new Wine, or otherwise foretelling, seemeth to be in some men, almost foolish, but if they were drunk, familiar: which constitution or frame, *Paracelsus* calleth a drunken or besotted gift, which was made known to the *Jewes*, and therefore falsely attributed to the Apostles.

26 Moreover, that I may demonstrate, the events of men to be described in the Stars, I will shew at least three examples of diabolical Predictions, instead of a thousand: nor those drawn out by the evill spirit from any other place than out of the decyphered figure of the Stars.

27 First of all, *Roderick* the fourth, the last King of the *Gothes*, reigning, the Castle of *Teletum* which had now stood shut even from the dayes of King *Bamba*, was through the curiosity of *Roderick*, opened; but there was nothing found in it, besides one onely Chest: But in the Chest, a Cotten Towel, rouled up, shewing the Garments, and Persons of the *Africans*. But there was in it thus written, *When this Castle and Chest shall be unlocked, a Nation shall break into Spain, of this similitude and cloathing, and shall obtain Victory over the Spaniards*. But the *Moores* were decyphered with a cloathing, as it was to be above 200 years after. Two others are modern examples. The Duke of *Biron* being apprehended by his King, for the crime of Treason, straightway busily enquired, of what Nation the tormenter or Executioner of *Paris* might arise: whom, when he understood to be a *Burgundian*, he fearing, sighed, and said: *Alas, I am undone!* for truly he had sometimes understood by a *Soothsayer*, that he was onely to beware of a mortall stroak, which a *Burgundian* was to give him in dayes to come. The Earl of *Lonigium* was slain in a Duel nigh *Bruxels*, itching with a desire of Combates, and being the more bold, because he had understood by Fortune-tellers, that he should be mortally wounded by a *Wolf*. But there was a young man, a Companion in the Duel, to the Earl de *Sancto Amore*, whose Sur-name was *Loup*, or *Wolf*, who being deadlily pricked, thrust *Lonigius* thorow. Let the Devill be the Authour of these Predictions. But it is at leastwise of Faith, that the Lots of every Victory, are in the hand of the Lord. Let us grant, that the Devil stirred up *Roderick* to open the Chest, and also to have pricked on very many Kings of the *Moores* to invade *Spain*; Yet he could not know, that he was to obtain this, beyond the will of so many persons: much lesse, that the *Arabians* should obtain Victory (which the Lord alone gives to whom he will) unless he had first read the content of the

the Lord, painted forth in the Stars : for neither could the evill spirit have known this by the motion and Light of the Stars, that was to come for two Ages from thence. In the two other Histories, the Devill, besides the houre and place, had foretold also the Nation of the killer, and his name : but at leastwise a name is not shewen by the Planets.

Moreover, the divulged Rule; The Stars do incline, but not necessitate, hath seemed to me contradictory to the Text of holy Scripture; *The Stars shall be to you for Signes, seasons, dayes, and years* : because it is not lawfull for any mortall men to extend the bounds, effects, or appointments of the Stars, above, without, or besides the intention of the Creator. Whether therefore they are for fore-shewing Signes onely, or at length, for causes of *seasons, dayes, and years* : Seeing that they are meanes for both ends, which God useth as second causes, they ought to have a relation of necessity, by reason of the certainty and independency of him whose meanes they are.

But so far as it hath regard to inclination, which the Schooles do grant to the Stars ; it nowhere appeareth in the holy Scriptures, that the Stars are to us, causers of inclinations ; but as oft as the Stars are the causes of causes, so oft also, they are the necessitating causes of the thing caused, by the meanes of other second causes. For the Sun doth with no lesse necessity bring on the day and Summer, than burning or flaming straw under a dry Fagot, doth kindle this Fagot. But when Stars do obtain the nature of a Signe, Preacher or Messenger : then also they do not exceed the conditions of a presage, nor in any wise assume the office of a cause ; but they do onely then foreshew from the infallible fore-knowledge of God, and so also do import a necessity as much as is from them, and from mans free will, as fore-shewing Signes of the Handy works of the Lord.

And although they do not necessitate causatively, things to come, yet they do necessitate as they shew the will of the Lord. For free contingencies do depend on their causes, also sometimes primarily on those not intending such kinde of effects which by divine permission do proceed from thence unthought of : for neither in the mean time, are those things which come to passe from free causes immediately, understood in any respect to be inclined by the Stars (although fore-shewing ones onely) to produce their effects : For truly, a strong native, continuall, solliciting, repeated, &c. inclination, doth after some sort import a necessity over free will, which I do not indeed grant, in the least point of it, to be inclined by the Stars.

For even so as a friend is not the inclining cause of War, or the inciting cause, if he doth secretly declare to his Prince by an Epistle, that an enemy doth prepare War, and plot the invasion of his Camp. But the Schooles defend themselves by that saying : *A wise man shall rule or have dominion over the Stars*. As though, if the Stars should stir up any one to murders, thefts, man-slaughters, adulteries, seditions, drunkenness, &c. yet a wise man, might by the liberty of his own free will, make those inclinations void ; and this they call, to rule over the Stars. But surely the authority of the Scriptures being badly understood, brings forth perverse consequences. For, first of all, it is not in a wise man, to resist evill inclinations : but it is of grace : And so, a wise man in this place, is not understood to be him which is fenced with sufficient grace : because if he shall rule over the Stars, there is no cause why he should fear conquered inclinations, even as, the word, to dominate or bear rule doth import ; yet this is false throughout his whole life. Next also, they presuppose a fallhood, because it is by no meanes of the appointment of the Stars, that they should cause inclinations in us : but onely, that they are for *signes, seasons, dayes, and years* ; and no more. In the next place, the Heaven was created without spot : Therefore it is absurd, that it should be unto us in the room of the Devill the Tempter, and which is more, of an incliner : because it should infuse into us a continuall fewel unto vices, and a headlong inclination. Far be it, to think these things of the divine goodnes. Every evill inclination, doth not come unto us from without, elsewhere ; but it hath increased it self within, from sin. *Out of the heart, are murders, Adulteries, and evill thoughts* : surely not from the Stars. Therefore according to a humble Protestation of my slendernes or weakness, I do utterly renounce the opinion, teaching, that the Stars have a power of infusing an inclination. For I was in the beginning, held in opinion by divers effects, that the seed of a Beast did of its own accord flow into a living Soul, and that not obscurely running to and fro : and although that in the conceived *Embryo*, or imperfect young, first of all a certain power doth clearly appear, as if it were a certain vegetative Soul ; yet the same is at length perfected, and ariseth into the degree of a sensitive soul. And seeing that the seed of man is not more imperfect than a beasts, I did also suppose, that to flow with the like pace, and at length to be perfected into a sensitive soul ; yet, not so, as that this sensitive soul doth likewise passe into the nature of mans minde : For since two Masters at once, not subordinate to each other,

no man can serve, but he must hate either of the two, because they are unsufferably opposite: So in nature, one onely body cannot serve two determined or limited souls; and the sensitive soul is not a substance; nor lastly, an accident (as I shall teach in the Chapter of forms) but the minde of man is a Spirit, also a living substance in the abstract, and immortall: hence indeed it comes to passe, that the sensitive Soul surviving, nature doth also willingly receive the humane Soul, or its perfectly ultimate act, and that both Souls do peaceably suffer with each other within.

35 Which thing being premised, I began to consider, that a Dog is a devouring, biting, envious, watchfull, barking, and hunting living Creature, and for one crust, unmindfull of all benefits, ungratefull, flattering, &c. All which things, as feminall properties, and specificall ones, are in the seed of a Dog, but not imprinted on him by the Stars; but I have known very many of those properties proper to the kinde; but some of them to be moreover, peculiar to them from their Parents: Even so that from hence, the race of Dogs doth differ in price or esteem: Therefore, I have known the like conditions to be in a Dog from the stock of the Seed, and not astrall or from the Stars; and so, where I have beheld the like conditions in a man, I have also presently thought, that these have from some Dog-like property lurked in the seed of man. Again, I have noted some living Creatures, to be conjugall, but others to be born by a promiscuous, and incestuous copulation: So I have noted, tame, wild or brutish, crafty, uncapable of learning, theevish, cruel, fugitive, fearfull, milde, &c. living creatures: which conditions, as being common to the whole kinde, or dispersed throughout families, I have learned, not to arise from the Stars, or from the Planet that is Lord of their Nativity; but wholly, and onely from the seed: And therefore I have also likewise thought, that such inclinations of men do increase in him that is born, from some brutish property of the seeds. I have also found amongst men, oft-times, whole families to be furious, stupid or blockish, crafty, insolent or proud, lascivious, &c. Whence some are called, a *viperous generation*. Likewise, *Tell ye (Herod) the Fox*; wherefore I have begun to remove wit, judgement, memory, manners, inclinations, yea, the dispositions of death, and fortune, wholly from the Stars. Again, it is also in the hand of the causer or begetter to generate a male, or a female; but masculine conditions, inclinations, wits, properties, are far distinct from female ones: For the Church prayeth for the devout femall Sex: wherefore morall inclination, or devotion, is due to the Sex, not to the Stars: For Horses are judged by the colour of their hairs; but colours are varified in conception, by art. Moreover, conditions, and inclinations are changed by ages: To wit, Children are delighted with other things than men: For a sober young man sometimes becomes an old drinker, and on the contrary. A liberall young man is oft times covetous when he growes old: Also a greedy desire of Seed (which he lesse wanteth, and ought lesse to desire) doth oft accompany him: which surely do not depend on the direction of the Stars, if the same Lord of the Nativity doth govern the whole life.

36 For truly, I have distinguished of inclinations: to wit, that one is that whereby any one doth naturally incline into Professions, Religions, Arts, Sciences, Merchandise, or affaires of Exercise: This I name, an inclination of ones Calling. But the other inclination, concerneth manners, virtues, vices, which I call morall, or ethicall: But the third respecteth, health, Diseases, a long, or short life: And therefore, I name this inclination, virall. At length, the fourth, is of fortunes. But so far as belongeth to the first, we believe by faith, That God immediately creates mans minde, and directs it to a certain Calling of its own, in which it may please it self most; which way, he reacheth to it worthy Talents, 5. 2. or one onely Talent.

37 Therefore the inclination of Calling, whereby any one is made a Physitian, a Geometrician, a Musitian, &c. is given to the Soul by the Creator himself, from whom every good gift cometh from above: Therefore all inclinations of Calling, for that very cause are good.

38 But a morall inclination, as it is meerly Beast-like, so, I have already demonstrated before, that it dependeth on the Being of the seed: For truly, the Stars should be simply evill if they should incline man to vices: And the Creator had erred in judgement; Because he had seen that whatsoever things he had made, were good: Therefore an inclination to evill, springs from nature corrupted in its Roor, and Seed: out of the heart do spring evill thoughts, according to Gospel-light, and from the Soul, consents; even as a strong inclination, from a custom of sinning: But good, springs from grace, will, and exercise. Surely it is in no wise a stranger to us by reason of the Stars: For the first things which constitute us were equally defiled by corruption; but unequally distributed, and participated of from the goodness

goodnesse of the seed, the conception of the Mother, education, &c. or on the contrary.

And therefore all inclinations seminall, do grow, are increased, or do decrease according 39
to the properties of the flowings of the seeds to increase, or declining.

But that the third inclination, is from the weakness, or strength of the seeds, and wholly 40
subject to the Archeus the director in nature, none but an Astrologer will dispute, who being
ill prepared, refers all things to the motions of the Stars, even unto Idolatry; and attributes
to himself the right of unfolding them: first of all, not distinguishing the power of shew-
ing, from the effective virtue: nor knowing that the seven Planets or wandering Stars are
onely to be chief over the Blas of the Elements; But that the fixed Stars do contain parti-
cular Tragedies: And therefore, when besides the wont of nature, there shall be signes in
the Sun, and Moon, they do signifie the monstrous signes of a future ruine of the Universe.
But such blockishness hath more and more grown on the common sort, that they think every
one must be believed in his art: in this indeed rightly, That the Astronomer hath learned
to measure the motions, and distances of the Stars: But we must not therefore believe him
as a Prophet of the Stars; unless he shall also bring very authentick or warrantable marks
whereby he may be believed, as did *Aholiab*, and *Bezaleel*. Therefore as to the vitall incli-
nation, I do praise the Proverb: *Strong men are created, by strong, and good seeds or*
Parents.

Moreover, so far as concerneth the inclination of Fortunes; That in its very Etymology hath 41
exceeded the Catalogue of inclinations: Therefore I think that all the fortunes of
all, as well those prosperous, as adverse, do concern a divine disposing, but not an in-
clination, much lesse to depend on the Stars; although they are fore-signified in the
Firmament.

For truly this fore-signifying also, doth plainly shew, that those do depend immediately 42
on the will of the signifier: For *our lots or conditions are in thy hands O Lord*: Therefore
I believe that all the lots of all, are good in themselves, and to be fully in the hand of the
Lord. I believe moreover, that, by how much the more remote any one is from this opinion,
by so much he is nearer to Heathenisme. Indeed the Heathenish Schooles did see that living
Creatures had suitable inclinations according to their kinde; yet being amazed at the plura-
lity of morall inclinations in one onely humane kinde, expressing all the inclinations of all
Beasts, and therefore not knowing in what cause they might settle so great a number of incli-
nations; the evill spirit perswading them, they by their Sooth-sayers of the Heaven,
confusedly fled to the uncertain, and momentary coupling, and estranging of the
Stars.

Never searching into the cause, why mankind is capable of many bestiall inclinations: For 43
they neglected to consider that bruit Beasts should have their specificall inclinations from the
Being of the seed, not the signe of the Horoscope to be due to bruit Beasts. That man likewise
had his inclinations like bruit Beasts: wherefore in like manner, Nativities are not to be
searched into for the inclinations of men: For neither do they naturally happen to man
from any other place than from a part of his body, which wholly, whatsoever it is, it oweth
to the seminall Being, no otherwise, than the bodies of bruit Beasts do: For truly the Soul
is immortall, wholly simple, and uniform; and seeing it is immortall, it cannot have its in-
clination from the frail, and sliding motion of the Stars; but onely it hearkeneth to the na-
ture corrupted by sin, in *Adam* and his Posterity: Wherefore in a late or young Nephew,
do oft-times the manners, behaviours, and inclinations of his Grandfather not before seen
by him, rise again: Indeed the Schooles also are content that these should be given to
the Being of the seed, and not to the Stars: But being lulled asleep through a custom of as-
serting, and by the importunities of Astrologers, they have neglected thorowly to weigh,
that the aforesaid inclinations of the Grandfather are of no other dignity with, nor se-
parated from the company of the other inclinations; and therefore that they are tyed
by the same Law, to the Being of the seed: I know not how deservedly they do
as yet teach to this day, that a man is so subjected to the Stars, that he is conti-
nually rempted by them, to wit, that the morall inclinations of vices, and goodneses
are to be drawn from the houre of ones Nativity: But surely, God hath appointed
man in the hand of his own will: For the sensitive Soul, the vicareffe of the minde,
doth surely rejoyce in a greater liberty than the souls of bruit Beasts, by reason of
the Seals ministred to it by the minde.

But

But the souls of bruit Beasts live contented with the inclinations of their own particular kinde, under a small latitude; but mans sensitive soul is enlarged to all inclinations: for as a humane young, as soon as it begins to be nourished in its own square or quarter, is not a plant of any kinde, even as neither a bruit of any kinde, while the sensitive soul floweth together with the rational: So the sensitive humane soul being not tied to a brutall kinde, doth wander through all the latitude of brutall inclinations, and easily hearkeneth to the strange inclinations of the immortall minde brought into it at its own pleasure: for the minde sliding into corrupted nature, doth easily fall into the motions and enticements hereof, and being alwayes shaken out of its place by an unbridled appetite, doth serve as a Lackey or Chambermaid to disturbance, which hath driven it from its place: Whence, there is a strange inclination: By the frequent use, or desire whereof, there is a strong custom, which at length doth imprison the minde. It likewise appeares, that a morall inclination is in the innermost properties of the sensitive soul, dispositively sliding out of the Being of the seed: And that the Stars have obtained over us, no power of causing, except by the Blas of Meteors. But although the inclination of calling, or a morall one, may change the vitall inclination: as when a pruner of Trees becomes gowty, a brawler is wounded or slain; so a Gilder miserably trembleth, a digger of Mineralls, and likewise a Chymist perisheth by an *Asthma* or stoppage of breathing; yet those things come to passe occasionally onely, neither do they bring with them any right to the *Astrologer*. Cease therefore for shame, hereafter to believe, that the Stars were created to rempr, incline, destroy, make happy, infuse Sciences, or to prevail by an acquired right or authority: for thus is the power of desert or punishment taken away, also a way is opened to Atheisme, and the fatalities or destinies of appointments.

Therefore a wise man shall rule over the Stars: not indeed, that he can hinder, change, suspend, and pervert the courses, or lights of the Stars; as neither the successive changes of times or seasons, dayes, and years following from thence. Therefore it followes, that a wise man shall not rule over the effects which are coupled to the revolutions of the Stars, as causes; neither shall he rule over the Stars, as signes, to wit, that he is able to change them at his pleasure: but he onely foreseeing, that the seven wandering Stars are about to stir up a motive, or alterative Blas, whence barrennesses, colds, heats, dearthnesses of Victuall, or the like, do necessarily follow, he shall be able to provide himself with necessaries, and so by meeting the discommodities bred by the Flux of the Stars, he shall from consequence, in some sort rule over them. An *Astrologer* with this authority, not exceeding the bounds of a Meteor, is reckoned by the holy Scriptures, among wise men: Which square, if Astrologically Predictions shall through a rash boldness exceed, they are not onely vain, and conjectural; but driven out of both Testaments of the holy Scriptures, with the name of Sooth-sayers of Heaven: So that St. *Ambrose* doth rightly compare them to Spiders Webs, which indeed do serve to take flies, and gnats ensnaring themselves, but by a stronger living Creature they are most easily broken asunder: So indeed these Predictions, do catch onely those that are apt to believe, and lesse firm in the faith. But that they are vain in themselves, and framed by conjecturall Rules, I prove, because they are supported with a double foundation, to wit, with none at all, and by a false one: that which concerns nothingness, is, that they will have attributed to the Seven Planets, the figure, inclinations, strength or valour, wit, fortunes, and death of him that is born; Seeing God hath appointed the Stars onely for signes, seasons, dayes, and years, but not for the causes of Predictions: And so, if those Predictions do contradict divine appointment, for that very cause, they are null, and false. Secondly, because it is not yet agreed among *Astrologers* hitherto, concerning the Scheme, or order of the Heavens. To wit, whether *Mercury*, and *Venus* are carried in particular Orbs beneath the Sun, according to *Ptolomy*, and all the ancient Judiciaries; Or whether they are rowled about in like or equall Circles, round about the Sun: Which thing, the Optick-Tube or Glasse hath thus searched out: therefore the Aphorismes of Predictions supported by that foundation, that those two Planets are alwayes lower than the Sun, do fall to the ground: And then, if two of the Planets (*Venus* being the greatest or chiefest Star except the Sun) be carried about the Sun, and they are of so great power in judgements, and so near to us, those spots, or Stars in the Sun, or most near to it, shall likewise be of far greater authority to refell all the Aphorismes of the Antients: And the Stars which have lately been found to be moved about *Jupiter*, shall conjecturally convince of the Rules of *Almegistus*, whether they were written from a foundation. That in the mean time I may be silent touching the opinion of *Copernicus*, which at this day doth not want its followers, and those of no small authority, although they do presse their consent under silence: which opinion notwithstanding, once breaking forth, will ruine all apparitions in the Heaven, and Predictions. Fourthly, the point of nativity

rivity is uncertain: and seeing that the Stars do vary in every point, Every prediction is of necessity uncertain: I being sometimes deceived in my younger years, have attributed very much to the significations of the Stars; but when I could not satisfie my self, that by the remarkable accident of him that is born, I could finde the point of his Nativity; which is plainly necessary, if those accidents do any way proceed from the Stars: at length, in behalf of a great Nobleman, I described or wrote down his accidents, to wit, That in the eleventh year of his age, a Wife of six years was married unto him, he having obtained the degree of Knight of the Garter, having travelled far, even to the nineteenth year, that he had received a wound in a Duel, that his right thigh was broken by chance, in a Coach, the precise houres being adjoyned, with very many observations of things: The Countrey where he was born, being added; on the ninth day of the fourth month called *June*, and the houre, between seven, and ten in the forenoon, of the year 1604. I my self went to the most skilfull Judiciaries, the Question being also sent away into other Countries, with a promise of 600 Crowns to him who could divine or tell the point of his Nativity (to us known) from the aforesaid accidents: At length, none touched at the true point, but he that came nearest, did differ as yet the space of seven points above half an houre from thence. There were in the mean time, Standard-defenders, who denied that such a point was between the seventh and tenth houre, by which such accidents could be signified; but indeed, that point was found to be presently before the fifth houre in the morning; yet in the truth of the matter, he was born at *London*, I being present, seven points after the ninth houre *Solar* or according to the Sun, and not horologiall or according to the Diall or Clock. Afterwards therefore, I with a notable repentance, lamented my aptnesse of belief. Moreover, touching the falseness of the foundation of Predictions, it as yet more clearly appeareth: For indeed, they themselves do confess, that their Eccentricks or things not having one, and the same Center *&c.* to be meer fictions, and almost impossible to save or preserve their speculations: which soundeth, that they are ignorant of the Orbs or Circles of the Heavens, and the carryings of the Stars: And so these absurd fictions being supposed, its no wonder that many near akin to them do follow. I have known a remedy whereby otherwise the young would stick in the birth for the space of a day, and houres, and that drink being taken, the Woman brings forth presently after a quarter of an houre; and so the point of Nativity is deceived; and likewise *Hermes's* Scale of *Empsichosis* or quickning; but this Remedy, I have written else-where, to consist in the Liver, and Gaul of an Eele, being dried and powdered.

Lastly, the falshood doth more appear; for they say, that *Saturn* is a cold, and dry, melancholy Planet, and therefore envious, and stirring up to thefts, and treacheries, plainly evill, because of the nature of the Earth. But that *Mars*, because he is hot and dry, (not the Sun) is evill, cholerick, a Warriour, murderer, and cruel, because of the nature of the Element of fire. But that *Jupiter* and *Venus* are of the nature of Air, merry, sanguine, good, even as the Moon, and *Mercury* being cold and moist, are of the nature of water, and phlegme: And so also therefore of a middle nature. But a moderateness agreeth to the most hot Sun, not a humour, nor an Element. Wherefore, either the Sun shall languish by reason of injury, or the feigned powers of the Elements are badly attributed as causes of the properties of the Stars, whose property it is, not to change, but to give an alterative Blas to these inferior Bodies. Wherein, many falshoods come to hand.

For first of all, they do causatively sink evill within the Heaven.

Secondly, That the qualities of the Earth are evill or naught.

Thirdly, They place the fire among Elementary Bodies.

Fourthly, The Stars also, even the two Elements which God had made, were not to be good.

5. They falsely compare the Stars in their causative property, to Elementary qualities.

6. Therefore they do falsly attribute to the Stars a causall virtue of fortune, wit, &c. with respect to the first qualities.

Wherefore, since there are in the judicall part of Astrologie, so great nakednesses, falsehoods, vanities, and in brief, nothing but conjectures supported by meer lying Rules; it is no wonder, that the cunning Workman doth imingle himself with these thousand, that he may have now again his four hundred Prophets opposite to one *Micah*. Therefore Reader, whosoever thou art, be not (after my example) wise in things on high: but the Heaven, as well in its Scituation, as through the deep blindness of our ignorance, none doubteth to be high. Wherefore surely, I would not search into the secrets of Heaven, who truly have not in the least known earthly ones: But if God do of his own accord reveal them, sing to him prayles with a thankfull heart. I am sure nothing is to be revealed, but what shall have respect

spect unto his own glory, and the usefull fruit or benefit of men. I have written, in the Treatise of the Plague, more things concerning Epidemical or Universal Diseases.

CHAP. XXI.

The Birth or Originall of Forms.

1. The Schooles do abusively teach the birth of forms to be from the Heaven.
2. The belief of the Authour.
3. It is proved.
4. What hath deceived the Schooles.
5. An error about the causing or begetting lights of the Sun.
6. The unconstancy of the Schooles.
7. At length, they had rather that forms should arise out of the power of the matter, but not from the causing light of the Heavens.
8. The opinion of S. Thomas is refuted.
9. The contradiction of the same Thomas.
10. The opinion of Scotus is refuted.
11. The dull opinion of the School of others is refuted.
12. Atheisme beginning.
13. The Schooles do conclude against themselves.
14. Augustine thought excellently well.
15. As oft as the Schooles do stumble, they easily nod with doubting.
16. Seven Positions of the Authour.
17. How much the Creature can give to the producing of forms.
18. What kinde of thing a fruitful seed may be.
19. The progress of the seed to the wished light.
20. The like flowings of Mineralls.
21. A faculty in some sort sensitive, is proved in Mineralls.
22. A heathenish error hath seduced both these Nobles into five absurdities.
23. And likewise they had knowingly learned nine remarkable things.
24. That the fire is neither a substance, nor an accident.
25. The demonstration of the proposition.
26. The proof of the subsumption by handicraft-operation.
27. That Light wanders from subject into subject.
28. What the flame is.
29. The definition is proved by handicraft operation.
30. The fire is a positive artificial death.
31. Some positions teaching the nature of the fire.
32. A conclusion out of the premises, and positions.
33. A Mathematicall demonstration.
34. The Schooles do contradict themselves in answering.
35. Some further proofs.
36. The Schooles intangle themselves.
37. They contradict the holy Scriptures.
38. What the vitall spark is.
39. How the Light of the Sun differs from that of the Moon.
40. The Light of the Sun is plainly changed in the Stars.
41. Why the Moon, although lesse than the other Stars, may be called a great Light.
42. The Moon rules the nights by a night light, even while she accompanies the Sun upon the opposite Horizon.
43. The Moon is not onely a receiving, and reflecting Light.
44. She is proved to have a Light proper to her self.
45. A cold Blas of the Moon is from the property of her own proper Light.
46. Demonstrations upon that Light.
47. The difference of the Beames of the Sun, and Moon.
48. To rule the day and the night, to seperate the Light from the Darknes, and to seperate the Day from the Night, do differ.
49. The Moon by the Light borrowed from the Sun doth not rule the night.
50. How living Creatures that wander by night, do perfectly see under the thickest darknes.
51. They do not send forth a Light out of themselves.
52. What darkneses that may be felt, and what utter darkneses in the superlative Degree are.
53. Why evil Spirits do the more willingly make tumults or noyses in a dark night.
54. A

54. A History of a Night-walker. 55. A wound is hardly cured, if a Moon-Beam hath shone on it. 56. The Light of the Moon cureth excrescences or over-growings of flesh. 57. A whole Frog by a Blas of the Moon, and cold, doth return into a Chrystalline Muscilage. 58. Gluten de aquatico, Or the Glem of the watery thing, is commended. 59. Why the Moon doth respect Plantations. 60. why Plants are digged up, and cropped off before the rising of the Sun. 61. That two great Lights are sufficient. 62. The manner, and Progres of budding or springing. 63. A bright Lightning is at length in the Archeus. 64. From whence the fruitfulness of Mineralls is. 65. Brightness is not the form it self, as neither is the brightness of the Candle the form of the flame. 66. Nature by it self, doth not contain, nor reach to the form. 67. A progress in hot bruit Beasts. 68. A fourfold form of things. 69. That no substance is of right, to be brought to nothing. 70. The Schooles fight against their own Doctrine by a Maxime. 71. The Mystery of the Creation of man. 72. There are more Species of Lights, than of materiall things. 73. How the brightness of seeds differs from a formall Light. 74. The Light of the form differs from fire in its whole generall kinde. 75. The power of framing or creating of forms, belongs to an infinite wisdom and power. 76. in what manner the minde pierceth other forms, according as its own sensitive form. 77. Properties are in-bred by a formall co-touching. 78. God toucheth and pierceth all forms; but is touched of no form but of a good minde. 79. The innocencies of Aristotle are the blasphemies of Christians. 80. That the Soul suffers nothing destructively from frail Bodies. 81. The sensitive Soul in us, is not the specificall one of a bruit Beast. 82. How the sensitive Soul is limited or disposed of by the minde. 83. The Vegetative form in a bruit Beast is not of the Species of Plants. 84. Fire is made hotter than fire. 85. The vegetable Soul is indeed vitall, but it is not properly to be called, living. 86. The offices of one soul are extinguished, those of another being unhurt. 87. The differences of the Archeus. 88. The Solar light is in the Bird, and four-footed Beast; but the Lunar light is in the Fish. 89. The Schooles are ignorant of the degrees of simples, so long as they know not the powers of formall Lights. 90. The fire of Hell doth seperate the Archeall Being. 91. Quercetanus deceived in Ice. 92. The error of Paracellus in the degrees of Simples. 93. The Light of the Sun is not the constituter of a Being. 94. The seeds of Solar, and Lunar things are distinguished by the sight. 95. The two great Lights do answer to the two primary Elements. 96. Light is drawn into a flint out of the lightsome Body of the Sun, and is for some time kept in darknes. 97. The use of breathing assigned by the Antients, is fallacious.

HEathenisme doth yet so remain with us, that we being diligently taught by the Schooles, do even still believe, that the whole governance, and successive change of sublunary things do depend on a certain (that is, an unnamed, unknown, conjectural, and uncertain) motion of the Heavens, on the scituation, light, and aspect of the Stars. Not considering, on the contrary, that the gift of multiplying, or generation was powred forth before the Stars were born; and therefore, that the blessing of generation, and of successive changes following thereupon, would be after a sort frustrate, if the whole government of the inferiour things were from the Heaven; and that also should be true, *That a man and the Sun doth generate a man*: For the first man that was formed was made of the mud or dust, and was endowed with a Soul by the in-breathing of the divine Blast: But I have already sufficiently proved above, that the Heavens are neither to confer manners; nor knowledge, nor fortunes. Now I will prove moreover, that indeed they can neither give Life, nor Form: For truly these opi-
S
nions

visions of the Schooles have in times past so infatuated or befooled them, that it hath stood believed that the immortall minde it self is naturally produced by the seed of man, and the influence of the Stars; and although the Church hath forbidden that thing, yet the Schooles being even till now, seasoned with the errors of the Heathen, do teach, that besides the minde of man, all forms, essences, beginnings of all things, and consequently, that our life, inclinations, perfection of properties, properties, and fortunes, do proceed from the motion, and light of the Stars, and perhaps moreover from their influence.

2 But I believe far otherwise; for I profess, that he who by the onely word of his good pleasure, made the Universe of nothing, is All in All, and at this day also, the way, originall, life, and perfection of all things: So that although second causes are, and do operate as it were partiall causes, directions of motions, and all dispositions necessary to generation; In-
somuch, that therefore, the Almighty will in nothing more, give his honour to any Creature; yet he alwayes remaineth, as the totall cause, continuing the perpetuall parent of things, the framer of nature, and its governour by creating: therefore I profess, that as in the beginning, nothing was made without him; so also, that at this day, the creation of every form is a thing made of nothing, by the very same Creator: which thing I not onely speak in behalf of the matter once formerly created, but also of any kinde of forms: because as the form, is as it were a certain light of the thing, and the top of that light; So none can cause or beget the forms of things, but the Father of Lights, who giveth all things to all, nor is not far off from every created thing: Neither may I believe, that the Heavens do frame naturall forms of nothing, or that they give the seeds, or souls of things, which they in no way have: because Faith, and also Religion do reach me, that God is also at this day, the immediate principle of things, every where present, working all the perfection of all things. And therefore, whatsoever is any where, essentially, that that thing doth owe to God its whole, as much as it is, can do, knoweth, or hath.

3 For Creation hath respect, and sheweth a disposition unto a thing existing in perfection; but the perfection of a thing is the proper internall essentiall form of every thing: therefore its immediate beginning cannot be from any other than Creation: And therefore is immediately from the one onely unutterable Creator of things.

4 The Schooles therefore thinking the contrary, were deceived, when they saw the light by it self, to make fire thorow a Glasse. I say, they thought the light to be an accident; but the fire to be a substance; and in their thoughts of both, they stumbled.

5 And therefore they waxing blinde at the natural light of the Sun, flee together unto it, as it were the Creator of the substance of fire, doubting in retiring, whether the Heaven should as yet frame the form of the fire, or whether there were any other artificial light equivalent in this work? For such a sluggishness of the Schooles doth alwayes remain, that having gotten an example (erroneous and suppositional) they straightway slide to a generality: least by diligently searching through particular kindes or Species, they should be wearied, and finde something which should constrain them to depart from the possession of a supposed knowledge: I say they could not understand, but that they should believe the light of the Sun to be a Creator, and also of all essentiall forms.

6 But they stumble, and fall in the place of exercise, and being unconstant, do run away: For when they thought that one essentiall form of the fire was generated immediately by heat, putrefaction, and rubbing; and now to be taken from another light without respect to the Heaven, and its co-working, they sang a recantation, they fought against the Heavens, and their own former opinion, and will have the Creation of forms to be fetched back from these; the which notwithstanding, they do sometimes freely, and credulously yield unto them, as being uncertain, to what Authour the birth of forms may be due: wherefore, when they saw fire to be taken or drawn from fire, and so that in a combustible object, there was fire potentially;

7 Straightway also, by the same right, that all seeds did contain a potentiall form, and so far indeed, that at length, an actual form is brought and procreated out of a potentiall disposition, which they call the power of the matter; but surely ridiculous: For at first they thought, that the same thing did happen to the generations of all seeds which they had already experienced in the light, and fire: Therefore they afterwards began toughly to maintain, that every substantiall form (but I do grant an essentiall form to any things whatsoever, yet a substantiall one to none but to man, by reason of his immortall minde) or act, was produced without a mean, out of the power of the matter: That is, that it was created by the onely dispositions of the matter, which is to say, by accidents. And as this knowledge of those forms was brought forth from the brain, as it were *Minerva* the Daughter of *Jupiter*: it was also doubtfull, unconstant, without sense as to the subject of its inherency, and soon rent a sunder into divers Sects. And

And indeed first of all, S. Thomas teacheth, that accidents do in truth indeed generate a substance; but that is onely in respect of the substantial form, whose Instruments they are. In the first place, here S. Thomas hath forsaken his Aristotle, and will have the efficient cause to be internal, sliding out of the bosom of the form, and dependent on it, & in this respect the generating efficient cause thereof. 2. He declareth these intricacies: one substantial form, doth not cause another, of it self; but its accidents, do in truth, do that. Likewise, Accidents do not in very deed of themselves, cause substantial forms; but it is the virtue of substantial forms, whose Instruments onely accidents themselves are: or as he elsewhere saith; That accidents are the properties of substantial forms, & whatsoever they do work, that that is done by virtue of the forms: But surely, by the leave of so great a man, it is not in the things of nature even as it is in humane affaires, where the Judge, or Priest doth work by the name or authority of an office, and not as John: For such kinde of respects, nature is ignorant of, and those she hath even hitherto willingly wanted: For every thing in her possession acteth that which it doth act, without the relation of authorizing: To wit, an accident doth act as much, and such as it is in it self; but not as by the commission of that whereof it is the Instrument: because nature is ignorant of under-appointments, and every fallacy of right or authority: For a thing operateth, as much as, and what it can, without a Commission. For what doth it belong to the effect of producing of forms, that accidents do act, in as much as they are the Instruments of the substantial form, or in any other respect, if in the mean time, essential forms are in very deed, and actually constituted by accidents themselves? But surely an Instrument, although it may generate something in Mathematical Science, yet in no true understanding is it a generator in nature, because it is external to the thing generated, and singularly, to its form, nor indeed containing the essential Idea or first shape of the form, much lesse the Archens thereof: For truly, Accidents as they proceed from the generator for the intent of generating, ought to contain a thingliness, and seminall properties requisite to generation: whereof, accidents as they are such, are deprived: Because at the most, they are onely dispositive meanes of the matter to receive a form, but not to procreate it: therefore it seemes, according to D. Thomas, that accidents as they are the Instruments of the form, should be as it were the instrumentall pipes, by which the form of the generator should breath a form into the thing generated, if the matter hereof be first well disposed by other accidents, But then, the immediate generation of the form should not agree, or belong to accidents: as (indeed) accidents, are never (under the understanding of an Instrument) substantial producers. But Scotus insisting on the same delusions drawn from the producing of fire, declareth, that accidents do no manner of way generate substantial forms, but that one substantial form doth in very deed actually produce another out of it self. This saying, at leastwise, taketh from the Heaven, and Sun, the generation of forms.

Secondly, it maketh every seed actually animated, to be endowed with a substantial life, and form, with the doating Thomas Fienus, Physitian at Lovaine.

A third there is, which holds, that accidents by their own proper virtue, and without the concurrence of a substantial form, do immediately produce a substantial form: For this man, (as I have said) being most exceedingly over-blinded by the presence of the fire, and light, like Bats, is constrained to confess, that the solemn command of that great blessing, *increase and multiply*, is given onely to accidents: For others like Africa, do alwayes bring forth new Monsters out of the presumption of humane knowledge; So that although the foregoing opinions were absurd: yet these men do here set up as yet more superlative absurdities: For indeed, if nature doth require (as the Naturalists do suppose) a certain seminal succession, and continuance of one flowing from another, as a principle or beginning, con-substantial, and conjoynd with the thing begun: how therefore could accidents, being any way taken, procreate, or contain a substantial form? they confess that every form is the inward perfection of the thing, the essence, substance, and originall of the accident of its composed Body; yet they will have it to be born, produced, and as it were created of nothing, by accidents, as it were dependances of the essential form its Predecessor: But seeing that all natural things do produce their like in the special kinde: therefore it followes, that they will have the essential form to be of the same Species with accidental forms: yea that accidents have have snatched that Prerogative from substances, that accidents should produce accidents, and moreover the essential forms of substances: But that substantial forms as it were growing dull through rest, should keep holy-day, and had committed the whole weight of their business to accidents their Vicars; that they might falsifye their own proper maxim, and that of Aristotle: That every Agent, is naturally born to produce its like. Seeing accidents should not in producing, be onely accidentall, but also substantial forms, and the which they teach

also to be substances. Therefore the maxim of the Schooles, seemeth to me, to contain a fallhood, and something of Atheisme; That every Agent which disposeth to a form, doth also give that form: because if a substance differs in its predicament from accidents, their principles ought not lesse to differ: For the active, motive, dispositive, and essential principle of generation is the very efficient cause, and the Archeus Faber or Master-workman. Therefore the glorious God, doth at length, create the forms of substances: therefore, whose principles are in the general kinde and predicament, divers, the effects of those things do equally differ, even as the same like causes are like to the like things caused. But it followes from what hath been already said; That heat produceth heat, not fire; and much lesse by far, the form of a Chick: In the next place, not any other thing besides heat, because seeing the efficient cause is internall, and of the essence of the thing caused (which thing I will afterwards prove against *Aristotle*) therefore one and the same thing cannot be constituted by nigh causes different in the particular kinde; And much lesse by things differing in the whole predicament: For neither is a thing granted to be without its essential properties, as neither an Agent without an Instrument, and mean. By what mean therefore, or at length, by what property out of it self, shall heat be an agent in the producing of a form, or any substance? and by what co-touching shall heat touch a form, that it may produce this form in another general object, from the participation of its own Being?

13 For truly, according to the Schooles seasoned with heathenish error, every form of substances is a substance. From whence Christians ought to infer, That the Heaven, as neither accidents dispositive to a form, can frame any substance out of nothing: because the creating of a substance is proper to the Creator alone.

14 Therefore *B. Augustine* rightly thought; if God contains all particular kindes or Species, " (yea and their individuals) in his eternall understanding, how should he not make all things? " would he not be the artificer of some things? of effecting which, his laudable minde should have the art and knowledge unutterably? Therefore, although the seed doth contain the Image of the Begetter, an Archeus proper to it self, with all things requisite to generation; yet unless the essential Being of a form did depend originally, wholly, exemplarily, perfectly, issuingly, and immediately on God, nature could never work any thing to attain a form, because it should plainly want an active power, if it should be deprived of that relative respect: Therefore in the first place, the Heaven, or Stars, in no manner of understanding, by motion, light, influence, concurrence, co-operation, or coupling, do efficiently, and immediately produce the essential forms of things: which indeed are onely alone to us for *signes, seasons, dayes, and years*; and whose offices, none may compell into new services. *Jeremy*: according to the wayes of the Gentiles do ye not learn, and be not afraid of the Signes of Heaven, which the Nations fear. If not of the Signes, much lesse of the Stars, because they have not the reason of causes, but as they are for *seasons, dayes, and years*. Neither can a Christian without wickedness, give them other offices: For there is according to *Gregory*, a power conferred on the Earth, of budding, from it self; even as also I esteem it wickedness, to attribute the power of increasing, and multiplying to living Creatures, as to the Heaven.

15 But the Schooles do easily go back from the Heaven to dispositive accidents. But I on the contrary, state it for a position: That accidents neither by themselves, nor as they are the

16 Instruments of forms, do produce the forms of substances. Neither that they do produce any other form of one substance: Seeing the form of the thing generating is locally without the seed.

2. The Earth also, although it hath received a power of budding, and the seeds of fructifying, without the intervening of the seed of Heaven, or any other cause; yet it is not the productive or effective cause of forms.

3. I suppose therefore, that God is the true, perfect, and actually all the essence of all things.

4. But the essence which things have, belongs to the Being, or the Creature it self: but is not God.

5. For although a Being hath its essence from God dependently, for a Pledge, Gift, League, or Talent: yet it is proper to them by Creation.

6. But it agreeth to a Being, with its essence, that it doth, and operateth something for the propagation of it self, according to the blessing, *increase and multiply*. Hence indeed, it hath the place of a second cause.

7. Therefore God concurrerh to the generation of a Being, as the Universal, Independent, totall, essential, and efficiently efficient cause; but a created Being concurrerh, as the dependent, partial, particular, and dispositively efficient cause. But what the Creature can con-

contribute to the producing of a form : Mark, That since Beings have nothing from themselves for generating, but do possess all things from a borrowing, and freely : they do confess 17
for that very cause, that God worketh all things mediately, and immediately, but that a living Creature doth not generate a living Creature, but the seed well disposed to a living Creature : Therefore, it doth not generate the form thereof : But the seed is as it were the disposing Master-Workman, as to the form of a living Creature ; but not as the maker of the form : indeed it borroweth the Archeus from the thing generating, not the form, yea nor the light of life wherein the form shineth.

Therefore in the beginning of generation, the Archeus is not as yet lightfome ; but it is 18
an Air, into which the form, life, or sensitive soul of the generater hath a little twinkled, untill it had sufficiently imprinted some shadowie Seal of its brightness.

Which Air being greedy of the splendor felt in the generater, once, and shadowily conceived in it self, intends by every way possible for it, to organize the body or fit it with Instruments, for the receiving of that light, and of the actions depending on that light : which way therefore it breathing in desire, enflames it self more and more (this thing in a metaphorical figure, is for nature through a desire of self-love, to pray, seek, and knock) and runs most perfectly that it may receive that light, form, or life, which at length, it obtains not else-where, than from him, who is the way, the truth, and vitall light, or light of life. Whither therefore when the Archeus hath come, nor in the mean time can proceed any further, and is stayed : at length it receives forms from the hand of the Father of Lights, after that it hath fully performed its offices. Christian Philosophy dictates these things thus, which in living Creatures, and Plants is made easie to be understood. : But in Stones, Minerals, and Metalls, and so in fruits of the water that are without life, the same things are suitably to be interpreted : For although this Family doth not propagate by virtue of a seed, neither doth send forth its posterity out of it self, a Being is not therefore wanting in it which may thorowly bring it unto the appointed bounds of maturity : For indeed, since nothing doth any where dispose, or move it self, unless it be a seed ; it must needs be, that whatsoever is generated, that hath a disposer within, who sits in a soft, watery, salt, clayie, &c. Air : Not indeed that it floweth here, or wandereth thorow that masse, even as it doth in brut Beasts, or that therefore it dwelleth in a perpetual juyce ; but the Air is incorporated throughout the whole Body, nor varying from the disposition of the fruit produced : yea in the number or rank of Minerals, that disposer is almost vitall, and sensitive. 20

Because Chymicall Adeptists do with one voyce deliver, that if the seed of the Stone which maketh Gold, being once kept warm in their Egg, be afterwards, in the least cooled or chilled, its conception, and progress to a stone would be afterwards desperate : which thing, seeing it is like to Birds Eggs, it also therefore cannot subsist without a sensitive life. Truly, it is to be wondered at, that the Schooles do acknowledge all second matter to flow from a certain universal matter, yet that they do not admit, immediately to derive every life, or all forms from the primitive life, and first act of all things : To wit, to derive all the perfection of things from the universal, and super-essential essence of perfection : yea rather, that they at this day do deride Plato with his principle of the Gods, and Avicenna, with his *Cholcodea Panto-Morphe* or goddess of *Cholchis* that gives a form to all things : who nevertheless, have far neerer saluted the truth in this thing than Christians, who maintain, that the very lives, substantial forms, and essential thinglines of things are produced by the aspiration or influence of the Heavens, by the endeavour of accidents, and the favour of material dispositions. 21

I set forth the blindness of the most rare men, made under or in a time of light. For they think the fire to be a substance, and the light to be an accident onely : They have consented through the strong belief of credulity, into the errors of the Genriles, and have been seduced into many absurdities. 22

1. They have been constrained, absolutely to deny the forms of things to be lights.
2. That lives, or forms, and lights, are placed among substances : seeing they acknowledged no middle Being between a substance, and an accident.
3. Matter, although it is a substance, to be constantly abiding, and alway remaining ; but forms to be privative substances, yet to be annihilated like accidents.
4. That matter doth borrow its substantial essence from a form not constantly abiding, but to be annihilated or brought to nothing.
5. That forms do yield to the matter in supporting, and subsisting : which absurdities, unless they had been credulous, they had by looking back taken notice of.
7. For they had known, that the minde onely among forms, is a substance.

2. But

2. But all other forms to be of the rank or number of life, without an accident, and substance.

3. That it is impossible for matter ever to be made an accident.

4. Because matter is not to be annihilated.

5. That it is impossible for an accident to be changed into a substance.

6. That an accident taketh to it degrees, but not a substance.

7. And that therefore an accident being on both sides graduated, cannot lay aside its graduality, that it may be made a substance.

8. That although light be accounted an accident, it shall never make fire of it self, unless fire cease to be a substance.

9. That it is a frivolous Question, how an accident doth make a substance, seeing it presuppoeth an impossibility. Therefore an accident shall not produce a substance from it self, seeing this is impossible: neither can an accident make a substance of a substance: For also, the Question doth not presse, how a substance is made of a substance; But how an accident doth produce a substance: For although a dispositive and accidental operation doth interpose in the producing of a substantial thing: yet the producing of a substance it self doth not any way respect an accident, as its productive principle. Moreover, seeing the two chief leaders of the Schooles, waxing blind under the beholding of the light, and fire, have been made to wander from the truth, I have judged it worth my labour, for me to demonstrate to the young beginner of the art of the fire, that the fire is neither a substance, nor an accident; but a Creature peculiar, and seperated from both, which no where hath its like: But that Kitchen fire is not a substance: For indeed none is Elementary; yea if it were, it should be of no use (as I shall shew in its place.) For four Elements cannot concur to the composition of Bodies which are believed to be mixt: Because the substance of Elementary fire doth not descend from so many leagues, that it may joyn it self to its fellow Elements for the constitution of those mixt Bodies, and that hastily and presently, at the pleasure of the feeds. Neither is it the property of fire to descend, as neither is it the property of the water to call to it fire for a mixture for the future to be made. For those co-mixtures of Elements are the Dreams of Heathens, and their ridiculous mockeries, whereby the Schooles have hitherto without controversie, suffered themselves to be circumvented: Because if there were an Elementary fire nigh the Moon; that it might be true fire, it ought plainly to have the same properties, which Kitchen fire hath; or this likewise should not be fire, and the properties of this should not be essentially common to Elementary fire: For the Heavenly, or Elementary fire ought actually to consume, and to have a nourishment, not indeed one more outward about it; but wholly very well mixt within it; seeing one part of the fire, ought to be nourished as well as the other: yea, for unless this should thus happen, the fire that was neighbour to the Air, as to its nourishment, had devoured and consumed that its nourishment, and in the mean time, the fire near the Heaven had before perished without nourishment. Also I have shewen in its place, that it is a ridiculous thing for the Air to be the nourishment of that fire, and that being as yet granted, that all Air had long agoe failed, that fire cannot make an excrement out of Air, nor any thing more pure, simple, before it, or finer. And moreover, if it should make fire of Air, there is not afterwards an Element a Neighbour to fire, which of fire may at length produce another Element: Now of necessity, there had long since been no longer Air, but whatsoever had been of an Aery form had been onely fire: Or if Elementary fire ought not to be nourished, although it hath most exceeding devouring qualities, at leastwise, the Schooles ought to have shewen, why fire is lesse nourished, or doth turn the guest its neighbour into it self, than they suppose the other Elements to do that. And likewise why Kitchen fire, seeing it is true fire, hath this adjoynd necessity of nourishment for its support, or decay, and why the primary Element of fire it self is deprived of the same: For they have not considered that true fire stands in the will of the Artificer, and is forged, slackened, and heightened for his uses: For he stirreth up fire at his pleasure, out of things which it is virtually in; neither also promiscuously out of all things: Otherwise, man shall be a creator of the fire, who is onely the stirrer up thereof. Furthermore, I call accidents all the properties, powers, and qualities of things: But the Beings which have those qualities in themselves, besides their essence, are not accidents; but the originall or entertainment of these: So the heat of the fire, is its property, and accident: neither is fire more heat, than fire is dryness, as neither is dryness heat: And seeing there is a distinct duplicity of these, those two cannot be together in the fire, that they may be the immediate essence hereof. But fire so differeth from both, that it may rightly be denied, that the fire is either heat, or is dryness: Therefore the fire hath also its many properties, and

first

first qualities; To wit, heat, and dryness: And likewise other properties, as there is in it a force of seperating, destroying, burning up, making glass of that which is not glass, of promoting, ripening, &c.

Thirdly, there is light in the fire, as it were a property more intimate, and formall to it. But the first and second of the aforesaid qualities in the fire are meer accidents, distinguished in themselves apart from the fire: to wit, whose subject of inhering the fire it self is; but light doth little differ in essence from fire, although in a formall piercing, and congresse; the light may receive a degree requisite to the Being of fire. Therefore I will shew, that the fire is not a substance, or matter: yet it is the subject of inhering of those accidents, or of its aforesaid properties: therefore the fire is a certain true, and subsisting Being, the which notwithstanding, as it is not a substance, so neither is it an accident, but a creature of a neither sort, appointed by the Lord for the uses of men, and given under the leave or pleasure of the same. Indeed I admire that the Schooles have not hitherto acknowledged, have not looked ino, have not sifted out a thing so plainly to be seen; but that they have believed it to be an Element, and by the onely beholding of the fire, have feigned it to be a fourth Element, and have supported its subsistence with so many absurdities: Neither likewise have they once heeded, that if the greatest heat should be fire, that heat should have the other accidents of fire infolded in it; and therefore the heat of the fire should cease to be a simple thing. Therefore the ignorance of the fire, and that which St. Thomas, and Scotus have subscribed to the invented mockeries of Pagans, hath afforded the cause of the errors set down in the beginning of the Chapter.

Therefore my proposition is; That all substantial forms (the soul of man excepted) likewise the fire, light, place, the Magnall or sheath of the Air, life, &c, are neutrall creatures between a substance and an accident: For concerning the Magnall, I have partly treated in the Chapter of a *Vacuum*: but I thus prove my proposition; because they are actually something, and a Being; they likewise act, and have Instruments, and properties; yet they are not substances, as neither accidents: Therefore [neither] creatures. Which things, for the stating or confirmation of so great a Paradox, are desired more liberally to be explained.

Wherefore the Glasse which sends thorow it all the conceived beames of the light of the Sun, and gathers them together in the Air into the point of a Cone or Crest, teacheth, that this light being united, is true, and actual fire, yet not any thing diverse from the light it self, except onely in its collection. But light is not a substance, according to the Schooles: therefore neither that fire. But moreover, that fire in the Air is not diverse from that which is in the flame: For, for that it hath a combustible matter in the flame, but not in the air, that is to the fire by accident; even as it is to be nourished, and not to be nourished. The major proposition, that it is true fire, is proved; because it acteth all things after the manner of fire, by heating, drying, kindling, burning, melting, &c. and it hath the same meanes, and properties which true fire hath; but no accident doth act by other meanes, or other properties, out of it self: but light being knit together, is an agent by properties, and other meanes out of it self: because it is the property of light, onely to inlighten: therefore light is not an accident. Neither doth that shew it so to be, although the light being collected in the crest, liveth without nourishment: because it is sufficient, that the light of the Sun, or flame doth sustain that light in the crest, without any other corporall food: And so that it liveth, and subsisteth in the crest by the same priviledge of the Sun, or flame. Truly to be nourished, or not, is an accidentary thing, and an effect as to the essence; and so the question of nourishment is impertinent in the question, whether the thing be. Therefore, there is true fire with all its own properties, in the point of the Crest, but a little above, or beneath the Crest, there is likewise light, not any longer burning fire. But since the same thing cannot be in one place a substance, but in another an accident; and now there is fire found, which is nothing else but meer light knit together: Therefore, there is now a creature found, which is not a substance, nor an accident: Seeing there cannot be of one and the same thing, essences diverse in the whole predicament, and that thing in speaking absolutely; and without any respect, is thus true. Therefore, there is meer actual fire found, which is nothing else but meer actual light connexed or knit together. Therefore all fire wholly, is essentially nothing but light. Neither is there room for supposing that light in its connexion is made a compound Body diverse from it self, being not connexed: for we should be thrust thither onely for the difference of fire wanting nourishment, and refusing it. Wherefore in looking more fully into the matter, truly Kirchin fire is by no meanes nourished: For nourishing doth convert the thing which is to be eaten up, into it self, and for it self, that it may convert that which it taketh to it, for its own subsistence, or increase: But that thing happeneth not to the fire, which

acts onely for the necessary ends of its own appointment: which are to sepearate sepearable Heterogeneals, or things of a different kinde that are to be sepearated, to change by the flame, and the which otherwise, if they cannot be inflamed, it onely sepearates. But the Fire hath need of Air, that it be not stifled:

First of all, surely that doth not come to passe that it may be nourished by the Air, or be sustained by the same, or in any wise convert the Air into it self, but onely that it may thrust forth its smoaks into the Air, which the combustible matter hath provided, by inflaming: But Fire is no where found, which ever appropriated any thing of a combustible body to it self, which was nourished, or increased thereby, which thing notwithstanding, the Schooles have even hitherto without any controversie supposed: To wit, that the fire is necessarily fed, not onely with Woods and Coals, but also with Air; and so that it is alwayes of necessity, to be nourished with a double food: Because it shall beneath appear that the beams in a connexed Crest, do as yet keep their own property, and essence, not thoroughly mixed.

In the next place, if connexion should change the essence of Light, truly it going from the Crest, should not be like to it self while it tended to the Crest. And therefore, here is to be noted, that light is immediately in a place, but not in the Air, or a Mean.

27 Lastly, the Beams do not onely proceed in a straight line, from the light to the object; but also they are sidewayes, and crookedly collected, and go together, and do passe from subject into subject, whether thou shalt suppose a place, or the Air. Therefore *by their fruits and works ye shall know them*: that is, the works of the fire do prove the fire to be true: But thole are, heat, drying up, raising up of vapours or exhalations, burning up, melting, kindling or enflaming, or producing of another fire from it self, a generating of its like, together with enlightning.

28 The flame indeed is the kindled, and enlightned smoak of a fat exhalation: be it so; but as the flame is such, and true fire, it is not another matter, being kindled, and not yet kindled, neither doth it differ from it self; but that light being unixed in its Center, hath come upon a fat exhalation; which is the same as to be enflamed.

29 Let two Candles be placed which have first burned a while, one indeed being lower than the other by a span; but let the upper be of a little crooked Scituation: then let the flame of the lower Candle be blown out; whose smoak, as soon as it shall touch the flame of the upper Candle, behold the ascending smoak is enlightned, is burnt up into a smoakie or footy Gas, and the flame descendeth by the smoak, even into the smoaking Candle. Surely there is there, a producing of a new Being, to wit, of fire, of a flame, or of a connexed light; Yet there is not a procreation of some new matter or substance.

30 For the fire is a positive artificial death, but not a privative one, being more than an accident, and lesse than a substance. Which thing since the Schooles are as yet ignorant of, we must more largely declare, as well because it is a Paradox, and hath respect unto the knowledge of forms, as that because from the ignorance thereof, most grievous errors have crept into Medicinall affaires.

31 Wherefore, that I may perfectly teach the divers inclining nature of the fire, I will suppose some positions.

1. That the fire in an inflamed Body, is so united to the inflamable matter, that it is like an essential form to it; when as notwithstanding, it is the destroyer of the same.

2. That the inflamed matter is converted into a smoakie Gas, which is not yet water, because although the fire hath consumed the seminall forces of the thing; yet some first fermentall marks of the concrete Body do remain; which at length being consumed and slain, that Gas returns into the Element of water.

3. That every essential form is as for the essence of the thing in which it by it self is: And that the fire doth destroy even the fat smoak, or Coal, the which it inflameth, and converts into a wild Gas (of which in its place.)

4. That every essential form is so united to its own matter, that it being once sepearated from thence, by extinguishing, or withdrawing, it returns no more to the same habit, or formall act.

5. That every form coming upon a matter, is impatient of another totall form: But a Metall, or any other fixed Body, being fired, the presence of the bright burning fire being withdrawn, returns alwayes into its former state.

6. That every form of a substance hath a specificall matter wherein it is: but the fire hath Wood, Wax, Pitch, and as many subjects as there are particular fireable kinds.

7. That every substantial form doth at length rise up in the matter disposed by a foregoing seed: but the fire wants a seed, yea if there are any, it consumeth or wasteth them away.

8. That

8. That the forms of substances, have not degrees ; but the fire doth admit of a degree by the bellows.

From which particulars I conclude, that fire is not a substance, nor the essential form of substances ; but a positive death of things, and their destroyer, a singular creature second to no other : from whence I proceed thus to demonstrate it.

There is no doubt, but that a Coal is far more porie than Iron, and that it hath lesse of soundness ; but yet, Iron being fired doth more burn than a Coal : Therefore of necessity, Iron contains more of the fire, in matter, and form ; but the consequence is false ; Therefore fire is not a substantial composed Body, consisting of the matter, and form of fire : because otherwise, if there were any substance proper to the fire, it should not pierce the dimensions of the body of the Iron.

The Schooles answer to this against themselves, to wit, that the matter is more compact in Iron, than it is in a Coal ; and therefore it burns the more powerfully, as the Iron is capable of the more fire : For that thing I assumed, to wit, that I might draw this Argument from thence : If fire were a substance, consisting of a fiery matter and form, after the manner of any other substance ; the Iron should of necessity be capable of lesse fire than the Coal, for that it is weightier than a Coal, and hath lesse, and fewer pores wherein the fire may be entertained : But if therefore the Iron be capable of lesse matter, it ought to burn lesse : But the consequence is false, therefore also the antecedent : Because two matters, or Bodies, as neither the essential, totall, or ultimate forms of these, cannot suffer each other at once in the same place and subject. Wherefore Iron, and fire (if this were a substance) could not lodge together in the same subject. But if the Schooles endeavour to evade, and say, that Iron indeed, becomes on a fire, yet that it is never changed into fire : I answer, whatsoever obtains every property of fire, is fire : or fire hath not proper, but common passions with another Being of another particular kinde : But the properties of fire, are to kindle, burn, sepeare Heterogeneous things, to melt Lead, Copper, Wax, to burn in a combustible matter, and to consume : But all these things, Iron fired doth more powerfully perform than a Coal ; therefore in fired Iron there is fire, and so much the more of fire, by how much it doth more burn than a Coal. Again, if Iron fired, hath not in it true fire, but the properties of fire without fire ; those therefore shall be brought in, and left in the Iron by the fire : From whence it followes, that the formal properties of the fire have left the proper form of fire in which they were (suppose in the Coals, or flame) and have wandred into the substance of the Iron diverse from them : For truly, they will not have it called fire, but as the inflamable body is kindled. Add to these things, that if fire be a material substance, the substance of glasse (which the detaining of the most subtile Chymical Spirits teacheth to have no pores) and the substance of fire, should pierce each other at the pleasure of the *Artificer* ; which things the Schooles themselves do utterly deny. But besides the aforesaid absurdities, another doth accompany ; to wit, that heat in the fire doth onely make hot, but its dryness dryeth up, and nothing else : So also, the kindling, enlightning power doth kindle and enlighten, the sepearing power sepeares, the destructive doth destroy, &c. All which properties should not onely be generated by the form of the fire, in the strange matter of Iron ; but should also there subsist without the proper subject of their inherence. Wherefore the fire that is in-fired, is true fire not a substance, as neither an accident ; but a neutral Creature, having in it self divers properties, after the manner of substantial Beings. If the Schooles, I say, had known this thing, they had known that light doth generate light and fire, not indeed as differing in the particular kinde ; but onely in uniting, dispersing, and so to be different onely in degree : Neither therefore that an accident doth produce a substance in any respect. Indeed they think that a far smoak is the matter of fire, but the flame to be the form of fire, and by that thought, they feign it to be a composed Body after the manner of other things : But as many absurdities as I have before repeated do hinder it : therefore the Iron remaining Iron, doth receive into it self true fire, together with its form. So the Air remaining Air, receives fire in the Crest of the uniting Beams, with its forms, and all its properties : But Iron retaining the ancient form of Iron, cannot at once be informed by the form of the fire, if the form of the fire were any way substantial ; that is, unless the form of fire can leave its matter, that it may be onely the assisting form of the Iron, but not the informing : For neither can Air, remaining Air, be at once also another Body, as one Body cannot be two, really distinct. But I pray you, if Iron be not throughout its whole Body fireable, but a Coal altogether fireable ; what should move the fire, that having left its own matter, it should wander into the Body of Iron which is incapable of fire ? Therefore surely, the Iron is fired, and it is capable of fire throughout its whole Body ; and so, as it hath thicker parts than a Coal, so

it self is capable of more *fire*: therefore it is manifest that *fire* is not a matter. Lastly, it is not the property of Elements presently to devour and consume other things (as I have elsewhere largely taught:) But *fire* plotteth the destruction of the thing wherein it is: therefore it is not an Element, nor a matter, or a substance; but a destructive Creature, and a death serving for crafts, and given for the great uses of mortall men. None ever reckoned light among substances; therefore neither light connexed: For truly to be knit together, or not, is an accidentary thing; which substantial thing is not generated (as they think) by an accidentary Being.

- 36 It should also be the simplicity of the Schooles admitting (although falsly) simple light to be an accident, but connexed light to be a substance; seeing connexion sheweth onely degree, which is a stranger to substances: Especially, because the beames that are knit together in the Crest of light, being further carried forward into the figure of X, do return to their own simplicity, and dispersing: yea the beames of the light, are indeed connexed in the Crest; yet they are not wholly united, nor do they pierce each other; but they every one keep their own essence without being thorowly mixt. Fashion a plain circular Glasse, one half whereof, let it be coloured; but the other clear, like Chrystall not infected. Let the clear part of the Glasse be from *A*, into *C*, and from *C*, into *B*, let the Glasse be couloured. I say therefore, that the beames from *A* into *C*, shall be clear and lightsom; but from *C* into *B*, they shall be lightsom couloured. And all of them shall co-unite in the Crest *F*, and they shall be again seperated: to wit, from *E* into *G*, they shall be coloured, and from *G* into *D* they shall be lightsom, being void of colour. If therefore, the connexion of the

- beames in the Crest *F*, (where the fire was) be not a uniting; but onely accidentary, as it were a pressing together into a bundle: Then that light of the Sun is in it self meerly fiery; but differing from fire in its connexion onely, or in the compleat degree of that Creatre. In the next place, the Schooles have stumbled in the fire:
- 37 For truly they believed by faith, that on the first day the Light was created, and nothing else; yet that Creation is not of accidents; which indeed are not of the proper name of a Creature; but of Creazures. Again, in the beginning, the Almighty created the Elements; but the Light was not created with them: therefore neither for an Element. If therefore, the Creation of the Light was not the Creation of an accident, nor of an Element, nor of a Body, much lesse of a concrete, or composed Body. Therefore the Light was not directed by God the Workman, that it may be a substance, or an accident: For the Light is created on the first day, a vitall Principle (but it was not a matter) as a motive beginning: yet with that property, that as oft as by its connexion it should rise into a degree, it should become burning fire: And therefore the fire was created together with the Light: But the fire is not a certain accident, because it hath in it, other accidents, differing in the particular kinde (for that resists other accidents.) It is not also, an accident of an accident, seeing that an accident flowes immediately from a substantial form, ordinarily, but many and divers accidents are not from the form of one accident, as the tributes of a former accident: To wit, one accident cannot be the subject of inhering to other, and divers accidents.
- 38 But moreover, the fire consisting in a slack degree of Light, is for the most part the Companion of life. But Light being united, burns up things that have life. It is the *Vulcan* or *Smith* of Arts, dedicated to humane necessities: For it hasteneth ripenesses, it promoteth the seeds to their ends; it also hasteneth the seperations of things, the closure or end whereof, shorness of life could not else expect without grievous discommodity. For in this respect, it openeth, it teacheth to dissolve secrets, or things hidden, to hasten the operations of nature, otherwise oft-times, slow, drowsie, and buried. Next, it seperateth and expelleth superfluities, it by the vertue of an adjoynd Ferment, removeth the middle life of things, whence are, chearfulnesses, and increaseth of strength: It also seperateth the pure from the impure, the pretious from the vile, the hurtfull from the profitable, and the crude or raw, from the mature or ripe, yea, it ripeneth crudities themselves. And then, the fire prepareth the Instruments of Arts, which our life stands in need of. Therefore let the Father of Lights,
- the

the Creator of the Light be highly exalted throughout Ages, who hath placed a Tabernacle in the Sun, that he might comfort or supply all necessities by the Light of his Sun. Now I will conclude from what hath been said before.

1. That *fire*, and hot light, do not differ but by accident; to wit, in connexion and degree.

2. That the beames of Light do pierce each other.

3. That in piercing, they notwithstanding do keep their essence and properties, not thoroughly mixt.

4. That Light is primarily in place; therefore also fire.

5. That Light and Fire do pierce their Mean.

6. That a thick, dark Body, seeing it cannot be pierced by the Light, is first affected by Light in its Superficies, and then this heats the succeeding parts even to its opposite Superficies.

7. That heat is heightened in an object by degrees, and that in every degree it hath singular operations.

8. That whatsoever the fire affecteth, it is by reason of the place which the thing placed doth occupie; and so, by accident; seeing the chief intention of the *fire* is to heat by enlightning.

9. That the *fire* being at length the Conquerour, overcomes the difficulties cast in between it, by the thick dark Body.

10. That *fire*, seeing that it acts immediately, and primarily acts into a place, it burns all things indifferently, without respect to Bodies cast in between, as it were removing the impediments.

11. That a thick, dark Body being fixed, and resisting kindling, is at length enlightened by the *fire*.

12. That the *fire* or connexed Light finding a combustible matter, doth remain concentrated or centred together in its degree of connexing, neither are the beames of Light separated; because it continually increaseth new *fire* which proceedeth in consuming; but the old *fire* continually perisheth so long as the ascending doth continue.

At the end whereof, the whole light perisheth, since it hath not light from whence it may be enlightened. 39

Whatsoever therefore, hath been hitherto spoken of unired Light, I understand it onely of the Light of the Sun: For truly the Light of the Moon being sent thorow a Glasse, is so far from having *fire* in the Crest, that it is also felt to be colder than the rest which environeth or goes about in the Crest: Therefore, I call for touching to be the judge. 40

And that which is more wonderful than that, that the Splendor of the Sun which is hot, being reflexed in the Glasse of the Moon, doth actually wax cold: For the Almighty hath created two great Lights: And although most of the Stars are bigger than the Moon, yet they are not reckoned great, because all their activities are comprehended under the two Lights: therefore he created those, 41

First, That they might sepearate the day from the night.

Secondly, That they may shine upon the Earth.

Thirdly, That they might rule the day and night.

Fourthly, That the greater might rule the day, and the lesser the night. 42

Yet we learn from the Speculations of the Planets, that the Moon shines as many houres upon the Horizon by day, as she doth by night: Yet the Almighty hath appointed the Moon, to shine, and onely to govern the night: And seeing the Creator cannot erre, it must needs be, that the whole Light, and governance of every night doth depend on the Moon as much as the day depends on the Sun.

Therefore, the Moon was created to shine as well in the Heaven, as upon the Earth, the full of all nights. Therefore the Moon is not like a receiving Glasse, reflecting on the light of the Sun, and void of her own proper light. 44

For although our eye findes no proper Light in the Moon, be it little: For we must give more credit to the Scripture, than to our eyes, according to that saying; *The Sun shall be darkened, and the Moon shall not give her own Light.* From another place this truth shall by and by appear. First of all, it is manifest by the aforesaid Handicraft-operation of the Glasse, that the Light of the Sun being united, is made meer Fire, with every thing requisite thereunto. And then, that the same Light of the Sun falling upon the Icy Glasse of the Moon, doth loose the property of his own heat, and is made a cold light: Which comes not to passe, if it shall fall upon Ice, Glasse, Water, a white Wall, &c. Therefore the Moon hath powers 45

Or faculties; whereby she altereth the Sun-beames: And that cold Blas, ought to be of the Nature of her own light, if between the Agent and Patient a co-resemblance ought to interpose: For truly, another cold object re-percussing or smiting back the Sun-beames, cannot therefore change these into cold beames. Truly neither heat, cold, rough, bristle, sweet, or bitter, do act on the Light; but onely visible, and dark objects: therefore the Moon hath a lightsome force or power of her self, which as it is such, doth act upon the hot light, and changeth it into a contrary property. What if the Astrologer doth foretell the future Colours of Eclipses, do not those Colours promise some certain light proper to the Moon? For truly, they are not conjectured of from a Mean or vapours: because colour cannot be foretold from the quantity of vapours, in the calculation of a future Eclipse. Therefore let the Colours of the Moon failing of light, be the tokens of a light proper unto her.

47 And in this the beames of both Lights do differ, That the Sun strikes his light by beames in a right line; but the Moon doth never respect the Center of the World, or the Earth in a right line; but her center is alwayes excentricall: For she respects the Center of the World onely by accident; that is, when she is con-centricall with the World: And therefore as oft as she is con-centricall in full Moon, and new Moon, there is an Eclipse. Therefore the *Dragons* Head and Tail, are night-points, wherein onely the Sun is directly opposed to the Moon in an excentricall Diameter. Therefore the Moon-beames, do not strike the Earth in a right line; but they are disperfed into an excentricall space, and so she, by way of influence, or by the action of government (of which in its place) displays her forces on the night, or on *Nadir* the point underneath the Horizon right opposite to our feet, whether she accompany the Sun, or indeed be estranged from this Sun by a full Diameter: For such is the appointment of the Moon, which the exundations or Spring-Tides of the Sea do confirm, which are wont to be no lesse under the Moon laying hidden, than at the full of the same. Therefore one end of the Lights is to rule the day and night: next, another end is to sepearate the light from the darkness; and another end to sepearate the day from the night. Neither is that repetition to be imputed to a Solecisme or incongruity: For truly, the Sun shining, or the Moon restoring her Light received from the Sun, the Light indeed is sufficiently sepearated from the darkness; but the Light of the Sun never rules the night, as neither doth he shine in the night: therefore, that the Moon likewise may satisfie her appointment, she can never rule the night by a borrowed Light of the Sun.

48 Which thing sufficiently appeareth, at leastwise, while she runs with the Sun by day, according as by night. Therefore if then also, the Moon ought to satisfie the divine intention, she must needs have also by all meanes, another light, whereby she may shine all nights, and may rule the night, and a far other manner of powring forth her light, than that wherein she reflecteth the Light of the Sun. Indeed the Moon sends forth her proper displayed Light, beyond, no lesse than beneath the Hemisphere of the Air, Water and Earth: which way, the supposition of the Center of the Universe maketh or tenderth, according to the Opinion of *Tycho*: Yet so, that the action of government of light, and influence operates more powerfully in the night, from whence the Sun is absent: the which, that he may sepearate the day from the night, ought to sepearate the properties of the Moon from his own, although the Moon be conjoynd with him. Diseases belonging to the Moon do prove that thing, which are exasperated a little before night, also at the new of the Moon: And so she worketh thorough the bones, and Marrowes of those who are shut up in their Bed-chamber: which thing, is not so proper or natural to the Sun. Therefore the Moon doth sometimes make a stronger influence on that part of the Sphere that is opposite unto her, than on the part where she is placed. This light being unknown to the Antients, hath been called an influence: But I had rather reserve the sense of the Scripture; because it is said, *The Moon was created to give light by night* (that is, all nights indifferently) even so as the Sun gives light by day. Therefore that which they have called an influence, is the property of the Moones light, and that is not to have named a thing from the effect, but from the causes.

49 The *Bat*, *Dormouse*, *Moufe*, *Owl*, and whatsoever Creatures do distinguish their objects a-far off in the night, under the thickest darkness, and do note the swiftest motions of objects, which our eyes can scarce observe at noon-day; some of whom, although they may bear before them a Grayish, or Skie-coloured brightness; yet they never enlighten the mean by that brightness, that they may see perfectly through it at a far distance: Therefore there must needs be some continual light in the thickest night, and shut up Den, for which lights sake such living Creatures do perfectly see: But if it be unperceived by us, and yet doth in truth exist, it is no wonder if the light proper to the Moon hath deceived our eyes.

50 But that it may be plainly made known, that night-wandering Animalls do send no light out of their

their eyes, which may be for the enlightning of a medium or mean, to know distinctly an object placed afar off; and so that those Creatures do see onely for the light of the Moones sake. Let a Looking-glasse be placed between the Eye of a living Creature, and its object; and that under the thickest darkness; and surely thou shalt not finde the least reflexion of light in the Glasle: yet if thou shalt put a small Candle at the utmost end of a large Hall, but if in the other furthest end of the Hall there be a hole, thorow which that feeble light may passe into another dark Hall or room, in whose end let a Looking-glasse be; truly that weak light being shaken by the direct beame of the flame of the Candle, is received, and will appear in the Glasle; yet it is not sufficient for a man to discern any object. Therefore much lesse shall the brightness or shining of the Eyes, a beam whereof doth not fall, and appear in a nigh Glasle, be fit to enlighten the mean, that they may perfectly discern all things.

For there is under the Earth a light even at midnight, whereby many eyes do see; being witnessed in the holy Scriptures, and bewrayed by those kinde of brut Creatures, which owes not its rise but to the Moon: For therefore there was darkness that might be felt: which should far exceed ours, although thick, because it was deprived of all help of the Moon: Nor is it a wonder that darkness hath its degrees, seeing the infernall pit hath its utter, or uttermost darkness (because an *Hebraisme* wants the superlative degree) without the favour of the Moon. For happily, abstracted spirits have something which for seeing, may answer to our eyes, that it may not see wholly throughout the whole, of what belongs to it self; and some of these Spirits are Seers by night, but others being mute or silent like to *Bats*, may as it were wax dim or dark under the Sun or in the day time; and therefore they do the more willingly appear to their own in the dark, and mid night: therefore I will subscribe a History of this.

I had in my time of being at the University, a Chamber-fellow born of honest Citizens. This man, his eyes being shut, did for the most part rise, and wander in the night; but he carried away the Key with him, and returning, opened the Lock that he had shut after him. In the Evening therefore, I arise, and secretly hide the Key under the Bolster; but he arising in his sleep, takes the hidden Key, as if he had seen it, and goes his way. I taking my Coat, followes him: But he climbed an ancient Wall, the bound of the Colledge, beset with Mosse, and Hay: For there was an Arch, whereby, on the other side of the River, the Wall did support the Wall of a Neighbouring Garden. It was full Moon, and a frosty night. I was amazed at the sight, and by reason of the cold returned. But my Chamber-fellow by and by returning, he so quickly or cleverly, hid the Key in a hole of the Cloyster, that any one seeing, could scarce do that thing so undelayingly at noon day: But in the morning, he was unmindefull of all that he had done. For those walkers, their eyes being shut, do see clearly under the thick darkness, they climbe securely, without giddiness of the head, because they do enjoy a Moon light.

A small wound becomes oft-times hard to be cured, because it is inflicted on a member by the Moon, appearing or advancing. Under the Equinoctial line all things do soon putrefie: not indeed by reason of excess of heat (which is now and then greater, and more constant elsewhere; for truly, under the line it sometimes raineth for dayes together) but surely, by reason of the continual nearness of the Moon, and the long and round figure of the Globe, as I shall prove in its place. If a dead man, or a brut Beast, shall passe (one night at least) all the night under the Moon (for there she smites the near places with a full beam) on the morrow morning the dead Carcase flowes abroad or abounds with corruption.

By occasion whereof, it is related among experiments, that if any one (the light of the Moon being collected into a Cone or Crest) doth cast her beames through a Glasle, upon Warts, Apostemes that have a humour like hony, small tumours called Nats, and the like excrescences, untill they shall feel the cold within, they do easily vanish afterwards of their own accord. Nor is it a wonder; for such defects do hearken to the Moon increasing: Hence also in her decrease they shall the more easily perish. Indeed I know, if the Moon shall shine upon a wound, that its lips do straightway wax black and blew, or envious, and resist healing.

In the next place, if a Frog be at the full of the Moon, in a most sharp North winde of winter, digged up, washed clean, and tied to a staffe in a field, the morrow morning a certain white, and transparent muscilage is found, resembling Gum Dragon dissolved, and the shape of a Frog. For that is not the Workmanship of cold (which by it self onely cooles, and occasionally freezeth) else the full of the Moon should not be required: wherefore I impute it to be a passage into its first matter.

Moreover, that first matter of a Frog doth very much prevail in the healing of a Cancer, life.

58 and is called by *Paracelsus*, under a riddle, *Gluten de aquatico* or the glew of the watery thing or Creature; Therefore the Sun doth call forth the flowing of seeds, unto the bound of the last life. But the Moon on the contrary, drawes to the first matter of a thing. For seeing the
59 Moon doth draw waters, and far or nourishable things into the juyce *Leffas*, therefore a profitable observation of planting, and dunging is referred to the Moon. Also that Plants do profit no lesse by night than by day, the family of *Muskromes* and *Pompions* doth shew.

60 Neither is the gathering of Plants before Sun-rising, superstitious: not indeed because nature like unto *Serpents* or creeping things, ceaseth from its works by night; but because they being the more plentifully nourished by the night, have obtained a full nourishment. Therefore the Moon is chief over the night, darkness, rest, death, and the waters; As all things do return to death, rest and water: And for that cause doth the Moon bring in a passage to transmutation. Indeed she doth primarily behold, and move or affect rather the seminall powers than the matter of the same: yea truly, because the light of the Moon drawes back seminall things especially, to their first life, or matter: therefore some *Adeptists* do begin the labour of wisdom with the light of the Moon, according to that saying; *Night unto night stewart knowledge to those that seek it.* Therefore two great Lights are sufficient for all motions, and progresse of seeds, from the first into the last life, and from this into that: For because they do abundantly suffice to the fruitful use of nature; hence they do enroule the other Stars among their Bands: And therefore the Scripture hath made mention onely of the two greater Lights. Thus far of Fire, and Light. I being now about to speak of the birth of Forms, will rehearse that the Masse of seeds do receive into them a corporall Air, the *Vulcan*, which I name the *Archeus* or *Master-Workman*.

61 Some seeds of Woods, or Kernels, or Oil, do contain him in them, as Almonds, Pine-kernels, Pistack-nuts, and the seeds of many Pot-herbs: or they are mealy seeds, as Acorns, Chestnuts, and Corny or grainy seeds: or they do powre forth a milky fruitful musilage or slimy juyce: For the *Archeus* inhabits them, being drowsie, and sleeping in the curd of the seeds, being content with his condition as long as he is negligent of propagation: But when his seed is once committed to the Earth, he cannot but drink in his liquor, and become swollen, and then contract a Scituation, and presently snatch to him a Ferment putrified by continuance: Which Odour, and Savour, although it be putrified by continuance, yet in every seed it is specificall, and therefore altereth by its obtained Ferment, the proper savour of the seed, and consequently, is disposed thereby into a transmutation of it self: For through the putrefaction by continuance, that native or seedy moysture as soon as may be thinks of its resolving, whence is a certain vapour, and afterwards an exhalation: A Gas (which indeed doth easily ascend out of putrifying things) is stirred up, and there ariseth out of them a heat at the time of that putrifying, of what sort soever it be, such as plainly comes to passe in Woods rotting by laying under the ground; and the which, do straightway thrust forth a spongy smok: because that smokiness, the signifier of the heat, and dissolved Body, doth threaten a seperation of things of a different kinde, and so that vitall Air, although but even now more deeply shut up, threatens a breaking forth out of its seminall Liquors, yet its reins being loosed, it wanders first within: So new, and moyst Hay hath made the un-looked for firings of houses: truly not tokens of a slack heat, but of heat rising to a degree. Therefore the Air having once gotten a moderate heat, it by degrees meditates of the perfection of an *Archeus*, doth aspire it, and provoketh the lump of the Body placed under its charge, to the achievable dispositions of Forms. But what hath been already said concerning Vegetables, that doth more plainly appear in the Eggs of Fishes, flying Birds, and creeping things, and most manifestly of all, it shines forth in the seeds of four-footed Beasts.

62 At length therefore, the thin, shining, and twinckling or bright light doth kindle the aforesaid Air of the *Archeus*, so as thereby he may be made vitall.

63 Furthermore, as Mineralls are not diminished, nor made great by the substituting of offsprings, and their manifold propagation: yet because they do contain in them their Beginnings from whence they have increased, and are: therefore, although they are not blessed with a fruitfulness of Issue, yet they have in their own Monarchy the constitutive, radicall, and seminall beginnings of themselves within. I have already said, that this Air is awakened in the seeds of things by a fit matter; and then, that by the young birth of an inward heat, by reason of a received putrifying through continuance, it doth conceive a heat, and at length a brightness, as in Fishes; or a shining, as in things actually hot: not indeed that that splendor is the soul or form of a Plant, brut Beast, &c. (For otherwise there should be of every Plant the same Form in the Species, or particular kinde) notwithstanding, there is in the splendor
it

it self, another specifical thinglines conceiving with young by a specifical Odour, nor far different from the Splendor which limits the light it self unto [this something,] or particular essential thing: So indeed, that although that splendor be stirred up by the force of nature alone (as putrified Woods, things salted, and the Sea it self do teach) yet it is never made vitall but by the Creator, the specifical form of a certain light being added to it, the effects of a thinglines or essence:

To wit, which alone draweth the Odour, Splendor, and all the properties of the enlightened Air at once into the unity of it self. Indeed this is the life, or form of a thing, for want of whose supply, the young degenerateth into a hard piece of flesh in the womb, a monster, or corruption. And although the vitall Air, and its Splendor be present, and do increase; yet because the formall and vitall light faileth, which draweth the subaltern or cursary succeeding properties, and diversities under unity, the young is corrupted, and straightway putrifieth. Wherefore the Father of Lights alone doth immediately frame or create the Lights of Forms, and the Forms of Lights: who giveth life and all things to all, nor is not far off from every one of us.

Moreover, the progress of generation in hot seeds, is of a more easie conception: For the seeds do presently putrifie by reason of heat, afterwards the *Archem* of those doth easily borrow a Splendor, as the betroathed Air of a greater light: For being not yet contented with the obtained vegetative faculty of his own kinde, he breatheth further, and proceeds to the light co-promised to his seed, and stayeth, and is quiet in the sensitive soul, as not being able to climbe beyond it.

But even as in the Systeme or constitution of things, there are onely four degrees; So also there is a fourfold Form of them: one of them indeed is of those which do promise scarce any manifestation of life, as the Heaven, the Stone, Metall, Fire-stone, Salt, Sulphur, Liquors, Earths; likewise barren Vegetables, dry bones, &c. whose form is a certain material light, a form containing, and giving a Being to the thing, and therefore it is also deservedly called essential. But the other rank of things, seemeth to contain a vitall beginning, and character of a Soul by the vigour of nourishment and increasing: As are Plants, whose form varying from the fore-going form, are graced with the Title of life: therefore is it to be called the vitall Form: Not indeed that such a Form is a living Soul; but vitall onely, as it beares the entrances or flourishings of a sensitive and living Soul. At length, the third Order of things, obtains a living Form, not by Similitude, but truly motive and sensitive: And therefore it is likewise called a substantial Form; not indeed by an absolute name, a substance: but substantial onely, as if it should carry it self after the manner of a certain abstracted spiritual substance. And lastly, the fourth is truly, and one onely substance among them all: So it ought to be called a formall substance, never to perish through the infiniteness of its continuance. But I have demonstrated, the light and fire to be a neutral Creature between a substance and an accident. The same thing in this place, comes to be understood concerning every natural Form, to wit, the essential, and substantial, as they are of the race of Light. But that the Angel, and minde of man are formall substances, and truly spiritual; their abstracted manner of existing doth prove: which is denied to other forms, who do subsist, and perish after the manner of every light.

Whence I collect it into a new position for the Schooles. That no substance is to be annihilated by the force of nature, or art. It hath alwayes seemed an absurd thing to me, that a matter imperfect in it self, barren, and impure, should after its Creation, be thenceforth eternal, and that forms that are to be annihilated by death should be true substances: that substances, I say, should be so much more lively than matter, and yet momentary. Wherefore it now appeareth, that the consideration of the fire by the discourse of nature, doth unlock the gate of nature, and enlighten all Philosophy, and hath excluded all despisers of the Art of the fire. I considered in times past with trouble: If the form of a thing be most chiefly, and principally a substance, and so an act whereby the matter is [this something] or particular subsisting thing: truly the form ought most principally to subsist, and endure, or that maxime is false;

That by which every thing is such, that thing it self is more such. But the consequence, together with the maxim is false: For all the souls of Beasts, and all their forms are frail or mortall; for therefore I reckoned with my self, the antecedent also to be false. Indeed all created things were made of nothing, and so they keep the disposition of that principle, and therefore the Forms and Being of things, do in the first place return of their own accord into

into their former nothing. Notwithstanding, God created not man immediately of nothing, but of the mud or dust of the Earth; and therefore his Creation was far otherwise, than that of other things: For the Almighty took dust from the Earth, not indeed that which was equall in weight to a man, like an Image-maker (for of one onely Rib, he formed the whole Body of the Woman) that he might manifest the Myſtery of this irregular Creation not to be after the manner of other things; but ſubſtantial as to the Form:

70 I ſay, the whole Myſtery directed to its ends, or to the Soul, manifeſting that the Soul of man was not onely an out-law, and one onely ſubſtance among other Forms; but alſo, that from the unequalneſs of mud, or the Rib, to a whole Perſon, we might ſee that our Soul is a formall ſubſtance, not of quantity, but meerly ſpiritual: And that which being at ſometime abſtracted by way of a truly ſub-ſtanding or remaining Being, ſhould afterwards (by the gift of Creation) endure for ever. Therefore every Form is created by the Father of Lights, into a proper particular kinde, and is a certain Light of its own Body.

71 But Forms are diſtinguiſhed among themſelves, not onely by the degree of Light, but in the whole Species: And therefore there are as many Species of lights in nature, as there are of things. And ſeeing that alſo Angels are numbered among things; it followes, that there are far more Species of lights, than of material things. But we muſt deſervedly call to minde, that there is a brightneſs or Splendor in the *Archens* of Seeds, and ſo ſomething like to a formall light, which brings the matter to the ſuitable bounds of its particular kinde: yet that that Splendor doth far differ from a formall light; for truly that is forthwith, and immediately created by the Father of Lights; but the Splendor proceedeth out of the lap of nature.

72 And the largeneſs of the difference and unlikenes, is placed in this, that amongſt it or at the moſt, the Splendor of the ſeeds, is the effect of the *Maſter-Workman*; but the formall light is a cauſe and vitall act. Again, the Splendor differs from the *Archens* as light doth from matter, and therefore the whole Being of the Splendor is terminated in ſhining; but the light of the form is ſo annexed to the thinglineſs or eſſence of it, that they are formally one and the ſame, being diſtinguiſhed onely by a relation: And ſo, altho ugh the formall light doth ſhine; yet its act is not terminated in ſhining, but in an eſſentificall thinglineſs.

73 And therefore brightneſs and ſhining are indeed the beginnings of degrees to a fireable light, and the heats thereof; whereas the formall light, differs in the whole general kinde from a fireable light, and therefore it knowes no degrees; but hath diſtinct, and diſtinctive Species or ſhapes in its formality, as well in the ſpecificall eſſence, as in the individual eſſence: And therefore nature ought to receive its ſpecificall diſtinctions from the formall

74 light, it not being otherwiſe able to diſtinguiſh it ſelf from it ſelf, unleſs by ſome former thing which may contain an act of diſtinction: As neither to perfect it ſelf, by it ſelf, unleſs it doth receive that from ſome former thing, efficiently perfecting. And ſeeing that Forms do actively diſtinguiſh things themſelves, and perfect them, a Power of infinite wiſdom, foreknowing from end even to end, is conſidered in them. I have already taught before, that the light of the Sun falling on the Earth, meeting with the light of the Moon, they do mutually pierce each other:

So the light of our Soul may touch, and immediately pierce all the forms of all things, ſo it hath but once loſt the contagions of its Body: But as long as it is the companion of the Body, it pierceth forms ſubordinate to it ſelf: which thing is ſignified in the Word; *He hath put under his feet the Birds of the Heaven, the Cattel of the field, and the Fiſhes of the Sea.* For whatſoever the immortal Soul (I ſpeak not of the ſenſitive) doth iſſuingly think of, it alſo reacheth to that very thing, even as in the Treatiſe of the *hunting or ſearching out of Sciences*; and in the *Squalldron of Diſeaſes*. So likewiſe the minde pierceth alſo its ſenſitive Soul; and ſo they do derive the thoughts of the Soul into the Body. On the other hand, the concepts of the ſenſitive Soul (to wit, while a man being aſleep, thirſteth, is hungry, &c.) do aſcend into the heart, and oft-times do ſtrike the immortal minde.

76 Hence therefore it followes, that all the properties of things, as well hidden, as manifeſt, are imprinted on Bodies by reaſon of a formall co-touching, ſo that at length they do alſo deſile even the deliberations of the formall ſubſtance: As when a mad man doth but even lightly wound the ſkin with his tooth, preſently thereupon, the reſembling mark of madneſs is propagated or increaſed in the light, whereby the ſenſitive Soul, and minde do touch each other.

77 But God, although he hath an immediate co-touching of all Forms; yet he is not likewiſe touched or reached by any form; but by the Soul actually mediating or intreating in the
Symbole

Symbol or resembling mark of good; and that, as being his Image, reflecteth it self upon God. But other forms as they are frail or mortall, so they have no right of acting on the infinite, substantial, and thrice glorious light. Therefore from what hath been said before, it is certain, that what things are innocency in *Aristotle*, are the blasphemies of the Schooles; in saying, *That if God should act any thing immediately, he ought also to suffer a re-acting.* And that the immaterial God, doth make use of immaterial instruments, that he may work or do any thing. Moreover, seeing the minde of man doth most nearly shew forth the Image of God, is immortall, and therefore is not capable of suffering; I could not perswade my self that it is so restrained to the lawes of the Body, that it can suffer by this Body. I know that this is true, that while health remains, the chief powers of the minde are often troubled: Therefore I acknowledge one health in the Being, and another in the Mind: yet I cannot comprehend that an immortall, spirituall substance can suffer by an infamous excrement which in no wise reacheth it: For whatsoever suffers, that is made by a stronger Agent, and subjecteth it self unto it.

But a frail Agent, capable of sliding every hour, and every way limited, cannot be stronger than an immortall and spiritual Being, with which it hath no resemblance, nor co-touching. Therefore the immortall minde is not mad, doth not doate, sleepeth nor through Opiares or sleepy Medicines, is not estranged through the exorbitancy or irregularity of hypochondriacal melancholy, doth not vary through Lunatickness or Frantickness at a certain time of the Moon, neither stumbleth it through Wine, as neither doth it feel madness through the stroak of a mad Dog, or the *Tarantula*. Therefore madnesses, and the alienations of reason are not proper to the minde: But this being afterwards afflicted by corrupted nature, through the weariness of the body, hath committed its Vicarship to the sensitive Soul, which it pierceth onely with a vitall beam, that it may be, and live, may be entertained, and rowled up in it; but as to any thing else, it beholds it ill-favouredly, onely crookedly or by the by.

But the sensitive Soul in a man, is not the specifical form of any bruite beast, and much lesse an individual one, that it may be a bruite beast, before it is a man. They were doubtful in this thing, as many as before me have thought the forms of bruite beasts to be substances, and to be taken immediately out of the very substance of the matter, not a new light to be brought down from above by the Creator, which may not be a substance; but a light which may be the band of a specifical oneness: Without which, all the endeavours of nature, dispensations of bodies, excitings, and splendors of the Air, are void, and so whatsoever endeavours of seeds are enticed out of the bosome of nature are vain and barren. For the *Archeus* cannot give that which he hath not, neither hath he that which is far narrower than his own nature. Therefore the Creator doth enlighten or illustrate the *Archeus* with a light of specifical essence of thingliness, after an unutterable manner, and also co-knits it into the unity of a composed body: And there is in the sensitive creatures a Soul, or sensitive life: therefore in its moments of maturity, and period of appointment, the bruite conception is soulified with a specifical formall light: but seeing the seed of man hath not a specifical determination unto brutall dispositions (unless a Woman with young doth by chance through imagination, alienate the figure of mans seed) and the Almighty hath knowledge, whence, and whither all seeds do flow, when now it is come to a life in man, it receiveth an undistinct sensitive Soul, as to its brutality, in splendor, enjoying onely life; and also at the same instant, together with life, the Creator coupleth an Immortall minde, that by this ultimate act the sensitive Soul may be limited to a species or particular kinde by a humane individual: yet it is to perish together with the life of man, because it is coupled indeed to the formall and immortall Substance; but is not united, nor pierceth the same, but onely toucheth it irregularly, even as in the Chapter of long life: therefore the sensitive Soul is specifically limited by the minde, as it were light by a clear substance, else it should be unfit for the union of the body: And so its subordination to a further act, in the conception of the Creator, takes away from the sensitive Soul a specifical limitation: because the being of a subordinate Form doth not appoint or limit the name, or Species of a thing, although it actually exist in the individual.

And that also, because the sensitive Soul is not a substance, or an accident, but a neutrall light some nature: For neither is the vegetative Soul the form in a bruite beast, whiles he onely groweth, and doth not yet perceive: because it is subordinate to the sensitive Soul. Many therefore have thought, that two formall acts do not suffer together with each other, because they thought they were two substances; and they contradicted themselves in the fire, and in the white.

while they might see light to pierce light, fire Iron, yea and fire to be pierced (by the bellows) with adjoynd fire.

- 83 Lastly, the sensitive Soul in bruit beasts is not a naked promotion of the vegetative Soul, or a passage to a more perfect state of it self: that, that coming to it, this should decay, or that this should be changed into that: For none hath said, that the souls of Plants are an accident; but all confesse them to be a vitall subsisting Being: For they are vitall Souls, but not proper living souls: For so a Plant waking dry, its vitall light perisheth with its soul; yet for the most part, the virtue of that simple remaining long: I have said for the most part, because the root of *Anemone* or Wind-flower being plainly dried into wrinkles, doth as yet wax green or revive again, &c. Therefore the operations of Souls, and their effects do remain different; So that the functions of one Soul may be extinguished, those of the other being unhurt: Therefore the severed lights of the Soul, and the subordinate ones, are limited to the bound of an appointed duration, in motion: In which bound; unless they are pierced by a light coming upon them, they straightway cease to be. Therefore this vitall light differeth from a fiery light (as I have said) in the end, meanes, Instruments, effects, and properties: Because a fiery light in a slack degree, is not at any time living, nor vitall, unless occasionally, as it stirreth up: But in a heightened degree, being reduced by the folding up of it self together, it is a destroyer, and an artificial death, and a simple Creature: whereas otherwise, the lights of Forms are divided throughout all the Species of things: Seeing things do not elsewhere draw their thinglines, than from lightsome Forms. And we may easily measure the diversities of lights, if the same light of the Sun being, repercussed or struck back by the Moon, can so easily change its properties.
- 86 Last of all, the *Archeus* of Mineralls is plainly materiall, liquid, covering a hidden and drowie brightness under thickness, which is more growing, and liquid in Plants: but in the four-footed Beast it openly floatech and shineth; so that the living Creature dying, a failing splendor may be presently seen in his eyes. For feign an Oxe of 800 pound weight, which the light of life being extinguished, is straightway cold: Therefore that hot light must needes be of so much moment, that it may preserve so many pounds rushing into cold, by its continual nourishment, from cold.
- 87 Therefore the light of four-footed Beasts, and Birds is Sunny, no otherwise than that of Fishes doth prove it a Splendor of the Moon: For there is no seldom example of the cold light of Fishes: by night I say, in shrubs or tamarisks, Earths, and combustible things: For there is a light, and that a kindled one, a shining exhalation without fire and heat: For now and then, I under the thickest darkness of the night, clearly distinguish lines under the aforesaid light. Suppose also after the same manner, Vegetables to obtain a twofold light, from the nature of light, but not of an Element, because all things do consist of one onely Element. Seeing therefore the Schooles have been ignorant of the properties of Lights, it is no wonder that they have stumbled in the degrees of Simples.
- 88 And so, another judgement is hereafter to be given concerning the degrees of Simples, according to their participation of more or lesse light from their governing light. That which the art of the fire declareth, by the separation or withdrawing of the lightsome Being from the other part of the composed Body: which thing is scanty or difficult enough to many; but
- 89 to the *Adeptists* very easie: For by the fire of Hell, which is the Liquor *Alkalest* of *Paracelsus*, it may be known, how great a part of either light a Vegetable (even unknown, bruised, and covered in its Scituation) may possess, no lesse than with what shape or figure it was adorned: And that, not by the perswasion of *Quercetanus*, who when he had seen a weak
- 90 *Lixivium* or *Lye* to be congealed, thought the feminall Being of a nettle after its turning to ashes, to have remained in the Salt of the ashes; because the Ice beginning, doth contract its drops point-wise.
- 91 *Paracelsus* also is deceived, because he writeth that all Vegetables cannot exceed a heat of the first degree. Indeed the great Lights have wonderfully shone in Simples, and their seeds do ascend for the grace of the Universe, to a largeness of degrees, and therefore all Forms have a light of essentificall thinglines, reduced to the conjunction of either light. Yet
- 92 the lights of the Luminaries are not the constitutive Forms of Simples; for that, the light of the Sun is combustive or burning up, even in its simplicity. Therefore it is a shamefull thing, that a man and the Sun doth generate a man: Because it is that which is stuffed with the Idiotisme or proper form of speech of Heathenisme. In the next place, the seeds of Birds, and four-footed Beasts are at first muckie or snivelly, because they are perfected by a very small help of the light of the Sun: But they are contracted and thickned by little and little, that
- 93 they may be sufficient for the consistence of their generated young. In the mean time, the Eggs

Eggs of Fishes are at first more hard, and straightway the light of the Moon assisting, they wax tender into a snivelliness. Therefore there are two great Lights; and those sufficient, as there are so many primitive Elements. The Sun is chief over the Air, as the Moon over the wombs, or Motherly Waters. Wherefore a living Creature brought forth by the light of the Sun; hath need of a continual sucking of Air; as also Fishes are constrained uncessantly to draw waters for the sustaining of themselves, and the refreshment of their light.

I have known indeed, the light of the Sun to betake it self into a Flint (to wit, onely by the preparation of the Flint) that without the presence of the Sun, that attained light may remain for some space under the thickest darknels; and again, the light is drawn out by a new exposing of the Flint to the Sun in the day-time, although clouded. Therefore this was the necessity of inspiration, not to be despised by us; to wit, as a restauration of the lights contained by a certain consanguinity in seeds, doth happen; but not onely a desired temperature of cold alone; as the Fish witnesseth. It sufficeth therefore, that no form of naturall things is produced by the Heaven, by the Sun, out of the dreamed appetite of the matter, or whatsoever disposition of the seeds; because that all these things are included in the race of accidents: neither have they known the way to a creating of nothing: For nature is not able of it self, ever to ascend to the procreation of a vitall light: but Christ the Lord of the Universe, is alone the life and parent of all things; neither will he give this honour to any Creature. Therefore God alone is the Father of Lights. But he is not so called, because he made the Stars: For as he is not called the Father of Stones, or of things not living; so neither of the Stars. Yea, neither is he therefore called the Father of Vegetables, although they have a certain vitall light in them. Therefore the Father of all lights, is he alone to whom onely the name of Father belongs: And who is onely to be called Father, and is in the Heavens. For although a fleshy Father doth give of his own, whence the name of Paternity or fatherliness is given unto him: yet because he is not the giver of vitall lights; or the Creator of Forms, he name of vital Fatherliness is forbidden to be given to the Creature. Therefore God is the Father of Lights, or of vitall Forms. And there are as many of those diverse lights, as there are of vitall forms: For because Souls are not known by a notion from something before them, or of a precedent thing: therefore, are they by a general Etymologie, called Lights, with a Son-like property, whose correlative is a Father: Yet so, as that paternity is by way of proportion or similitude: For although he truly createth all living Souls; yet Beasts do not assume the Sonship of a proper name; because, neither the likeness of that their father: For their souls do perith with their life, in manner of the flame of a Candle. Therefore the mind of men onely is an immortall substance, shewing forth the Image of the Father of Lights: and therefore power is given to him of becoming the Son of God. Which things, seeing we believe by faith, I am angry that even still to this day it is taught by Christians, that the forms of things, and souls of brut Beasts are true and spiritual substances; by consequence, that they are not vitall lights, nor created by the Father of Universal Lights, but are given and made by the Sun, and likewise raised up out of the power of the seed. As though a spiritual substance could be created by the power of a matter. For I esteem that thing to be retained in the Schooles among the sweepings or drosse of Heathenisme; but not without wronging the Divine Majesty: To whom all Filial or Son-like love is due.

CHAP. XXII.

Magnum Oportet, that is, it is a thing of great necessity,
or concernment.

1. The unconstancy of Paracelsus. 2. The birth of voluntary things by their generall kinds. 3. The disagreement of Archeusses. 4. Very many accidents do remain in a new generated thing. 5. Species are to be added to, or diminished by *Oportet* or necessity, contrary to Aristotle. 6. The error of Paracelsus in *Oportet* it self. 7. Accidents do change their own proper formall objects. 8. A contrary perswasion hath hitherto overthrown natural Philosophy. 9. How the same accident doth wander with the middle life of a thing. 10. From whence there are so many diversities of natures in a man. 11. That feigned whorish appetite of the matter. 12. A demonstration of the error. 13. Whence the necessity of things, really, and principiatively, is. 14. The Schooles have not taught true Beginnings. 15. Some things are corrupted in the Air, but other things are preserved. 16. Whence the corruption of things is. 17. Corruption is onely of the matter. 18. What corruption is. 19. Corruption is not from privative things, contrary to Aristotle. 20. Corruption and generation do not reciprocally succeed. 21. The unadvisedness of the Schooles. 22. What *Magnum Oportet* may be. 23. The Earth, but not the Water shall bring forth Thistles and Briars. 24. What kinde of digestion there was before sin. 25. What is the misery of Thistles. 26. Odours and Savours are fundamentall Ferments. 27. The error concerning the eight tastes. 28. The three lives, their flowings and ebblings thorow the three Monarchies of things. 29. Why Warts do perish through the touching of an Apple. 30. The foundation or ground of Sympathy. 31. The going backwards of life. 32. A threefold life of Mineralls. 33. Properties are in a place, and in the thing placed. 34. What the double nothing is, in the words; The Earth was empty, or without form, and void. 35. It is proved by the Handicraft-operation of a Flint, that Light is a Being without a shining light. 36. Perceivings are in the Instruments of the Senses. 37. Which way the *Magnum* is serviceable. 38. Who are the immediate Citizens of places. 39. The originall, and progress of Metalls. 40. A more manifest progress of life in Metals. 41. Whence Mineralls are of so great efficacy. 42. The dignity of the Archeus before sin. 43. Which are the ambulatory or walking qualities. 44. That which the Schooles cry out to be impossible, is necessary in nature. 45. Whence that error is. 46. Some absurdities following from thence. 47. A frivolous Maxim. 48. The blindnesses of the Schooles are to be pitied. 49. Why the objects of sight do more work in one that is with young. 50. Adeptists do walk through the objects of sight. 51. Some Speculations in the position of the appearances of Spirits. 52. The distinctions of qualities by modern Writers or Philosophers. 53. The occasions of Diseases. 54. The manner whereby a Hydrophobia or a Disease causing the fear of water is made. 55. The same concerning other poysons. 56. The successive alterations of poysons. 57. The manner whereby poysons do work. 58. Con-

38. Considerations about the activity of poysons. 39. The blowing out or extinguishing of life, in what manner it happeneth.

Surely I have thus at unawares fallen from the Elements into the birth of Forms; and there I have distinguished of a fourfold Form, diverse in kinde from each other.

1. To wit, an Essentiall Form.
2. A Virall Form.
3. Next a substantiall Form.

4. And at length, the excellency of a formall Substance, I have added for the end or top of nature. For when I had explained my Doctrine concerning the Elements, I fell by degrees into the History of virall things, and consequently also I perceived my self devolved into the necessities of Diseases and death; indeed, that I might apply the beginnings of naturall Philosophy to the end of humane appointment: Therefore have I come to *Magnum Oportet*: To wit, I have come down to the flowings and ebbings of life, and so to the hidden calamity of death. Wherefore all our consideration of nature shall hereafter become Medicinall. For truly, *Paracelsus* being not constant enough to himself, stumbled in the finding out of the cause of a Disease, in the mean and manner whereby every thing tends to a declining: To the clearing up whereof, I have already taught before, that the fruits which antiquity hath believed to be a heap of Elements, are the off-springs of the one Element of water, begotten with childe by the seed, which disposeth the water to generate in places, as it were in wombs: For wheresoever the water obtains an Odour, it straightway also conceiveth in that very moment, a Ferment, and after that a seed, in the begun disposition of the matter disposed by the Ferment: For truly most things are made for the sake of the Odour alone. For oft-times, the Root, stalk, pith, leaves, and History of a whole Plant, is born by reason of the flour of the Odour, or Odour of the flour, and the Odour is the ultimate end of many particular kinds, as well in Plants that are for Sauces, as in those for Medicines. Because out of Sand, or simple Earth, and Water, doth grow nothing at first, but a moyst filthiness or mouldiness, they contract a putrefaction through continuance, or Odours. For nothing putrifieth by continuance far under the Earth, neither doth a Plant grow in the Sand. But almost nigh the light or day, the Odour is putrified by continuance, and *Leffas* brings forth its Plants. If one part of mud or dung do putrifie in the Earth, it may beget the water with childe in a five fold weight of it self, and send forth fruit: For the water being void of all Odour, unless it shall conceive the Ferment of an Odour in its Sulphur, surely it remains in its ancient simplicity, as Rain-water, without fruit. Therefore in the deep Pavements of the Earth, where there is a departure far from filthiness, putrifying, and corruption, although there be no *Leffas*, yet the waters are got with Childe by a hidden Odour of the place; first of all, by an unconceivable contagion of a certain Salt, straightway they do hasten to the more wealthy Colonies of Fruits, and do break out. Indeed its own strange fermentaceous Odour dwells every where, which may get the Sulphur of the water with child, and sleeping within it, may at length grow together; As in Mineralls: Or being grown together, and even over-spread with a thicker Air, may grow, as in Plants, and Creatures that bring forth Eggs: or wholly from the beginning, the form of the Air doth glister; Even as in things that bring forth a living off-spring. Therefore the *Archeus* being now conceived, remains every where the keeper of life, and the promoter of transmutations, and by and by, a change of his life doth follow the change thereof, to wit, from his first life and matter, into his last. For the *Archeusses* of things do agree in this; as being virall, they do possess a certain Splendor: yet they differ, as they are unlike fore-runners, and Stewards of the Form. Yet they do not mutually receive each other, least their government be disturbed; but for order sake (which they do badly explain by the Title of self-love) he remains Master, who shall be the stronger: which way indeed they liberally dispense the Impressions of their Ferment, that one may restrain the foreign disquietnesses of his fellow *Archeus*, and may subdue him: For even as under the immortall minde, the subordinate forms of a bone, membrane, &c. do not perish: So also it happens in the transmutations of things. Indeed, although the food doth by an every way transmutation, obtain the form of blood; Yet this keeps no obscure accidents of the former food, which do therefore walk from one matter into another. Surely this is a hard and Paradoxall saying in the Schooles: which I will presently prove by an example of the deed: Nigh the Mountain at Zome, a Hog, the Sea departing,

is fed with Sea-Onions, shell-fishes, &c. His flesh savours of the grease of a Fish, yet it is Hog-flesh, forbidden to the Hebrews.

- 5 Therefore it is vain, that the Species of things, are as it were the species of numbers, whereto, not a unite is added, or subtracted, but the species it self is continually changed. For one onely flesh of a living Creature, doth receive strange favours through the variety of meats. *Irish Oak* doth so retain the properties of an *Antidote*, that it chafeth *Spiders* from our Buildings: which property, our Countrey Oak wanteth: For the passings over of accidents do not happen in meats, through want of a perfect and essential transmutation: Neither also doth Urine smell of *Terpentine*, *Mace*, or *Asparagus*, as some excrementitious part of the meat may remain with the blood in the flesh: For that lesse resisteth a perfect transmutation, separation, and election in things due to the *Archeus*, in whom, to wit, there is perfectly a transmutative, dispositive power of the matter into figures, Odours, Colours, and every property of accidents.
- 6 For *Paracelsus* hath now and then made mention of a middle life, and matter; but he hath not owned himself in the greatest necessity, whereby he dreamed of Tartarous humours: For he had seemed to secure the matter to himself by the example of living *Tartar*, if he had obliquely or by the way immingled a co-like *Tartar* in meates and drinks, to the finding out of the matter, and originall of Diseases, not yet discovered before. For neither hath he explained, from whence it is, that notable favours do survive after the true transmutations of meates.
- 7 Wherefore it must needs be, that the same accident in number doth passe from its subject, that it is (I say) in the formall transchanged thing, which was first in the thing to be trans-
- 8 changed, although the form of the subject of inherency shall fully perish. Because although the matter doth not remain, yet the middle life remains, of which nothing hath hitherto been heard in the Schooles. Indeed the middle life remains in the transchanged *Archeus*, no otherwise than the form of a bone, a man being dead.
- 9 For although there be a fermentall virtue in the stomach which resolveth things carried into it, and afterwards, the same things be perfectly transchanged in the other shops or places of digestion: yet so, that nothing can be so perfectly transchanged in us by assimilating or making like, through the immediate flowing of digestions, as that there do not remain for the future, the more dull qualities of the middle life of the former composed Body.
- 10 By which necessity indeed, the accustomed nourishment of divers Climates doth imprint into the sound parts, very strange or forreign contagions of properties. Whence do happen, so many unlikenesses of deformities of one humane nature: the which surely, I could never dedicate to the vain complexions of qualities. Indeed Swines flesh is Swines flesh, although the horrid taste of Fish-grease shall remain in its middle life. Which thing being never before considered, hath made the whole contemplation of nature, barren. For truly this hinge hath been neglected in the Schooles. For *Oportet* is a thing altogether necessary, whereby the qualities of the middle life do remain in things that are transchanged: For unless that be granted, there shall be no power of Medicines, as neither occasion of Diseases: For nothing doth more prosperously operate to heal, than that which hath most fully entred by the transmutation of it self, and is neereft united to that which ought to be healed. So a grain dies in the Earth, that by its middle life, it may stir up new off-springs for usury. Also in meats, although the former forms of meates have wholly perished; yet the operative properties of the former middle life have remained; and that into the second, and now and then the third transmutation of the thing generated. For the native property of the middle life failing by degrees, under the dominion of the *Archeus* ascending, to wit, of whole Ferment it is the subdued matter:
- 11 That indeed is *Magnum Oportet* in this Valley of successive changes; but it is not the whorish appetite of an impossible matter: For *Aristotle* feigned a matter deprived of every accident, as also of all essential Forms, and he appointed this *Chymera* to himself for the Beginning of nature: And so he constituted for a material principle, not indeed a naturall Being existing in act, or possible in power; but a Mathematicall corporality or bodiliness; but not [this something] or a principiating Beginning: For he thought that nature was at an imaginary pleasure, to hearken to figures, and measures. In the mean time, that that matter might be principiating, he feigned that a certain motive principle did agree or belong to it, to wit, a universall appetite unto any forms unknown to it self: Which Dreams, although they are ridiculous, agreeable to no end, use, or necessity, and bringing forth many absurdities from them; yet are they at this day adored by the Schooles, who have made themselves ridiculous thereby: Seeing there can be no appetite of that corporiety, breathing

ing to any perfection which it had not before in it self: To wit, that it may be capable of forms, and figures.

For otherwise, in the consideration of nature, and indeed in a principiating Being, every 12
appetite of a Being is carried to perfection; not any one, but that of the seed fore-existing in the disposition of the ferments, and so also operating: But a seed doth not aspire but to the limitation delineated or represented in the disposition of the *Archeus*. For truly as learning by demonstration doth propose to it self a Body capable of all figures without any accident; So *Aristotle* hath brought this Speculation according to his pleasure, into nature, unknown to him, and hath introduced an appetite into this matter, the lover, and one onely cause of successive change: Even so that he reckoned the first matter to be void of all quality and form; but endowed or given up to all and any forms, onely by a whorish appetite: Not knowing in the first place, that successive change doth proceed not from the appetite of the matter, but from the instruction of the seeds. Neither have the Schooles once looked back, that the desire of remaining is more antient, strong, and naturall than the desire of permutability or much changeableness; and that the Schooles themselves do contradict their own *Aristotle*, who will have every Being to desire to remain from the proper endeavour of nature: Seeing it is of necessity a Being, before it can think of a change, or wish for it. Therefore the matter ought to have obtained to be perfect, before it should disdain to be old, and should desire a successive change. For to be, is before, to please; and to please, is before, to displease; and nothing can displease, or wish for a successive change; but as a pleasure being gotten and known, something more perfect, possibly also better, is shewen. For in the more crude seeds which have conceived their first ferments by Odours, the Odour goes before the complacency or good pleasure; but this doth generate a desire of it self, and of a thing remaining: But in things possible, desire causeth the same appetite of remaining, but not of perishing, by the changing of its Being. But if indeed by reason of the hidden impediments of death, a permanency is not granted; there is made a dissolution in Bodies, but thence a weariness: but from weariness there is a proceeding to a remove or change through the ruling virtue by degrees declining, from whence at length destruction is not intended, but following after through necessities. It belonged to the Schooles to have known, that to be, doth alwayes go before a wearisomness unto a non-being: because this wearisomness is not of the intent of nature, but rather an imaginary Metaphor or translation succeeding upon the defects of things: At least, that this wearisomness ought to precede the desire to a non-being: And much more a desire to a new Being, and unknown to it self; Seeing a new Being is not granted before the death of the present Being. In brief, because also the wearinesses of the displacency of the appetite do but dreamingly agree to a non-being: And at length, because from dreaming principles so absurd, nothing is to be expected besides errors full of confusion.

Therefore successive change in nature, is not from the desire of the matter, but from the 13
power of the efficient *Vulcan*: Wherein the Odour and Savour of the middle life: do generate a seminall Image, the beginning of transmutation: For neither are the Schooles as yet constant enough to themselves in that appetite of the matter; yea the Schooles do not seem to have taught the speculative principles of nature for the service of the truth. For truly, when 14
they descend to the things themselves, they do no more blame the appetite of the matter for the corruption of a thing; but they blame the Air as the effecter of all corruptions whatsoever: But I know that many things are dried under Air, which otherwise, under the Earth, or water, do putrifie presently.

For truly, Glasse the last of things putrefiable, doth in the Air remain as it were for ever: 15
But being buried, after some years it admits of a putrifying through continuance, is covered or entowled with a Crust; its Salt being dissolved, it decays; and its constitutive Sand remaineth. The Air is a Case, in whose porosities some things do dispose themselves into successive alterations, some things under the waters, and many things also under the Earth, according to the dispositions of the seeds.

For truly, those things which do sprinkle from themselves an Odour, do loose the same by 16
the flowing and snatching wind; or the Vessel being close shur, they do retain the same within: For if the former, the pores of Bodies being afterwards empty, they do receive Air; which being there enclosed, doth putrifie through continuance, with the odourable thing, whence the residue of the Odour doth receive a ferment, doth draw a waterish filthiness from the said putrefaction by continuance, and becomes rank, or muckie: But if the latter comes to passe, then the Air there detained doth cause the composed Body, to putrifie by continuance, and brings it to corruption, unless the odourable Body hath the properties of a Balsam: because

because a new ferment thinks of a successive change. Volatile, or exhalable and swift flying things do easily decay. (because for the most part, they have a diversity of kindes, through want whereof, distilled things are scarce corrupted) one whereof doth ferment or leaven another, from their true Element they are even choaked, and do putrifie through continuance, or do conceive an air as before. Therefore the ferment changeth the thing, as it alters its Odour according to the essence of the matter imprinting of the Vessel of the place, or of the thing adjoynd: which things I prove by this Handicraft-operation: For truly, I do preserve the broaths of fleshes, of Fruits, even as also any boyled things, (otherwise soon subject to corrupt) for years, from corruption, so that I shall poure a balsamicall ferment into the Air, and that ferment being continued, I shall restrain it.

17 With me therefore, corruption is thus, as I have said: Forms are never corrupted: they die indeed, onely the minde of man departeth safe, but all other forms do perish: But matter neither departeth nor dieth; but is corrupted: And so, corruption is onely of the matter. Therefore corruption is a certain disposition of the matter, left behinde by the ruling *Vulcan* decaying.

18 For as the Body saileth its Ruler or Pilots being in good health, it being safe doth not hearken unto strange ferments.

19 Neither is corruption therefore to be numbred among privative things, if it consist of positive causes: Wherefore another Beginning of *Aristotle* in nature falls to the ground: For truly the *Archens* is not of his own accord taken away, disperfed, changed, or estranged, unless by a new one troubling him under another ferment. Therefore strange ferments are chief over all corruptions, and by the interchangeable courses of ferments all corruption begins, doth by little and little ascend unto a degree and pitch, and at length having obtained its period, is terminated: For there are some things in whom the proper lust of their seeds is wanton, and calls them away from the tenour of constancy, to undergo the transmutations of successive changes, not indeed by reason of a desire to another form; but because the implanted Balsam of nature is easily blown away, and perisheth; as are fleshes, and Fishes: But others do change their Wedlock, not without a putrifying being first stirred up, and do put on the careful governments of new seeds: As are Woods, Stones, and Glasse which is most constant in fire: Among which, they do interpose in a middle degree, for whom the touchings of the place do cover their Superficies with a hoary putrefaction or mouldiness: From whence Odours being disperfed, they do disjoyn the Wedlocks of the antient seeds, and meditate of a new Generation by dissolving. It is a mark naturall or proper to the Air, uncessantly to separate the waters from the waters; and there are many things which do not endure such a successive alteration without a spot or corruption; hence therefore they do most immediately slide into a sudden disorder: Therefore corruption, as it includes an extinguishing of the naturall Balsam; so the constancy of a thing desires its continuance: for in such things whose Balsam doth voluntarily flow forth or expire, it being joyned to fixed things, they are seasoned therewith, it sticks fast, is restrained by the bolts of dryness, or at leastwise is nourished by a predominating ferment that is no stranger to the disposition of a Balsam: For so, sweet things, smoak, Salt, Pepper, *Agua vite*, Vinegar, distilled Oils, do preserve fleshes. But at leastwise about the end of life, there is on every side a great confusion of the thing, and a large losse of strength: So that seeds serving to the lower conjunction, do oft-times die together, from whence the chief assisting *Vulcans* of things being as it were fore affrighted with fear, and as mercenaries, do first run away.

20 Therefore although corruption doth induce a transmutation, with the death of another thing, it is not a privation, neither doth it therefore necessarily follow generation, as neither this, it: Even as those things which exclude each other by a succeeding presence, as otherwise, light and darkness do. First of all, our death subsisteth without the failing of the form, without a necessitated destruction of the matter, if the Mummy doth continue; although it includes a separation of the life or form: For that doth not shew corruption to be present, although it doth straightway follow of its own accord, and be preserved by art: At leastwise it sufficeth, that corruption is not made the immediate heir of the thing constituted, nor that it necessarily succeeds from its dying without a will. So neither, when a thing proceeds out of a seed, nor any corruption of the seeds doth go before, or accompany it: For it is an incongruity in word and deed, that the promotions, perfections, and maturities of seeds have regarded corruption. An error of rashness is maintained in the Schooles, through ignorance of naturall principles: As that those things which are the works of nature, are thought to be non-beings, to be banished into the abstracted considerations of Learning by demonstration.

Truly when *Aristotle* was connived at, to put (by a large word) Privation between a Being and a Being, he began by taking a liberty, to substitute corruption in the room of privation. For that privation, as it was not a Being, and so a dreamed Being of reason, it was yielded to by a liberty transumptive or of taking one thing for another, without taking heed. But the Schooles had understood that the same right ought not therefore to agree to corruption, if their sluggishness of assenting could have suffered them to be distinct. Wherefore the whole Stage of nature hath stood neglected through the thoughts of the Gentiles: For truly, the fermentes, Vulcans, and flowings of seeds being neglected, all the efficacy of Nature hath through the undeserved orders of privations, been wrung aside into the fables of heats and colds, their discords, hatreds, skirmishings, and contrarieties, and have made the searching into naturall Philosophy ridiculous.

Moreover, I have called *Magnum Oportet*, A necessary remaining of the properties of the middle life, in the thing nourished and constituted. From whence it followes, that the same remainder of the middle life, from meats and drinks, are the Thistles and Thorns which the Earth was to bring forth after the fall, or departure out of the right way: otherwise, Thistles & Thorns, as they are Plants, are Creatures, made for the use and adorning of the World before the fall. I have also sometimes vainly thought, that the tartarous humours of meats and drinks were those Thistles and Thorns: Because the middle life subsisting (but it subsisteth by a reall and true act) it was in vain, to feign forreign *Tartarers*, as shall be shewen in its place.

But observingly, it is not included, that the water shall bring forth Thistles and Thorns, although it may bring forth its discommodities: For the fleshes of men, and bruits living on the Earth, do shew forth the aforesaid Thistles. But Fishes are nourished within and without, and are washed thorowly with Salt, yet are their fleshes sweet: But those which inhabit in mud, do expresse the Thistles in the savour of their fleshes, not from Water, but from Earth. Before sin, our *Archeus* had not only perfectly transchanged meats after a daily manner, but had supt up the whole properties of the middle life into his own rule or jurisdiction, as if he were their Master. For truly, the immortall minde being then as yet, without the mean of the sensitive life, was the very immortall life it self unto, and not capable of suffering by its own Body: Even as touching long life, in its place: For Paradise, in this respect, had excluded death, because it had excluded a successive change of us: But the Tree of knowledge of good and evil alone, had retained a property to it self, that it could imprint, to wit, the dualities or double properties drawn out of things on our *Archeus*; because the Companions of the middle life do easily adhere to each other: Whence a Gate was laid open to duplicities, interchangeable courses, successive change, and disorder. At length jarring, the breaker of agreement, thus brought in the apple of discord.

For we afterwards feel the perpetuall Tyranny and multiplicity of Thistles and Thorns. For as many specifical Savours and Odours as there are in things: so many forreign properties of the middle life are suggested daily by nourishments: For these are the strange fermentes, by whose interchangeable course we are wearied or much troubled: For truly no generation doth any where happen, which a foregoing disposition in the matter hath not stirred up: therefore such a ferment alters the inbred Savour and Smell of things, whence the *Archeusses* are by little and little withdrawn from the obedience of the seeds, and do hearken to the mockeries or enticements of a forreign ferment. In brief, the remainders of the powers of the middle life, as well in nourishments, as excrements, are almost the occasionall Beginning of all sicknesses, and in this respect to us, of the Thistle and Thorn.

For Odours and Savours do bring forth a desire, a dislike, or a neutrality in the Bodies of seeds: But an appetite being thus moved, doth paint an Image in the *Archeus*, no otherwise than in the Young of one with childe: which Image is the invisible essence of seeds, stirring up to embrace, or abhorre: But the neutrall Odour serveth for station and rest.

If therefore in the middle life, Savours do as yet remain in things transchanged: it is frivolous, that things shall weigh their vertues, and essences by eight material, and not specifical tastes. Furthermore, seeing it is called the middle life, in respect of two extreames:

The first shall be of the received and working seed seated in the *Archeus*, he being endowed with a power of managing things: Which, when it hath obtained some maturity, as when the seed is a Body, having flesh, and tender bones, according to the requirance of the Species; then is the middle life of a thing present: For it is meet to measure the life it self by the *Archeus*, as it were the Mediator, the Instrument of life. Therefore the first life doth glister in the seeds, but in the Embryo or imperfect young, the middle life: But the last life is, when the totall perfection of the constituted thing is present: which indeed, although it be the last life of the thing, yet is it the middle life of the *Archeus*, if the first life of the thing

doth begin with the last life of the seeds: For in Herbs, although seeds may seem to begin their life when they swell, and chap; yet they do then rather die in the last life of themselves, that they may bud in the first life of the thing that is to be constituted.

28 Therefore the first life of the fruit is the last of the seed. In the middle life, Herbs, Roots, and stalks do grow or increase: but Floures, and Fruits do threaten a period to the last life: To wit, this life must needs die in things, if profit be to be hoped for from nourishment, and Medicine. Medicines hanged about the neck, or head, and what things do act by the force of rule or government (of which sometimes) I except. Indeed the last lives of things ought to go backwards, that the thing in the juyce, which the *Archeus* from the beginning, married, may unfold its vertues, to wit, by laying aside the Title and property of the last life, that it may rise again to a middle one: Which death, is not an extinguishing, and a true death of the thing; but rather a transmutation: which shall presently appear in an Apple. For grain is eaten: Truly at that very moment, the last life of the grain dieth within, is reduced into its own life, the which our *Archeus* coming upon, over-shadoweth, and bringeth the middle life into its first life, by transumption or translating it, but the remaining properties of the former grain being dulled. In the death of the grain, or the last life of the seed, the first life of a new Creature ariseth together with it. To be brief: as oft as the *Archeus* of a thing is transplanted under a strange guide, so oft is there a changing of life made from the last to the first Being: which first Being is translated into a new life of the thing, and a middle life of the *Archeus* the Conquerour, onely the blunted property of the middle life remaining, whereby the going backward is made.

29 Let an Apple be cut asunder, whose inward pulp let it be rubbed on Warts untill it shall be luke-warm, and the halfe pieces being tied fast by a thred, untill the Apple shall putrifie: for then thou shalt see that the touched Warts have dispersed: For as soon as the last life of the Apple perisheth, unto which the impression of the Warts was glewed, the last life of the Warts perisheth, by going backward through the middle life: For here words, faith or confidence are not required: because, if that Apple be eaten by a Sow, or a Mouſe, the Warts perish not: For that, the Stomach doth as it were preserve the last life of the Apple, in the going backwards of the middle life, which the *Archeus* taketh to himself: But in the death, and extinguishing of the last life of the Apple by putrefaction, there is not a preserving, nor a going backwards into the middle life: And so with the death and extinguishing of the last life of the Apple, the absent Warts do perish together with it, by a Sympatheticall action of government: for the resembling mark of Sympathy is seated in this thing; Because the pulp of the Apple which cloathes the Kernel, is as it were the Mushrome of its own branch, no otherwise than as Warts are the Mushromes of their own flesh. Therefore the impression of the Warts being translated into, and sealed on the co-resembling fruit, together with the death of the last life of the Apple, the Seal dieth, and that whereof it is the Seal: For by no lesse reason, doth an efflux bear a co-resemblance with its own body from whence it was taken, than a Tune or note doth with its own muscicall Instrument, not so nigh at hand placed: For in a Unisone or one and the same sound, it manifestly leaps and triumphs for joy on a ring being hanged or laid on the string of the Instrument; but in other notes, although far greater, and otherwise higher ones, it is quiet: For where the sense of a little leaping is beheld, there is also a possible sense or feeling both of gladness, and of sorrow, and of death. Therefore it hath seemed to me to be void of Superstition, if the Wart consume through a natural sense of sorrow, a sense of its own Efflux being imprinted in the death of its last life; And so much the rather, because the Apple is as it were the Mushrome of the primary intention of nature, and of a more strong effect; but the Wart is not of a primary intention, neither hath it a Root in the whole *Archeus*: For the death of the Apple doth not intervene, if it be eaten by a *Dormouse*, as neither a death of the added impression; because the middle life is preserved, being transplanted under the preserved *Archeus* of the Apple, into the *Archeus* of the living Creature. Wherefore, although the Schooles have made mention of one onely corruption in generall; yet there are divers destructions: For some things do return from the last life into the first; but others there are, which go back unto the middle life: 31 but those things which go not back unto any life, do expect the last resolution of themselves, that they may passe over into a new seminall generation; but they rise again by their first life, at the coming of a new seed out of a Ferment putrifying by continuance. Of this sort, are those things which perish by the poyson of life, or by the death of the fire: For so, an Apple putrified of its own accord, and any dead Carcaſes, do either wax Herby with the juyce *Leſſae*, or do first breed worms.

At length, Mineralls also do shew three lives by a distinct order. It is thus: Mineralls indeed, have not a seed, with the Image of their Predecessor, after the manner of soulished things; which thing notwithstanding, hath deceived many, a proportionable or resembling flux of seeds being not rightly well weighed: For Mineralls are tied to their constitutive causes no lesse than other things; and so do proceed from a necessity and flowing of their own seeds: And therefore they cannot want a threefold difference of a feminall life: For whatsoever doth proceed without a Father, unto [this something] (as do Mineralls) it findes its seed in the Inne of places: Wherefore some things are immediately in place, but other things in the Body placed.

The winde indeed doth uncessantly flow in a place; yet its property is in some places stable: there are certain windes, and stated Tempests in Provinces: which things I attribute to the place, nor to the Air, or the unstable waters. Therefore God hath endowed, not onely Bodies with Vertues; but also places he hath immediately replenished with an incomprehensible Treasure of seeds, to endure to the end of the World: For he hath loaden places with riches, to come forth to light in a set maturity of dayes, and to put on the garment of water: For the Earth was at first without form, or empty, and void; to wit, after a twofold manner without form; because it was spoiled of naturall endowed vertues, as well in its own body, as in the places of its retirances: which thou shalt thus behold. For although the Air do flow under the Blas of the windes; yet light (because it is immediately in place, and mediately in the Air) remaineth stable: For if light may be thought to flow together with the Air, even at every instant in the flowing of the Air, light should be generated anew.

Thou mayst know that the light is in very deed, a Being without a shining light: For I keep a Flint in my possession, which if I shall expose to the Air (the Sun existing above the Horizon) for the space of three or four pauses at least (neither also is it materiall, whether the day shall be clear or cloudy) and from thence shall bring it into a dark place, it keepeth the conceived light of the Sun, perhaps for some such like space: And that is done as oft as the aforesaid enlightning is repeated: And so from hence it is manifest, that light is a Being subsisting immediately in place, nor having another Being of inherency (besides the placed essence of it self) seperable from a shining Creature: And so, if it depart from the Air into a stone, that it might also passe from the Air into the next Air, if its immediate existence were in the Air, and not in place: For truly it is alike to light, to wander out of place (its immediate subject) into the Air, or into the Flint: in that is only the difference; that the essence of light doth not subsist in the Air besides the continuall warmth or nourishing of shining, as neither doth the flame without a combustible smoak: But if it hath the Flint a fit retaining place for it self (as it comes to passe when fire possesseth Iron) it remaineth therein for some time. For hence it comes to passe, that the sight doth at one instant perceive its object, because as well light, as colour is immediately in place; but in the Body of the Mean, as it were by accident, and secondarily.

For seeing place is its subject, it findes not resistance in transparent placed Bodies, but in one onely moment light is shaken from the eight Sphear, even on the Earth: But Sound, or the object of hearing, is immediately in the Case of the Mean, and walketh without the flowing of the Air, from subject into subject: Although the Schooles in this thing are made half deaf. But an Odour or smell is not dispersed without that which is odourable, which is the Gas of a thing, which is dispersed thorow the emptinesses or Magnall of the Air.

And the Magnall is a Case or Sheath, wherein every Gas is reduced into its first matter of water. Therefore, not onely lights and colours do inhabit in places, as it were immediate guests: but Ferments, Reasons; and therefore they are placed by the Creator the Word, that they may be the Roots of successive seeds even to the end of the VVorld. Therefore Mineralls are not promiscuous every where; but certain Mineralls in set years, and places: For *Suevia* is as rich in Copper, as *Cyprus* in times past could be: Therefore cold is guiltless, as heat is vain, to the constitutions of their seeds: For places which have wanted Mines in times past, will at sometime in their day, their seed being ripe, restore Usuries not unlike to the more rich ones; because the Roots or Ferments of Mineralls, do sit immediately in place, and do breath without disdain, for fulness of dayes: The which, when it hath compleated a seed, then the Gas environing the water in the same place, receiveth a seed from the place, which afterwards begets the Sulphur of the water with childe, condenseth the water, and by degrees transplants it into a Minerall water. For it oft-times happeneth, that a digger of Metalls in Mines breaking great Srones asunder, the Wall cleaves or gapes, and affords a chink, from whence a small quantity of water of a whitish-green colour hath sprung, which hath presently grown together like to liquid Sope, (I call it *Bar*) and afterwards its greenish

greenish paleness being changed, it waxeth yellow, or growes white, or becomes more fully green : For thus that is seen, which else without the wound of the stone, comes to passe within : because that juyce is perfected by an inward efficient. Therefore the first life of a metallick seed, is in the Buttery or Cellar of the place, plainly unknown to man. But when as the seed comes forth to light clothed with a Liquor, and Gas hath begun to defile the Sulphur of the water, there is the middle life of the seed : But the last life is when it now waxeth hard : But the last life of the metallick seed, is the first life of the Metalls, or at leastwise very nearly conjoynd to it. But while that Masse doth breath Sulphur, and shuts up its Mercury within ; then I say, is the middle life of Metalls : But their last life is, when it hath attained a fixedness, and the proper stability of a vein.

- 40 Wherefore there is a more manifest progress of a life, and seed in Metallick Bodies, than in the two fellow Monarchies : For that Metalls do not require a figure, nor their whole Body so exquisite or exact : yea if the Image of seeds in things that have life, do flow forth from their own Father or begetter ; surely the typicall Images of Mineralls are to be ferched from the Cellars or Store-houses of divine Bounty.
- 41 Hence also the seeds of Mineralls are not defiled with the filthiness and wantonness of their begetters ; nor therefore do they offer themselves as monstrous : But because they are undefiled, therefore they are of famous power in healing. Mineralls therefore are to be spoiled of the possession of their last life, no more than other things, if we do expect obedience from them in healing : Else they will bring a feeble help, and will bewail that they have come in vain, because they have attained the ends of their appointments ; but are directed for the leaders of whoredoms and Riots. I will repeat what I have said above in *Eden*: our *Archeus*
- 42 was able fully to subdue all the *Archeusses* as well of poysons as nourishments, into his own increase, without any weaginess of himself, or re-acting of the same poysons, or nourishments : To wit, he could take away every impression of the middle life, and overcome it without difficulty : For the *Archeus* was immediately governed by the immortall Soul, and so also therefore was not capable of suffering : For God not onely made not death in *Paradise* ; but moreover, neither was there created a Medicine of destruction (that is a poyson) for man, in the Earth : But man being straightway cast out into the Earth, this Earth clasped Thistles and Thorns : that is, although our *Archeus* being Conquerour, doth subdue the *Archeusses* of meats to himself; yet the surviving Reliques of strange properties do remain. For the last life indeed of meates, departeth, the middle life surviving : Wherefore the more weak
- 43 stomach, feels a greater load or grief about the end of digestion, than presently after food ; as if the *Archeus* were mindefull of his ancient lost dignity. Therefore I call these surviving qualities of the middle life, ambulatory or walking ones. And so that which the Schooles do
- 44 cry out of as impossible, is a common and necessary journey in nature : as though it should be necessary for the matter of generation to be wholly stripped of every accident of its former essence, nor that it could overcome fore-going dispositions ; and as if corruption or privation should precede every generation : And so that it should be of necessity for a first matter, or summary hyle, to be actually underlaid, and immediately to go before generation, which notwithstanding, they will have to happen in an instant : For unless previous dispositions, and the ferments of those to be generated, should fore-exist in being made, any thing might indifferently be generated of any thing : when as the authority of principles being badly understood, hath forced the Schooles against this Rock, they thinking that all accidents do immediately and originally depend on the totall Form of a thing : As though the form coming to it in the point of generation, should have all the characters of its seed in it self, and had infused them before it were : But if the dispositive properties are sent into the *Archeus* by the
- 45 form of the generater, at leastwise they differ in the whole individual of the thing supposed, neither shall they have respect unto the form of the thing generated. The Schooles have neglected the perfect act of the seeds, and the *Archeus* ; as also the actualities of subordinate forms : And they have not known, that from the beginning of generation, even unto the voluntary end of the thing generated, there is not but the flux of one seed, nor at all reaching to the forms of things generated. Therefore the powers of seeds arising unto vitality or liveliness, and the lives or forms of the living thing underlaid, are concealed in the middle life of the *Archeus* : Therefore the properties of the middle life do passe with the trans-changing *Archeus* of meats, and are transplanted into the jurisdiction of the humane *Archeus*, yet much more dull than themselves. Therefore it is frivolous, that there is no accident in the thing begotten, which was first in the seed (which they do badly call corrupt.) Like-
- 46 wise also, that from the form of a thing is all the off-spring of accidents : For so, from the univocall, simple, and homogeneall immortall minde, should so many properties and inclinations

tions of men badly be fetched: But if thou shalt adjoyn the Stars to the minde, these will soon forsake thee: And the far-fetcht aid doth faint in the journey, and faileth before its striking upon it. It should also go ill with the seeds, if from the form of a vitall thing, which onely comes to it afterwards, every property and efficacy of seeds were to be borrowed. Therefore the opinion of the Schooles brings a disagreement; that generation doth presuppose corruption, and this likewise, it. Otherwise, if the middle power consisteth in the totall form, and last life of the thing; Surely Physitians deceive or blinde the eyes of the sick, when as the virall form being withdrawn out of Plants and living Creatures, they make use of these for the refreshment of the diseased. They see indeed, that oft-times in the Urine of a sucking Childe, the Odours of the things which the Nurse hath taken, do subsist: to wit, Oil of Anniseed, Mace, &c. That which the Nurse hath took, casts a smell in the Urine of the sucking Childe; and so they are drunk down by the Nurse to that end: yet they forbid the same accidents to remain safe in the thing born or begotten, which was before in the thing corrupted: Notwithstanding, that rather in every naturall point of motion and alteration, or between one and another instant, all accidents are renewed. Indeed the Schooles had rather that the light from the Firmament even to the Earth, should in every instant of places, and motions, actually produce infinite kinds of light, propagating each other by a continuall thred in every Mathematicall point of a Mean, than to grant that light is immediately brought through a place by the shaking of its beam: They had rather I say, that the smell of *Asparagus* should spring from the specificall form of the Urine, than from the middle life: For they have not known any Being but a Substance and an accident, nor a light subsisting, but immediately within the substance of a mean. Neither do they observe that they acknowledge an equivocal or double generation of accidents, while they acknowledge one to be sprung from an accident, but another from the specificall form.

But there are Reasons, why the objects of sight do more strongly move the Imagination of Women with young, then the objects of the other Senses that are more corporeal. The first is, because a visible object is in place immediately, and so doth more affect, and reacheth nearer, and pierceth the Soul, by reason of the alike manner of existing: To wit, they reach to one another by an intimate touching. 2. The other Senses do readily serve the sight: To wit, a Woman with childe seeing a *Salmon*, is carried into a desire of eating: For then whatsoever she shall take, affords her indeed actually the taste of *Salmon*, and the taste serves the sight as its Master: but it falling down into the stomach, nor she having *Salmon* really in a visible object, she perceiveth her deceit which her appetite causeth unto her; and therefore she hath a loathing, and the Woman is weakened, trembling or panting at the heart: For the appetite feigneth the taste of *Salmon*, but the womb is angry at the deceit; but it cannot transform the meat into *Salmon*. Yea, although she shall eat of another Fish, and there is an easie passage in things that have a co-resemblance; yet she cannot thereby form the longed for *Salmon*, because it is the object of taste, but not of sight: Whereas otherwise, suddenly by the object *Salmon*, or *Duck*, she easily transchangeth her Young into such a Monster: For the objects of taste sitting immediately in some body, cannot by reason of their corporeal thickness, form a transchangeative Image.

Therefore they who study in Adepticall things, do strive to promote their labour of wisdom by the objects of sight, and indeed by the light of the Moon; That indeed the Soul may be touched by a formall light, and *night unto night may shew knowledge*. As touching the Young, surely I consider it as a foreign branch implanted in the stock of a Tree, which although it be nourished by its Mothers Liquor, yet it liveth presently within, in its own proper quarter: For neither is it within as an entire part; but as it were an entertained Souldier, it snatcheth all things into its pleasure or desire, and enlargeth the Vessel it self for its own command or government. But I consider the Womb as an empty house, possessed and enlarged by a stranger: whereinto therefore, Pictures do more easily fall, than into it being exactly shut. 3. The object of sight is more spiritual, and therefore its Image more naked, spirituall, and more active. A fourth reason is; the Father of Lights in this thing, doth by a similitude manifest, that in thinking only of the light, he created all things of nothing: I say, he brought forth the particular kinds of things into a created essence, which he from eternity comprehended in himself, onely by cogitation or thinking. So also the imagination of the lust of Souls, by the object of sight, poures forth its own Image into seeds, that so they might be fruitful from the command of God.

It might here be said, how may the apparitions of Spirits be made immediately in place, colour, figure, and light, but not in a Body; and by consequence, why may they be seen by one, and not by another that is nearer. By what way may Lights and Colours cut thorow each other

- other in place, the existence of every one being nevertheless unchanged; after what sort may they pierce each other, and deceive the Rules of the Optick Science: that is, how may a bewitching or charm be made: How may a Colour have a dark splendor, invifible in the middle or Mean, vifible in the repercuffing or re-bounding bound: although that brightnefs be no lefs in the mean, than in the faid bound or terme, nor in any beam; but in a direct one onely. But thefe things I leave to others, under the pofitions by me framed. I rather treat of naturall Science.
- 52 Modern Writers have diftinguifhed of qualities by their Ranks or Orders: to wit, that the firft might fhew forth the Elementary countenance of heat, cold, moifture and drynefs, (of which two latter I have demonftrated my judgement elfewhere:) But that the fecond qualities might contain light, heavy, foft, hard, rough, fmooth, bricke, tough, white, black: And likewife Odours, and Savours, as fweet, bitter, falt, fharp, breachy, foure; becaufe they think they are thofe which do moft nearly rebound from the mixture of the Elements: which is falfe, feeing the Elements were never mixed: therefore the aforefaid qualities do follow as it were the formall Beginnings of feeds, their own gifts, and have themfelves by way of a fermentall putrefaction by continuance: as appeares in the particular kindes of Mushromes. And then, the third qualities, they call fpecificall and formall ones, and they have as yet added to thofe, fourth qualities, as the more abftracted ones. Therefore the third quality is a fpecial aromaticall favour in Cinamon, Saffron, Cloves, &c. keeping every one to its own Species. The fourth therefore are more formall, and more remote from the Body; fuch as is a poyfonous quality in poyfons, a folutive one in laxative or loofening things, an attractive one of Iron in the Loadstone, a productive quality of milk in Fennel, &c. The three former forts at leaft, do operate corporeally by vertue of the feeds, as they have efpoufed the matter to themfelves: But the two latter are plainly formall ones, and do act by a lightfome, and an abftracted power tied faft to their compofed Body, and therefore they have a power to imprint their actions on vitall forms. Indeed the three former do fcarce pierce other Bodies, and much leffe are they co-mingled with them radically: And therefore they are tranfchanged by our Archeus; So that although they may as yet carry with them from their being tranfchanged, an obfcure property of their middle life; yet they are fubdued into our protection, and are made our Citizens: Although many things at the time of their tranfchanging, do remarkably difagree with the Archeus, becaufe they have an untamed valour, and other incapacities, I fay, dregs and impediments: To wit, they are incorporated in us with a mark of their own middle life, which they difficultly put off; yet are they fubdued: But if nor, they are rejected, after their own Contagion is left in us: And therefore they degenerate into dregs or filths, the occafions of Difeaſes: whereby the Archeus being divers wayes troubled; and wroth, doth afterwards form Difeaſes. But formall, and wholly abftracted properties do fpring out of the forms, and are lightfome, and therefore alfo being farks of the form it ſelf, have a force of piercing the Archeus throughout the whole light thereof, likewife the life, and forms of the parts.
- 53 Therefore I long agoe thought, whether the biting of a mad Dog might bring down a certain Signall phantafie which might convert ours being as it were its patient or fufferer, into it ſelf, and might form unto it ſelf a proper lightfome property, the effectrels of an Hydrophobia or a difeaſe wherein water is exceedingly feared; or whether our Archeus might frame a poyfonfome Image of his own proper accord? But at length, that difpute ſeemed to me to be onely about a name: Becaufe I found in thefe kinde of lightfome actions, a co-knitring of unity in a point, to wit, of the occaſionall caufe, and of our efficient Archeus; for that they do pierce each other after the manner of lights, and do radically unite without any other diftinction than that of relative termes.
- 54 That which is now judged concerning the outward poyſon of a mad Dog, let the ſame judgement be of a *Cancer*, and other things: For a formall poyſonfome light being budded in our life, is it ſelf living; and ſo, even as the Archeus being mad, doth fermentally receive an externall infection; ſo alio in a *Cancer*, he wandring, tranſplants himſelf into furies, whereby he locally troubleth or vexeth the fleſh: For whether they are carried inwards by an externall chance, or indeed be raifed up within, and ſo thus far, do in ſome ſort differ as to their principiative Beginning; yet in the mean time (notwithſtanding) it is the ſame, by application of the poyſonfome light, the manner of propagating and piercing being kept according to the properties of the feeds, and alfo, the Sphere of activity proper to every poyſon being kept: For ſome poyſons do ſuddenly propagate themſelves into the whole Body, and do ſtraightway bring on death; but others do exerciſe a locall poyſon, becaufe the property of theſe is, that although from the nature of poyſon, it pierceth; yet it enlargeth it ſelf onely according to the preſcription of its own poyſon. This is indeed an immediate acting of

of Forms into Forms, by the penetration of a fermentall uniting, with the transmutation of our Archeus. Therefore a new poyson is not properly stirred up in the Archeus, that it may form a poyson to it self: Even as otherwise elsewhere (as in a Fever) an occasional matter stirs up the Archeus into fury; not indeed to frame other occasionall Feverish matters; but naked Idea's of fury, to expell the addicted ones which he decyphers in the very substance of himself. But the formall lights of poysons do pierce the vitall light, by changing it efficiently and powerfully, by reason of the occasionall poyson implanted in them; being present, and radically piercing our middle life; and it disposeth it into the last life, by the first life of the poyson: For they are formall sparks, soulified, or not soulified, be it all as one: Because they do not act by a formall leave and liberty, whereby they pierce in a point, and insinuate in an instant: And they do act that which they are commanded by the Lord to act. And then, we must consider after what manner they so easily prostrate or destroy our life. 1. To wit, whether they do transchange ours into their own. 2. Or indeed do drive the Archeus into a fury, that being mad, he may destroy himself, and diffuse himself throughout the whole Body. 3. Or whether indeed they do mortifie by a depriving of light, to wit, by blowing out the light of our spark in the Archeus. 4. Or at length, do press together the Archeus under them by a poysonsome exaltation of themselves? First of all, it is certain, that this is not done by contrariety, the which is demonstrated elsewhere, never to have entered into nature. 2. It is certain, that it is done by gifts conferred by God on the poyson, which are called properties. 3. And it is certain, that poysons do divers wayes act into us, and that their differences have appointed a fourfold manner of poysons. 4. And at length it is certain, that God hath not created death, as neither poysons as the destruction of men, whom he endowed with immortality: notwithstanding, his integrity being corrupted, things became to him deadly, which before were not poysons unto him. In the mean time, some poysons are fermentall, which do not destroy us so much by the force of a lightsome spark; and by a formall property, as by a certain ferment almost odourable; and so one onely life doth on every side fear many enemies unto it: For such sort of ferments do more approach to the nature of Bodies. Thou seest that thing in a sulphurated Torch or Link, the which being lighted, and hung up in a Glassen Vessel, will burn indeed, and will fill the Vessel with the sublimed smoak of the Sulphur: the which, although thou shalt cause to expire, and again shalt put into the Vessel a burning Torch or Link, in the very moment that it entreth, it is extinguished: Not indeed, by the Sulphurous smoak (the which seeing it self is as yet Sulphur, ought rather to be enflamed) but by a wild Gas, the onely Odour whereof extinguisheth the new flame: not indeed by a materiall blast, but by its Odour: Yea, it not onely extinguisheth a sulphurated Torch, but also the flame of a Candle: and that is proved: Because if thou shalt send the flame into a spacious Hogs-head, so long as the Vessel casts the smell of a hoary putrefaction, or otherwise doth contain any small quantity of dregs putrified by continuance, it blowes out the flame of the Link or Candle. Understand thou therefore the same thing proportionably in vitall formall sparks: For so indeed in Vaults and Mines, men are easily killed by the Odours and Gas of the place. So also a pestilent poyson doth oft-times without delay, slay the vitall light: Because such kinde of poysons are positive, and blowing out, mortall, but not privative ones: For neither can they be endowed with any other Etymologie, than that they do efficiently blow out by their poysonsome Gas, the formall light, sensitive Soul or substantial Form of our life. And therefore they have place among reall Beings, and indeed among the most mighty or potent Beings.

CHAP. XXIII.

Nature is ignorant of contraries.

1. The brut Beasts were not in Paradise, that man might not see a brutall coupling, but that he might remain innocent of shame.
2. The brut Beasts were brought from elsewhere to our first Parent, in Eden, that he might name them, might thereby praise God, and acknowledge himself.
3. What kinde of Trees were there.
4. Many individuals were created in every particular kinde, but not in man.
5. Man alwayes ate fleshes, and of the Sacrifices themselves, besides the Turks, and Calvinists.
6. The first contemplative Philosophy of weeping Adam.
7. Tillage, the first of Arts.
8. Zoosophie or the wisdom of keeping living Creatures, the second.
9. Meteoricall Astrologie, the Chamber-maid of Tillage.
10. The entrance of Medicine was the last.
11. They stand as yet, in the first Principles. Galen hath brought in a Method too easie, and therefore suspected.
12. Galen hath feigned one onely naturall indication; to wit, by contraries.
13. The deceit of that Maxim is discovered.
14. Paracelsus being badly constant to himself, scoffed at Galen.
15. He badly judged, that all healing is made by like things.
16. That Seeds do not operate by contrariety; but by a Command known from a former cause to the onely Lord of things.
17. They know not which way the necessities of Seeds may be directed.
18. The blindness of Heathenisme is hidden in the Maxim of contrarieties.
19. The foolishness of Aristotle concerning the first matter, is noted.
20. The Argument out of Aristotle is retorted upon Galen.
21. Some Arguments concluding the same thing.
22. The Schooles are deceived by a metaphoricall, and hyperbolicall or excessive introduced nature.
23. That in the Elements contraries are not to be granted.
24. That the greatest cold doth peaceably combine with the greatest heat, in the same point of Air, and that without contrariety.
25. What a Relolleum is.
26. Water doth not wax hot by fire by reason of an introduced contrariety.
27. Water doth not quench fire by reason of contrariety.
28. It is proved from the Elements, that fire is not a substance.
29. Moysture and dryness are scarce qualities to be understood in the abstract.
30. Neither are they Relolleum's, after the manner of heat and cold.
31. That there is not a radicall co-mixture of moyst with dry.
32. One onely Question of the Authour propounded to all the Learned, who believe a temperature of the Elements in a mixt Body.
33. That the Elements are not contrary to each other.
34. That the Elements do not waste or consume each other.
35. That the Elements do not fight.
36. That things without life, have not contrariety.
37. It is proved from Faith, and then by some Arguments, that the action of nature is void of contrariety.
38. The same thing is shewen in other things.
39. What Nature may be.
40. The name of a Crisis is impertinent.
41. Paracelsus is noted, because he will have a remedy to work by reason of likeness.
42. In what the vertue of a Medicine may be seated.
43. Why hunger kills.
44. What things are required for healing.
45. The Doctrine of Paracelsus is refuted.
46. A foolish Objection.
47. Sin is not opposed

posed to virtue, simply, in a privative manner. 48. That the poison of a mad Dog, of Serpents, of a Bull, &c. have not at all a contrariety of causes, from whence they are made. 49. A Declaration of what went before.

I Having already sufficiently contemplated of the integrity of nature, afterwards, by little and little, I descended into the defects, and successive alterations of the same, while I reach or aim at Medicine: To wit, I have shewen that there are not four Elements in nature, and especially that the fire hath not the thingliness of an accident, yea neither of a substance, much lesse, the nature of an Element: Wherefore, the quaternary of Elements and Complexions being broken asunder and made void; therefore also the constrained knot of four humours. So that although from hence it be sufficiently manifest, that the causes and essence of Diseases have been untouched in the Schooles; yet I would elsewhere demonstrate that very thing from their own positions, in a peculiar Chapter. But in this place, I will demonstrate, that nature is ignorant of, and likewise, that she doth not admit of contraries in desire.

In the beginning, God created the Heaven and the Earth, and whatsoever is contained in the Universe. But he placed the man in Paradise, after he was created: For neither had he a Lion, Sheep, with him, or Tyger contrary to him, or Wolf his Companion: Nor lastly, any other Creature, which might lay in wait for him, or for the Fruits of Eden: Yea neither would the Almighty, that man should behold the brutish copulation of the Sexes, whom he wished to live in the purity of innocency (as elsewhere concerning long life.) But God brought even one at least of all living Creatures of every Species, to Adam, even from the remotest Coasts of the Earth (for truly the Ranging Creature remains not long alive but in his own Climate) that Adam might give them their proper names: But it was not of so great moment, to give a name to the brut Beasts, that God should without a further end, lay these before Adam for to name them.

But that was done, that he might know the knowledge of all things to be freely given him from God, and that the Judgement or Umpire of so great an heap, might constantly worship or adore in Spirit, for so many benefits: For from that whereby he named all Bruits according to the proper nature of every one, his own knowledge of himself was included; which is the top of Wisdom. For he had known himself to be wholly (not indeed himself to be a Bruit) not a disagreeable, and the immortall Image of the Divinity. Therefore the bruit Creatures were brought to him from every part, chiefly for the honour of God; and next for his own profit, that by an utter denyall or renouncing of the Bruits which he had not seen before, he might extract the knowledge of his own self, and so might depart from the mockeries of the Tempter. The Bruits might want Sir-names, when as especially they ought not to name each other; also it was not required for one to know another, or judge of the nighnes of their kin, by a name. Therefore, after their naming, all of them were again restored to their naturall places: For man wanted a bloody Banquet by slain living Creatures; but he bare the good pleasure of his Creator, in granting him the fruits of the Trees.

There then, every Tree did look fresh and green, with a perpetual leaf; did bear a successive flower: Lastly, a perpetual fruit, not wormy, nor falling before ripeness; as neither brought it forth a barren or untimely Flower. Such was the daily race or increase, pleasure, abundance and happy plentifulness in Paradise: For even as Herbs fit for meats, are to us for Corns, Pulses, Pot-herbs, and Spices; there the Trees also, did bring forth one of these, if not the four, or some of them connexed at once: For truly the manifold Acorn did there represent the divers Corns: Olives, and Nuts did note out as many Pulses; Even as the Apples also, so many Pot-herbs. The Trees also, the Mother of Spices, did present Herbs fit for Sawces. And last of all, many things stood connexed, under one onely particular kinde, even as now also, the Apple doth now and then consist of an Oily Kernel. Indeed, all things did flatter mans Senses. But after that the majesty of man became of no value, by reason of his departure from the right way or Fall, and his nature was now polluted, he ought to die the same day; and the vigour or force of the declared sentence had stood, unless he by whom all things were made, had impledged himself a Surety before him who made all things, that he would die for man in the fulness of times, that love might kisse his Justice: whence there was peace. Man is to be cast out of Paradise into the earth, where the more barren Trees offered themselves, nor those sufficient for the continual necessities of foods. But before that he was

driven away, when as now himself was ashamed of his own nakedness, God cloathed them both in Coats of skin. Indeed that great Priest and Lamb, was offered up an unspotted Sacrifice, from the beginning of his loving promise, who for a Mysterie, therefore sacrificed two Lambs, without spot to his eternall Father, before man: one indeed for the Burnt-offering of his future passion: Another also, without the breaking of its bones, to be partly sacrificed, and partly to be eaten, for a Peace-offering; he gave both to the Man and Woman, that from the foundation of the World, the Lamb might be one and the same, for a continuall Sacrifice, oblation, and food: with the Skins of which Lambs, our Parents were covered: Which first Tenor or right of sacrificing, Heathenisme afterwards imitated.

4 Although two Sexes onely of every particular kinde, entred as Companions into the Ark; yet the Lion fasted not for a year, that he might divide the first hope of the Flock together with the Leopard, and Wolf; and he had afterwards again abstained for a year: For the Lord replenished the Earth with a sufficient number, which before was empty and void: For neither would he have any thing to be wanting: Even as he enriched the Sea with a multitude of individualls, so also the Earth with a plurality of individual bruit Beasts: For although onely two living Creatures of a sort, entred voluntarily, yet *Noah* by the Command of God, took food for himself, and necessary foods for the other Creatures. Therefore it is a vain and foolish question; why at this day there are more Sheep than Wolves?

5 Man therefore had fleshies from the beginning, wherewith he might be fed, and might sacrifice; and the rite of sacrificing was even from the beginning of the World, that the Sacrificers might eat of the thing sacrificed. And at this day, onely the *Mahometans*, and *Calvinists* do fail, being as it were destitute of a Sacrifice. Let them therefore give place, who write, that mortall men before the Flood were not wont to eat flesh; because it was written, *Fleshies shall henceforward be like unto Pot-herbs*: For otherwise *Abel* had in vain led a Flock and Herds; neither had another been slain in the hunting of wilde Beasts, and *Nimrod* should have a vain name. Therefore I may believe, that Mortalls used as well tame as wild Beasts; yet scarce Fishes before the Flood: Because then, one onely Fountain did water the whole Earth, and the Sea stood on the other part of the Globe, whose other half was called dry Land: And so Fishes were onely of the Sea, while the whole World was an undivided Continent: in the middle or heart whereof, one onely Fountain being divided into four Rivers, did water the whole Earth: Therefore Cock-boats or Skiffs, had not as yet been made known: so fishing in the Sea, was unaccustomed. Neither also did the Habitation of men occupie the shoares: For one onely, and vast Continent of the Earth gave pleasures enough to the Husband-men, that they detested the barren Sea, made frightfull by a thousand Tempests. *Gen. chap. 1. v. 28.* It is read, that first of all, *the Dominion of the Sea was given to man, and then, over the Fowls of Heaven*; and thirdly, *over all living Creatures which move upon the Earth*: yet when as the speech is of meats, *Chap. 1. v. 29. Every Herb and Tree is given for meat.* And *Chap. 1. v. 30. All living Creatures of the Earth, and Birds of Heaven, and whatsoever is moved upon the Earth, having a living Soul, is given to men, that they might have that which they might eat*: Yet the Fishes are no where read to have been granted, as neither the Fishes of the Sea to have been brought over to *Adam*, that they might obtain their names. From which particulars, it is presently plain to be seen, that no Herbs, Trees, or any creeping things, were contrary to man, or for a Medicine of destruction unto him. Likewise the restriction, for Birds, and what things do move themselves upon the Earth, doth exclude the Fishes. Wherefore, as soon as after the Flood, by the dividing of the one Continent, the Springs and Flood-gates diffused themselves from the lowest bottom, Fishes being allured by the sweetness of the down-sliding waters, some remained in Rivers, and Fens: others in the mean time through a new thorough-mingling, and liberty of the Flood, ascending out of the Sea: Therefore let Fishes be fleshies, although before, not used by man: *Fleshies* I say which after the Flood should be like unto Pot-herbs: otherwise, the flesh of flying Fowls, did not repay or supply the Rooms of Pot-herbs; but Corns, as four-footed Beasts, had now long since from the beginning, supplied the place of pulses.

6 Therefore our first Parent being banished into the Earth, and being full of miseries, weariness, and repentance, through the leaseure of most ample Ages, perceived his nature now to be defiled with corruption, and wanting preservation. Lastly, as necessity is the Mother of Wits and Inventions, he began to meditate, by what reason or meanes he might prevent the inward Calamities of life, and especially the injuries of a Meteor. In which labour, the eldest of his Sons began thorowly to weigh the Nativities of fruits, their prosperous, and unfortunate increases.

7

whence Agriculture or Tillage was the first Philosophy. The other Son also, noted the properties and Societies of living Creatures; whence by the undoubted hope of a Flock, a quiet life is led: This indeed, was *Zoosophie* or the wisdom of keeping living Creatures together.

But their successors making afterwards, a more plentiful progress, joyning the decrees of the Stars with the observations of their Predecessors, observed the denounced successive changes of things, with a profitable, and pleasant observation.

Therefore Astrologie, the Chambermaid of Tillage thus arose. Notwithstanding, the dispensations of naturall things have remained altogether obscure; even as also, among all men, the knowledge of ones self is the last and hardest of all things. But the generations or births of Diseases, their Remedies and Curings (which as yet then were most rare or seldom) were far more obscure: For at first, every one brought the Remedies which had profited him, into open view, without envy: But *Hypocrates* first laid up his Observations into a written style or method: in which labour, he felt the divine assistance, which he had not known: But *Galen* (as it were the North winde) having seemed to himself to have dispersed the vain Clouds of desires, & having filched many things from every place, boasted that he had raised up the Speculations of the Elements, first qualities, Complexions, and humours: And dedicated all the works, and fortunes, as well of sound, as invalid nature, to these: which things afterwards, the Greek Nation plentifully increased: By which suppositions, the *Moors* striving for the Victory, built loose experiments upon them.

This therefore was the Originall, and condition of bringing forth Medicine; and these were its inventers. At length, in these it was at a stand, neither afterwards made it a progress. *Galen* being instructed by his Elders, observing that fire was quenched by water, and that water being heated by fire, did vanish away, supposing that he held the Hare by the Eares, boldly constituted almost all Diseases, and their Remedies in those first Bodies, and their qualities: For he said, *The fire was at enmity with the water, and this with it*: whence he established it by a generall decree, that there is in us the combate of four Elements, fighting in us by a continuall Warre: And that there doth skirmish in us a continuall and unexcusable strife of contraries: Wherefore, although nothing should weary us from without, yet it would come to passe, that sometimes a distemper, or Disease, and ruine should happen of their own accord: That death I say, should break out of the composition of the Elements. This indeed was to be winked at in *Galen*: But not in Christians, if they do not teach, that in *Adam*, there was a like necessity of composition before, as there was after sin: To wit, if the composition of *Adam*, stood connexed unto four encountering Elements: Therefore all the Schooles do determine, that onely contraries should be the remedies of contraries: To wit, whereby every excess (being notably marked with the name of a Disease) might be reduced into a mediocrity or mean. That plausible and stupid Doctrine easily pleased all that were inclined to a sluggishness of subscribing: Because it was that which might easily be conceived by a rustickall sense, a great compendium, and in all places by any one; and, hence therefore it was most greedily drunk in. *Galen* (the while) although he knew that cutting off or resection was privately opposite to a Being that is born, yet he doubted not to reduce the withdrawing of parts, or humours, in respect of the members, unto the order of contraries: And he neglected the Family of privations, as born by an adulterous congress: Hence all things universally, which should disagree in number, situation, magnitude, proportion, afflux, or efflux, he took from their due order, as though they were contraries, that he might make an establishment of his own foolish Rule: As if Medicine did not work naturally, but stood by learning by demonstration alone.

Hence at length, by a most generall absurdity, he dictated the naturall indications or betokenings of Diseases, to be made onely by the oppositions of contraries: For he would have necessities to be subservient to his own Maxims; but he erected not Maxims conformable to necessities: which fictions therefore are commanded to work ruine, as many of them as are handed forth at the pleasure of so great ignorance: Therefore that Maxim hitherto remains adored by the Schooles, and common people, (as it were the top of healing) which by contrarieties, that is, by brawlings, strifes, Wars, fighting, and *Crises* or judicial periods, do mark out the beaten path of healing: For it hath so been credited; so wrote, and feigned hitherto, and that, so without controversie; that nothing is thought to be alike plausible, and fit for subscribing, and doth through its own facility of understanding deceive, by delighting, and captivating every unwary person.

But the knowledge of the Causes and Roots of healing, do grow from a far more hidden stock, than that the vulgar by a rustickall perceivance can crop the flowers of the same: Neither hath *Galen* considered, that one contrary ought so often to be predicated of (according to

Aristotle) as oft as another, because both of them stood under the same generall kinde, and did rejoyce in an equall priviledge: wherefore neither hath he at any time diligently searched, what that generall kinde should be, under which, positive coldness, or cold, might stand contrary to so manifold a putrified heat as he feigned particular kindes of Fevers: To wit, where he might finde cold contrary to a Malignant, putrified, and hestick or habituall heat; And resisting heat in so many excesses of spaces: Or what might be that singular and individuall action of cold, of so diverse Degrees and Species, whereby as many heats being brought under the yoke, they should be compelled to a due proportion: which thing surely, so long as it hath been neglected by the *Galenists*; also a just remedy for every Fever hath remained unknown, and Remedies have been administred, being prescribed by guess and chance: For through *Galenical* scantinesses, they on both sides prostrate their lies, conspiring for the death of mortalls.

14 *Paracelsus* indeed scoffed at *Galen* with an Helvetian taunt, although as being constrained, he now and then runs back to the same method, being unmindfull of his own continuall chiding: For oft-times he would have contraries to be coagulated in things resolved, and resolving: yea, many times, he uncompelled, runs back to hissed-out elementary distemperatures: at length through a heat of contradicting, he constituted the healing of all diseases in the likeness, as well of nature, as of the causes making Diseases, with the remedy it self, being indeed every where, full of indistinction.

15 But I under a Philosophicall liberty, being addicted to no Master, do perceive that if by the taking away of the causes, all co-knitting of affects is thereby cut off; that every healing of Diseases ought also to be defined by the same law of Causes: So that a correcting, withdrawing, and extinguishing of the immediate efficient cause (which doe suitably enclose within themselves a privation of the effect following from thence) should contain the chiefest substance in healing: But not the likenesses, as neither the contrarieties of Remedies. In the first place, the products of Diseases (suppose the Stone) as they retain in themselves their own Agent co-agulated in them; So also, they are very often cured by taking away of the effect onely: Because, sometimes the co-knitting of the inward cause, or of the immediate efficient is taken away, together with their matter. Add to these things, that onely a solution of the co-knitting of the efficient cause to the matter; and so a strained, or loosened fitting, and quenching and appeasing of a privative disturbance in the *Archens* (which do sometimes include in them a meer privation) do oft-times compleat the History of healing, without any contrariety, or likeness of the Remedy to occasionall causes: which very thing *Paracelsus* ought to have remembred, if he had once looked back unto his own *Arcanums* or secrets: For he had soon taken notice, that any one of those *Arcanums* do of right chase away almost all Diseases, without any respect to likenesses, or contrariety; but through the besprinkling of a virall tincture alone, by a secret gift, that is, by an over-flowing of goodness: For indeed, whatsoever is made or born in nature, is made from the necessity of efficient seeds:

16 But seeds themselves do in no wise operate for the scope of likenesses, or contrariety (as otherwise is commonly thought) but onely because they are so commanded to operate by the Lord of things, who alone hath given knowledges, bounds or ends to seeds, known to himself alone from a former cause: Else seeds do wander, and whither, they know not: And indeed, they direct themselves as though they were strong in knowledge; but they tend by the means granted unto them, unto ends unknown to themselves: For we do improperly call them the intentions of Medicines, or scopes of nature: not that they have prefixed an aim to themselves, from the beginning, as if they were potent in a minde and fore-knowledge: but because by a created gift, they are born to flow down voluntarily and naturally by their own direction, unto such limits as are known to God: For Christian Philosophy doth thus dictate this thing; but the Heathenish Schoole is ignorant of it.

17 Therefore even in the light, I do admire at the boldness of the Schooles, which have not acknowledged the seminall Beings of nature in Diseases; and have placed qualities in the room of Beings subsisting by themselves, and that Disease ones: nevertheless, they would have them to be esteemed after the manner of will or judgement, of feelings, and animosity, as they should possess Antipathies and contrarieties by their own proper force. Truly, I have thus accustomed my self to play the Philosopher, as I covered to mete out things themselves by a radicall foundation, according to the Whet-stone of sacred truth, as near as might be lawfull for humane wits. Therefore, that I may shew the positions of Contrariety to contain meer incongruities in nature, it is first of all to be observed, that they have suffered the frivolous invention of *Aristotle* to prostitute a matter wholly deprived of every accident, for the subject of generation, as well in a sound nature, as in a corrupt one (to wit, in the grief

18 of

19

of a ifeafe) for he thus prosperously beginneth from a twofold, and every way privation of accidents, and forms, for the original Beginning of things) Therefore that every accident as well inbred, as suddenly hapning, doth alfo consequently depend, and iflue out of the bofome of forms.

So indeed, that from the Forme, and its firft Effay, all activity in the Archeus, as well of matter as accidents, doth neceffarily depend: in the mean time, the Schools were thorow taught by this *Aristotle* (they fupport it even to this day) *That nothing can be contrary to Subftances, as well thofe material, as formall*: I do not fee therefore whence accidents fhall beg their own contrariety to themfelves, efpecially thofe which are the naked, immediate, and meer instruments of their own forms? For from whence had they drawn their own contrariety, whose matter, and form (indeed the total principles of accidents) do repulle all contrariety far from them: efpecially, becaufe accidents being confidered in themfelves, are not fo much [Beings] as [of Beings]; and fo that of themfelves they are nothings, do work or prevail nothing: Therefore it muft needs be, that if there be any intention of contrariety in nature, that is primarily in the active Principle, that is in the bofom of the forms: So that even in this refpect, forms themfelves (the which notwithstanding without controverfie, they have banifhed into the number of fubftances) fhould be actually, and potentially contrary by a primitive right. Consequently alfo the Maxim of the Schools is falfe, *That nothing is contrary to fubftances, or it behoveth accidents to have the fame contrariety, not depending on forms, and from their own proper nature, without, and againft the poffibility of forms*: That is, not to be the immediate means, products, and instruments of forms; but to arife, ftand, perfevere, and act of themfelves, even againft the will of forms, without, and beftdes forms; To be I fay, independent Beings, and no longer [of Beings]: Or Thirdly, At length they muft confefle with me, That there is no contrariety in nature, except among free and elective Agents. I adde, If the equality of contraries fublifteth according to the aforefaid Maxim, it muft needs be, that the relation of a relation to be founded between contraries, depends on a fubftantial root, or on a radical refpect of contrarieties, and an intimate fuitablenefs of proportion moft fully prefent; which is as much as to fay, *That the effence of the relation of contrarieties to be founded (otherwife more former than the exiftence it felfe of forms can be) is altogether feated in the moft full, or innermoft fubftantial principle of forms it felf, wholly incapable of contrariety*: And that, whether thou doft refpect God himfelf, or any other created fubftance: and fo it muft needs be, That contrariety in nature doth include a contradiction in its own Beginnings, and thofe of Phylofophy. But if thou confidereft thefe things even as fupernaturally, and in God, they are not alfo therefore made contrary; and fo, neither fhall they flow from God into nature, as contraries. And this very thing I fay, I alfo urge further, If one contrary may be declared fo many wayes, as oft as alfo another; Neither is there any thing contrary to fubftantial forms; therefore there is alfo no friendship, co-refemblance or likenefle between forms, which is falfe: For truly, from hence doth appear a Character of things not to be blotted out, becaufe all things were created by God the Lover of Peace. For after that I fubmitted my felf to be instructed by better Beginnings, I ferioufly knew for certainty, whether I fhould behold fubftances, or at length accidents, that there is no contrariety in nature, unlefs among angryable or wrathful Beings, and moveable living creatures: So far is it, that the action of every Agent on its Patient, fhould onely proceed from the term of relation of a contrary unto its contrary. Therefore I have found contrariety only in the wrathful power of Sensitive creatures, and not elfe-where: Whence perhaps by an improper metaphor, or hyperbole or exceffivenefs, contrariety hath been alfo wrefted unto all individuals of the world. Whether the Schooles feeling a proper animofity of difputing, have alfo meditated that the other products of Seeds alfo, are in like manner furred up only by anger; to wit, by the action of the greater to the leffe, of the Conqueror to the thing conquered, and of the Stronger to the weaker, by Reason of the Relations of Contrariety: Therefore the fenfe of that Negative Maxim, wherein it is faid, *That nothing is contrary to fubftances*; is equivalent to the Pofition fore-placed in the Title of this Chapter: to wit, *That nature is ignorant of or knows no contraries*. If there fhould be any power of contrariety in nature, except in the wrathful faculty of fensitive creatures (for of Terms, and applyed Relations of Logick, I do not fpeak) furely that fhould be in the manifft and primary qualities of the Elements; but in thefe there is no contrariety; therefore in no place elfewhere.

The Affumption is proved, for that the Schools do draw the firft qualities in mixt bodyes from the very contrarieties of the compofing Elements: But the Subfumption I have proved elfewhere, here to be repeated: *A young man in the morning defcending from the Alpes, which are covered with continuall Snow, yet on the fide refpecting the Sun, his whole neck was burnt into Bubbles or Bladders*: And there the aire is exceeding delightfull, and poured all abroad

abroad, as it were with a new sky : (Learn thou thence in the mean time, first of all, That Cold is not a privative absence of Heat, but a true Being) Therefore Cold and Heat being there heighned at once in the same place, time, and subject of the aire, do mutually suffer each other ; which thing, the Schools will not admit to be possible in contraries : for truly, they are such things which they will have mutually to beat down, break, expell, slay each other, and to bring to a middle and neutral state. We must note here by the way, that in the same place the heighned cold is entertained immediately in the aire ; but the heighned, and bladdering heat to be there in respect of the Light, and so immediately in the place it selfe of the aire, but mediately in the aire : But seeing that place doth pierce the aire throughout its whole substance, and the enlightned place doth heat also the aire it self, which therefore the light doth at once pierce ; therefore in the same point of the aire, there is a heighned heat, together with heighned cold : The knitting of both which, brings forth an acceptable, and friendly luke-warmth to the sense ; yet a mocking one, because the effect of both qualities being knit together, bewrayeth a great heighning or degree under that luke-warmth : And therefore neither is luke-warmth caused as both qualities being equally heighned, do dash or batter each other through the fight of contrariety, and reduce each other into a middle, and plausible mediocrity ; but the Senses, and Schools (which according to sensualities, suffer themselves to slide, every where, without a more inward narrow search) are too improper, and rutticall Judges of natural things. Likewise hot water being powred into cold, of a like proportion, although they do presently stir up a luke-warmth in the thing co-mixt ; Yet both qualities in a heighned degree, are in that luke-warmth, no otherwise than as in the aforesaid aire of the *Alpes*, although the sense doth not distinguish them : For otherwise it is not possible, that that heat of the water gotten by the moment of degrees, should perish in an instant ; yea, neither is it the fight of contraries, which hath presently generated that luke-warmth, as neither the victory of cold excelling the heat, while the former heat is slackned ; but the heat in the water is a transitory *Relolleum*, because it is violently brought in : For therefore, the fire ceasing from which it was produced, of its own accord, it presently is diminished, and ceaseth, being no longer cherished : That the heat in the hot water being divided throughout the least Atomes of its subject, perisheth of its own accord, but is not overcome expulively by a contrariety.

25 Because a *Relolleum* is an efficient quality, not proceeding out of the Ferments and Seeds of things : And it is twofold ; to wit, One in its own body, but the other in a strange body. Amongst proper *Relolleum's*, some are seperable, As cold in the air and water ; but others are unseperable, as heat in the light of the Sun, Candle, and Fire, which can never wax cold : A strange *Relolleum* is violent, by which, if it be not nourished, it therefore perisheth by its moments and degrees : And therefore it is called transient, as is heat in the water. Therefore aire, and water are not made hot by the fire, through contrariety, but by the generating of a strange *Relolleum*, as it acteth that which was commanded it to act, after a different manner of acting with seeds.

26 And therefore, it neither acteth to, or for a form. In like manner, when water extinguisheth fire, or fire lifts up water into a vapour, that never happens by the force of contrariety : Because the whole fire of the universe cannot blot out, or lessen the least moistness from one only drop of water : Wherefore, the contrariety of the fire should be in vain and foolish, or its fight vain and invalide : But that aire cannot in any ages, by Art or Nature, be converted into water, or this likewise into aire, as I have elsewhere demonstrated by Science Mathematical, and by other means sufficiently enough demonstrated : For neither is the fire quenched by the water, by reason of the presence of a contrary cold in the water : For so hot water should not quench fire : And fire burnis more strongly under the blowing and cold of the North, than of the South ; and the coldest blowing of Bellows doth the more kindle or enflame the fire : Therefore water slayeth fire, but not fire, water : Also fire gives place, not being overcome by cold, but being choaked it perisheth : And so hot Oyl doth extinguish a bright burning Coale.

27 If therefore contraries ought to be under the same generall kind, fire cannot be contrary to water ; seeing fire is not a Substance ; even as I have sufficiently demonstrated elsewhere.

28 Lastly, If they were contrary, they should be primarily, by themselves substantially, and immediately contrary, as simple bodies ; and that being granted, their action ought to be a like and equall fight, which thing I have already before shewn to be false, even as also that nothing is contrary to substances : For by the beholding of which two things, to wit, The fire, and the water, the Schools have feigned every contrariety of Mixtures and Complexions in the Universe : What wonder is it therefore that the contrariety of nature dreamed of in the Schools, is now to be had in suspicion ? Seeing their own privative contraries are without

without contrariety, likeness or equality, combat, co-mixture, and grappling of forces?

Furthermore, moisture, and dryness are qualities scarce to be understood in the abstract (even as otherwise, heat is considered in the hand, besides or without the fire: yea in its improper subject, as is the water) but moistness, and dryness are rather very Bodies themselves qualitated or endowed with qualities: Neither therefore are they attained by parts and degrees (with the leave of the Schooles) after the manner of qualities: For moistness is not properly produced, but a moist Body being added to a dry one, more of the moist Body is applyed, and so moistness improperly waxeth great: That is, moisture increaseth quantitatively, but not qualitatively: But water doth never wax dry, although it may deceive the eyes by vanishing away: Even as concerning Gas elsewhere. Again, *Siccum* or Dry soundeth properly, *ex-succum* or without juyce, and contains onely a denyall of moisture: But although through the admixture of dry, water may seem to be diminished in Clay, yet the water doth alwayes keep its own intrinsecall moisture: As also the dry Body keeps likewise its own dryness; Because there is not a piercing co-mixture of those in the Root, but onely an applying of parts: Therefore moisture, and dryth are so tied to a Body, that they can in no wise be distinguished from it.

And therefore they are not *Relolleum's*, in manner of heat, and cold, which are brought in by degrees. The whole water indeed vanisheth away into a vapour: yet it never assumeth even the least quantity of dryth: But if of meal and water, pulse or bread be made, and at length, the nature of a fermentall seed being conceived, they do passe into a Stone; yet truly those things are coagulated ones, which do cover and vail the ancient moistness of the water; but at length, the ancient water is fetched again from thence: For it was not dried up, nor hath it perished, although it were coagulated by the seed of things: For I have demonstrated elsewhere, mechanically, and mathematically, that all solid Bodies are onely of water, nor that they do admit of the congress or concourse of the other Elements: Or that every tangible Body is at length resolved into a simple Elementary water, such as falleth down through Rain; yea, being of equall weight with its former solid Body: which onely head, destroyeth the compact, temperature of the Elements, and the intestine, and uncessant Warr of qualities in us: wherefore it behoves the Schooles diligently to search for altogether other causes of Diseases; which I have declared by the unheard of beginnings of naturall Philosophy: Therefore it is a part of blockishness to be admired at, to have dreamed that moisture cometh to a thing by degrees, and likewise, that moisture, and dryness are slackened in the Elements: And so that it is a huge fiction, to have introduced these stupid Dreams into the Families of Diseases, and Cures, and confidently to have built upon these, the whole foundation of healing: So that throughout the whole ranks of moistures, and dryths, they have married each other, as well by their mutuall kinne, as by the bawderies of heat, and cold: To wit, for one onely fault, that their Neighbours might mournfully deliver their substance unto their vanities of temperaments.

Being altogether ignorant, that there is no piercing of moist with dry, in nature, no radical union, co-mixture, or radical temperature, whereby they may divide between each other in the bosom of a Form.

And I do propose one question at least, to all, by me resolved elsewhere, how many contrary Elements soever they hitherto suppose to conflux into the constitution of Bodies which are believed to be mixt. Since indeed they suppose two weighty ones, to wit, the water and Earth, and two light ones: And likewise do suppose a penetration of Bodies to be impossible in nature. Thirdly, also seeing they suppose, that Gold without controversie is a Body mixt from a reall Wedlock of the aforetaid Elements; how can it come to passe, that Gold doth exceed water in weight, sixteen times at least? For if there be in Gold, parts of Air and fire, mixt by an undissolvable, and equall tempering: (for that thing they affirm to be altogether necessary, seeing they assign the perpetuall remaining of Gold in the greatest torture of the fire, to be from an equall mixture of the four Elements.) Therefore Water and Earth in Gold being constituted, shall two and thirty times out-weigh their own matter, from whence the Gold ariseth: Shall therefore Earth pierce it self two and thirty times at least, while Gold is made of it? Therefore seeing the weight it self doth bewray infallibly, a ponderous Body, neither doth weight wholly consist of nothing; they must resolve me of this question, before they shall draw me to their own opinion concerning the mixtures of the Elements. In the mean time, there shall be room for me to shew by way of Handicraft-operation, that solid, and ponderous or weighty Bodies, do afford out of them, water of an equall weight, deprived of all manner of taste: Neither that an Element in nature is, as neither that the Elements can ever by any skill, or endeavour of nature, be knit together into a formall unity:

33 unity: these things already, more largely above. Therefore it is a deaf kinde of Doctrine, that there are four contrary Elements, which flow together to the co-mixture of other Bodies (which hitherto are deceitfully supposed to be mixt) and that they fight also in such mixt Bodies wherein they are enclosed, no otherwise than as in their own simplicity, by reason of contrarieties; and that therefore they do mutually slay each other by an uncessant War, and that they do as oft rise again immediately by privation, that they devour, and again vomit up each other.

34 That stupidity of the Schooles is not to be borne, whereby they do without scruple, subscribe to each other in these trifles, not enquiring, what that appetite in an Element of enlarging it self should be? or what the motion beyond the bound once appointed for it by the Creator? For first of all, there is not any hunger, thirst, penury, or any the like defective thing, to which they should be subject, from their Creation: Neither also, do they suffer defects, much lesse an actuall feeling of defects; Seeing every one is in it self a first and simple Being, neither doth it admit of VVedlocks, neither is it wasted by nourishments, and through the exchange of it self hath it, or doth it cast out excrements, nor doth it suffer rust; neither doth it by waxing weary or declining, degenerate into any Body more pure than it self, more former than it self, more simple than it self. Therefore a necessity is wanting, whereby the Elements may consume each other after a hostile manner: For God saw, that whatsoever things he had made, were good. If therefore two good things should fight against each other; that fight at least, could not but be a great and continuall evill, the authour whereof should be the Creator himself: For from thence it would follow, that such a property of the Elements should not be from God, as neither from sin, therefore, from some greater than God is: But if the Elements are said to be so created by God, that one should continually change another into its own nature; not indeed by reason of mutuall Hostility, but for the necessity of nourishment: Although, that presupposeth a ridiculous thing; yet I have what I wished: to wit, the taking away of contraries: Therefore, it is a vain privy shift, and a false devise: For truly, that supposition cannot subsist together with the position it self: For that excuse being supposed, it must needs be, that there should be a fight and resistance: Else, one Element should presently convert all the other that co-roucheth with it, into it self: Because there is no difficulty of overcoming, where there is no necessity of fight or resistance; Because every part of an Element should have the same passion, motion, and desire to consume its Neighbour, such things as are supposed to be in parts akinne to themselves. And so that therefore, those activities should be heightened into a hugeness, that it should easily and presently convert the Element subjected unto it, into its own nature, without a re-acting: And these being thus converted, afterwards uncessantly others, and successively others: At leastwise, that uppermost Air, and that which is at the farthest remote distance from the water, being pressed with a most tiresome and long thirst, had long agoe perished, or at least should languish through wearisomeness or grief, as being deprived of its naturall nourishment. Therefore, however these things may be excused, the Creatures at least, should be ordained by God, with a desire of troubling the order and Harmony of the Universe, and of their first constitution: to wit, of bringing in the first dissolution, and disproportion, by overcoming, slaying, and transchanging their Neighbour into themselves: Truly, humane frailties are the inventers of these fables, brought in by the Paganish Schooles.

36 Because through ignorance of nature it self, the common people have brought in Lawes, confusions, contrarieties, fights, hostilities, reducements, and repeated Resurrections, that men might excuse their own angry contrariety, and might apply it to things that want it. Indeed the Schooles, and also the common people, who have been deceitfully, thorowly instructed by these, have esteemed, that in nature it is a greater, more glorious, and better thing to overcome, than to be overcome; to subdue equals, than to be subdued: But God hath taught us otherwise: To wit, that in the top of perfection of nature, it is more glorious to suffer, than to do wrong: that it is a more blessed thing to be overcome of a stronger, than to have cast down a weaker. And seeing God cannot erre in his judgements, hence the judgements of the Schooles and common people, have sprung, not from the truth of nature; but indeed from our animosity and frailty: And therefore they are erroneous and abusive, as as being opposite to the divine judgements: Neither also, shall those which God hath despised in man, be able to praise him in the simplicity of a Law, and necessity of Nature, if they were glorious: But if there were any true contrariety in things that want sense, they had rightly judged, that that doth necessarily arise, and presuppose a conception of hatred and hostility, being radically sealed in their own first and formall beginnings; by reason whereof, the Agent from its own self-love, should stir up to it self a hatred against the Patient: or it should have that hatred singularly put into it by nature, for resistance, unlikeness, and an endeavour

deavour of successive alteration : And that, which way soever it may be taken, is to confess Radical, Seminal, and most inward contrarieties in substantial forms : And so substances themselves to be immediately contrary to each other, unlesse they had rather deny forms to be substances.

But I am provided to teach, That nature doth act all things by its own middle properties, no aime of contrariety, hatred, or fight being proposed to it selfe. 37

For truly, in the first place ; We believe it by faith to be true, That God is the daily Authour and Governour of Nature ; and that every where his own creature doth as much as it can, expresse and witness him in goodnesse.

In the next place, That God is the fountainous Beginning of love, concord, and peace ; also that he hateth discords and contrarieties, so that if he could have framed the Universe without brawlings and contrarieties, there is no doubt but he hath done it : But he could do that very thing most readily, because he is Almighty, and hath made all things as he would ; therefore also hath he done it. The Subsumption is plain, because nothing could resist him, but what he would make free : but the Seeds of things, or the Agents of nature, he hath not endowed with a freedom of willing ; therefore neither could the Agents of nature resist God : And by consequence, he made the Agents of nature, according to the good pleasure of his own love, goodnesse, and peace : For so, when I take meat, I never find in my self a contrariety, as neither in the meats ; but if its abundance or quality shall offend me, I find indeed a defect in me, but not a contrariety : If any one be averse to Cheefe, it argueth not a contrariety, but a seminal disposition working some hurtfull thing, through a seminal power directed by God : For it lifteth not us by reason of the necessary successive changes in things, to call any hurtfull qualities the hostilities & enmities of things : Because we must speak properly in Phylosophy ; whereas otherwise, words do change the sense, and do estrange the Essences of things, and especially, when as thereby the whole constitution of healing is wrested aside to the destruction of man : For contrariety doth not only bespatter the face of nature with as many vices as there are Agents, and Properties of things ; but also seemeth to have accused the Parent of nature himself, as if he were the Maker and Favourer of hatred and brawlings : And so that the whole universe should be only an Inne of hostility, a perpetuall Duel, and a true infernal Fury, no where expressing the Figure of its Creator. Therefore contrarieties more in those things which himself hath framed, according to the example of the Arch-type or first pattern.

Again, The creature, seeing it came out of nothing, bears before it no Property from it self : But if therefore, contrarieties should proceed from error alone, from the accustomedness of Seeds being wrested aside ; then at least they should not subsist, but in monstrous effects, and therefore should be thrust rashly into the composure of nature.

And Lastly, From hence it followes, That the contrarieties of Seeds are only from God : of which Assertion, a Christian judgeth the folly. For the Schools have never hitherto thoroughly weighed, how much these might differ from each other ; to have done any thing through a conception of contrariety, and to have wrought any thing through the obedience of the Seeds due to the Properties given them by God : For therefore, to admit of contraries, is to place errors in the intention, means, and end of nature. Therefore we must know, That nature doth altogether refuse contraries, if we hope to attain its in-most tone or highest strain. But that which the Schools have devised concerning radical heat, at least they have forgotten, *That radical cold doth marry it under the same vitall principle, That contraries might rejoyce in their own equall right :* And they have opposed death only unto it, out of the general kind : Wherefore, they have left that principal quality single without a contrary : And leaving their own false Maxim, *That contraries are under the same general kinde, and that they are predicated by as many equal turns on both sides.* For seeing death is a privation and non-Being, it can never supply the place of a contrary (according to the dictate of the Schools) *That it may be opposed to life or radical heat ; seeing that which is not, and which is nothing, doth not stand under the same generall kinde with radical heat :* Concerning the Fables whereof, and the fictions of Primogenial or Radical moisture, I have treated very largely in the Treatise of Long Life.

Again, The Schools being dashed against the Rocks, do now and then treat of heat, and cold, as potential things, yet not as contraries ; because in every small drop, or the least atome of Simples, they determine heat and cold to be connexed, and very excelling in strength : to wit, They declare in *Opium*, a heightened cold to be, and also a heat in its bitterness : And so also, I have now rendred their knowledge drawn from savours, ridiculous, from one only example touching *Relolleum's* : Because Seminal and Specificall Powers have by the

Schools been rashly brought over into Elementary qualities, or *Relollem's*: For they Divine cold to be in *Opium*, although bewrayed by no judgement of the senses, from its effects; because they by a ridiculous dream, have tied up the seminall, sleepifying power unto cold: As though the most High, when he would send sleep into *Adam*, had stirred up cold in him! And as if, after Dinner a notable cold in us should ascend into the head! Truly, the Schools do every way require an understanding for the obedience of an incomprehensible faith. But if the Herb *Flammula*, or *Scarwort*, although it hath it self after an univocal or simple manner (as much as in it layes) unto all things whereunto it is applyed; yet it doth not embladder a dead carkasse, even as it doth a living body: Because a dead carkasse is not moved actively, or by its own motion, by the poysonfom ferment of the *Flammula*: Because those potential qualities are no more those of heat and cold, than the Elementary ones are; But the proper and formall specificall efficacy of things. Wherefore the device and testimony of rudeness or ignorance for contrariety, is vain or foolish; whatsoever hath been by the Schools subscribed to the desires of the *Gentiles* concerning heat, and cold potential; Seeing they deny potential heat to be the companion of actual heat under the same kinde, under which notwithstanding they do collect contraries: And so, the rash history of temperaments hath drawn to it the vital and seminal faculties of things; for it is unknown in the Schools, that whatever acteth by reason of Salts, is not of the proper power of the Seed, but an accident varying by reason of the object: For they have esteemed Lime as a most hot Simple, because by its Salts, it moved an escharre or crust in a wound: Neither minded they, that in *Calx vive*, even as in Snow, worms do of their own accord arise: What is desired in this place, I have elsewhere more largely explained concerning actions, even as also touching the knowings of diseases.

38 Therefore hitherto I have taught, *That qualities are, and do operate in the Elements without respect to contrariety*: But now I descend unto a Systeme or collection of things.

First of all, Oneness or a Unite is not contrary to a Binary or that which is twofold, although they go back divided by interchangeable courses: Likewise, neither are upwards and downwards, East and West, contraries, but oppositions of Scituations, which do vary through respects: And so, that which is above, in respect of another thing, is beneath: neither therefore is the right eare contrary to the left, although opposite: For neither do I speak of contradictory terms, which do only contradict in a Relative respect, but have not hostile Properties in things: Neither also is my speech concerning privative things: Yea, neither do I deny contraries in the wrathfull power; but I constantly affirm onely this one thing alone, That God hath not made contraries in nature, which by hostility may kill and set upon each other: Or, I deny contrary properties in natural things; That is, I deny positive and reall contraries to be in the order of natural actions: For vertue hath it selfe opposite to vice, from the disposition of the thing depriving: Neither also is a flying creature contrary to a creeping one, for the same Silk-worm is both: Neither is generation it self contrary to corruption; but there is one only flowing of the Seeds, from point to point, by wearying, withdrawing, losing, or extinguishing the strength or faculties. Likewise, neither is great contrary too little, nor straight too crooked; Seeing one and the same thing may sometimes be small, sometimes great, strait, and crooked. Let the same judgement be of sweet and bitter, hard and soft, rough and smooth, heavy and light, sharp and blunt, coagulated and resolved, or of white and black: For all the powers of things are in themselves absolute; neither do they respect others that are diverse from them; Because every thing is even as it existeth by it selfe: But for that they are opposed by us, even as if they did disagree among themselves, that is unknown to things, and plainly by accident, or foreign unto them. In the mean time, a Hatcher doth not cut wood, or a Knife cut bread, by reason of contraries or hostilities, but every property acteth without reflexion on an opposite one, that which it is commanded to act. It is a foolish thing to will things to be contrary, wherein there is no pretence of hatred, disagreement, victory, or superiority: And therefore, neither is there any intention of contrariety in nature. Therefore every thing acteth even as it is commanded to act. For within an egg-shell, a war of contrariety is not inclosed, although the Seed may flow through various successive alterations of dispositions, far unlike from each other; a Unity and concord of nature is on every side kept, which is no where contrary to it self: yea, it abhorreth every contrary, and whatsoever disturbeth unity. For indeed, there is in the Seed a transchanging of the water existing in the earth of a Garden; and so that one onely water passeth into a thousand hot, sharp, bitter, sour, and cold Herbs: For not because any Seed is contrary to the juice or water in the earth; or that another sharp simple doth envy a sharp one that is neighbour to him, which doth lesse answer to him in the resembling mark of unity; far be it: For they proceed indifferently from the vitall Beginning of their own Seeds, where-

in hostile contraries are not entertained: For accidents, seeing they are the dispositions of Seeds, or of absolute Beings in themselves, not of Relative ones, and therefore ignorant of contrarieties, they follow also the guidance of their own Seeds, whose instruments, and products they are: Therefore the Table of repugnant things admits of contraries onely in the sensitive and wrathfull power of free Agents.

Secondly, It admits of privative things.

Thirdly, Last of all, of those things which do contradict in Relative terms. Since therefore there are not things absolutely contrary in nature; how carelessly it hath hitherto been proceeded in the fictions of Complexions, and healings of the sick, they shall see, whom the mournings of Widows and Orphans shall one day accuse; to wit, That for one only sluggishness, they have rashly subscribed to stupid heathenish Doctrines: And so, that indeed they have not hitherto so much as known the definition of nature, which I thus define.

Nature is that command of God whereby a thing is that which it is, and doth what it is commanded to do: But that fitly, because the Schools reject their own Theorems or Speculations; And do seem to set their Speculative Art to sale, the which as oft as they please, they do not follow: For in the Plague, and Malignant Feavers, they give Triacle, and other things not obscurely hot, as also medicines causing sweat, to drink, the indication or shewing token of heat being neglected: Also an *Erisipelas* the most fiery of Apostemes (as they say) they cure by applying of the best *Aqua vite*.

Lastly, If nature the Physicianness of her self, can overcome diseases by her own goodness, but not by a fighting quality: Let them shew I pray, what kind of cold it may be in a Feverish body, which may slay the heat of the same Disease at set hours. And moreover, if nature be her own Physicianness, what necessity is there I pray, that the disease should be bounded by a Crisis or judicall period, where there is no strife, nor disease cited, heard, or admitted for judgement? Where the Patient in the Beginning, is more able to strive, than himself, being brought nigh a recovery of his health! To wit, After many labours, pains, fastings, watchings, and evacuations? So now he of necessity ought rather to faint for feebleness, than to overcome strife, and to conquer his enemy by his own power: Yea, if any strength had been known to have been in the entrance of the Disease, plainly it ought to have been judged in the Beginning, when as he had a judge and witnesses in his behalfe, and an equall cause against the Trayterous disease: At least it is an unjust thing, and worthy of loud laughter, that the Judge himself be a party in the Crisis. Let sports depart in serious matters: For if Nature be ignorant of contraries (as I have shewn) surely these could not fight in us, and least of all so long as the creature stands in need of help or ease, and the disease was present: For truly, our nature doth alwayes work a univocal or single thing, whether it resolveth coagulated things, or at length coagulateth resolved things: For it doth no otherwise than as Gold-finers powder, which giveth a hardness to Lead, a difficult melting to Quick-silver, and Tinne, both which qualities it taketh away from Iron: Not indeed, Because that powder is contrary to it self, and to Metalls (which it perfecteth) in working, and adds to these what is wanting to themselves; to wit, That one only powder doth afford to every one of them, their own, and far diverse Dispositions which they have believed to be contrary, as hardness in Gold is to softness in Lead.

Let *Paracelsus* likewise give place, because he hath inclosed all healing in things, that are alike, by admitting in the mean time, the tempest of contraries: And although likeness doth involve a familiarity, and easie receiving of a remedy, its union, entrance, piercing by reason of an agreement of co-resemblance; Yet that good man was ignorant, that those are not Agents sufficiently requisite to healing; but are only occasional, external means, or Reconcilers of healing: Such as is also the purity and subtilty of a Medicine. Wherefore I judge, that a Medicine doth properly, immediately, and efficiently consist in that which belongs, or agrees, or in that which is appropriated: To wit, Whereby nature doth rise again from its fall. For truly, there are native endowments within things, which differ from that which is like; to wit, They are those wherein our *Archeus* doth find his delights.

For example; Hunger is as it were a very sharp disease, killing in good earnest, at least, through the sufferance of a few dayes: But it is not cured by contrary food, nor lastly by like food. Neither also doth hunger argue a defect of wasted blood: Otherwise, Bloody-Fluxes, and Blood-letting, should necessarily make men hungry: But in hunger there is a consuming of the nourishment of the stomach it self, from the vigour of the digestive, or hungry and devouring Ferment, whence at length a Cough is the perceivance of hunger. Indeed, as oft as the Ferment is well disposed, nor having an object on which it may act, it consumeth the proper nourishment of the stomach; therefore food doth allay hunger, not in

as much as it is contrary to the ferment, not as it is like to the same, but because it is an appropriated Remedy.

44 The like thing is to be required in the healing of any diseases whatsoever; to wit, a suitable fitting of the Remedy to the indisposition of the *Archæus*, and a taking away of the occasional cause: which appropriated agreement, or natural endowment of a Remedy, doth presuppose a proportion, as well in degree, as in quantity, a fitting, and application, together with a specificall matching of conformity. In this respect also it includes a shewing and knowing of the end, the disposition, and necessity of our faculties, and their agreements with the Remedy, whereto again the Dose is supposed. For so, Remedies may not onely answer to the likeness or equality of objects; but also to the determinations or limitations of the ferments.

45 *Paracelsus* sometimes supposed, That no Simple is fit for healing, unlesse it self doth first dye. And again in another place, That it is not sufficient for a Simple for that cause to dye, unlesse it be first reduced into the three first things, Salt, Sulphur, and Mercury (so he calls them;) Which error of the Affirmer, hath raised up in the Authour a frequent unconstancy: Because there are not a few Simples which do unfold the specificall property of their form, the Subject wherein they in-here being safe: Of which sort that comes first to hand, are Medicines tied about the head for the Head-ach, and very many Amulets, which himself calleth *Zenexton*. So indeed, we have pleasantly noted, That tremblings or beatings of the heart, the disgraceful pain of the Hemorrhoides or Pyles, inordinate Fluxes of Bloud, Falling-sicknesses, stranglings of the womb, and Fevers themselves, have been appeased by things hung on the body. So on the contrary, not a few distilled Remedies do scarce know how to dye, or to passe into the family of man; Yet great is their effect in diseases. Let *Paracelsus* also pardon me, because that resolution of simple Remedies is never made in our body: For I have elsewhere sufficiently taught, That the Digestion doth never tend to those late three first things; Nor that we that are ever nourished by these things, but by the one only, and the same, or colike liquor whereof we consist. Many things also, through their first boiling, do lay aside their former virtues: For so *Asarum* or Fole-foot, of a vomiting Medicine, becomes a provoker of Urine: And by the dividing of a thing into those three first things, its specificall Property is for the most part destroyed: For although they keep some kind of constitutive temperature of their composed body; yet they are by the fire made a new creature. Also he is happy, who by crude or raw Simples, hath known safely and readily to take away diseases: For it is the more ancient method of healing, noted in the Scriptures; Because the Almighty hath created medicine from the earth: For truly, a specificall Being cannot but be altered by the fire: Therefore not un-often, Extracts, and Magisterial Medicines are weakened. For indeed as *Alchymie* brings many things to a degree of greater efficacy, as it stirs up a new Being: So on the other hand again, it by a privy filching, doth enfeeble many things. Indeed, he acculeth nature of sluggishness and imperfection, whosoever thinketh the same to have perfected nothing without the fire: Let the seeds of things be the witnesses of these things: For some seeds do bud of their own free accord; But some do want sowing, and harrowing, but very few stand in need of the Art of preparing: at length none do admit of the fire, or of a resolving: For the powers or virtues which immediately stick fast in the bosom of nature, do act after the manner of an influence, neither will they willingly be submitted to the fire. But those powers which are immediately in the forms, not indeed of a Simple, but of Heterogeneous parts, do very often shine again in the more abstracted part of them: For so *Mace*, *Terpentine*, and *Asparagus*, do even paint their mark of resemblance in the Urine. But the powers which arise out of things by the fire, although they owe something to their own composed body, as it were the pledges of its family; yet certainly they are new, and transplanted branches, for the most part the Vassals of another Monarchy, even as elsewhere concerning the faculties of Medicines. For I have alwayes greatly esteemed the ordination of the Creator in the endowment of Simples: For in very deed, according to his mind, very many, or most Diseases do give place by Simples, as if they were driven out by a most old Wedge. But because I speak in the praise of Simples, I would not be received into a sleighting of the Art of the fire: But I speak only to those who admit of nothing besides those three first things, and do far preferre the Sweets drawn out of Herbs by stilling, before their bloody juices.

For first, They may learn, that the Juices of Herbs, and likewise the Broathes of fleshes, do season and keep from corruption for yeers, without Salt, Vinegar, Honey, Sugar, and Fire; Then at length they will easily despise the stilled waters of Herbs, no lesse than Syrupes: But when as the disease hath arisen into a degree, and hath intimately married, pro-

strating

strating nature; higher remedies are required, than those which nature hath of her own accord produced.

At length perhaps, I shall by many, be judged to have strived about Goats Wool, and onely about a name: And that, what the Schooles do call a contrary, I have strove to mask with the Etymologie of an opposite: But this punishment remaineth with me from the ungratefull onely. I speak to the Physicians, and Schooles, which admit onely of those Remedies of Diseases, which by a contrary hostile property, are reckoned to set upon Diseases by fighting: And who, by a contrary distemper (as they say) do diligently teach, that a temperature is onely to be obtained; of which sort of things that none hath at length, hitherto been, and plainly appeared in nature, I am satisfied: Neither is it sufficient, that they do require in a Remedy, superior forces related to the Disease; but also they will have that to come to passe, with the VVar of contrariety, strife, and a *Crisis*, if Victory be thence to be hoped for. Truly I have shewen, that such powers are not found in nature: Likewise, that neither do the seeds of things act from a hope and endeavour of Victory, or of trampling on their Patient, as being contrary to it: Nor also of overcoming the activity of the Patient: And so that there is not any contrariety, striving, hatred, VVar, combate of arrogancy, or superiority to bear any shew, or be preferred in naturall things, but that they act without an intention and foreknowledge of the end, as they were so created by God their Umpire, and were so endowed, and so commanded by him to act: Therefore it is clear, that contrariety as it is taught in the Schooles, to be implanted in any kinde of things, is banished from whole nature, except from the wrathfull faculty of living Creatures: and so, although self-love, sympathy, antipathy, choice, yea and some sense or perceiving may be attributed to things without life; Let it be an Analogy, or proportionable resemblance re-shining rather in their effects, and causes, than in the direction of the Creator, or Ordination of ends; because, in a proper sense, they are deprived of choyce, intention of acting, and foreknowledge of ends. But seeing any of these sort of things do plentifully witness, that they have a directer, strongly moving, and sweetly disposing the ends of all things even to their bounds; the unfoldings of their properties are Testimonies, that the most glorious God doth rule the rains even of things of small esteem, by powers given unto them, ignorant thereof: And so, that they are wholly right, without a knowledge of the end: that is, without their violent force, anger, strife, and hatred. So far is it therefore, that I judge the actions of things, and remedies, to be made by opposites (in the room of contraries) that I have equally banished, as well opposites as contraries, from nature; but I have admitted opposites, after the manner of a Relation of termes; But not in the way wherein they act on each other: For I have alwayes from the Age of a man, supposed; that if there should be contraries, or they should act as such, nature should not totally, exemplarily, formally, and dependantly respect its Creator: And that, of such a Creature, it could not be fitly said; *And God saw that whatsoever things he had made, were good*: if it could not unfold the properties planted in it, without hatreds, after a hostile manner. At length, how much opposite things, which I have reckoned among repugnant or resisting ones, may differ from contrary ones, those Physicians have known, whosoever do not burn with a pleasure of reproaching: Therefore let young Beginners mark, whether he who overthroweth the first principles of healing, from the intent of the Creator, striveth with me about a naked name who would have all things operate according to the endowment of nature conferred on it; not by contrariety, or a desire of destroying each other, but for the ends foreknown to God alone, who is love and peace; but not hatred, strife, or the fewel of contrariety: Therefore, from the intention of the Creator, are created things to be weighed. The VVoolf hath deceived the Schooles, who kills if he could, not one Sheep onely, but also the whole flock. Contraries are in man, and Beasts, by a power of animosity or angry heat, which is banished as well from the Minerall, as vegetable Kingdom.

At length, in mortall men, sins are opposed to virtues privatively, seeing Sin is reckoned a non-being. I may think habituall virtues not to be contrary to vices, as they do as yet reside in the understanding; but onely when the issuing of them out of the understanding is in the consent, wherein it is opposed to an animosity willing another thing, which in the Progress doth at first bring forth anger, hatred, grudges, that is, contraries: For out of the heart proceedeth Murders, Adulteries, &c. But a meer non-being doth not proceed, as neither doth it fall under a conception; seeing it hath not a Species of its own wherein it may represent it self.

Therefore sin is not onely a turning away from the Creator; but also a mentall or minde-like act of a determined wickedness or malice: but an act of the minde doth alwayes put on matter, whereon it decyphers its own Idea which it hath formed by conceiving, or imagining; and

and thus far it springs forth according to the Soyl of the Soull, into the faculties of the Body.

48 Hitherto, I have discoursed of Faculties created from the intent of the Creator: to wit, that there is not given an incentive or inciting Faculty of contraries and enmities, unto things existing without the animosity of sensuality: But it shall be profitable, to shew in this place, that by the same animosity, some things are made, which express a beast-like hostility; as, by the spittle of a mad Dog, the stinging of Serpents, Bees, &c. yet the same things do operate after the manner of poysons, and poysonfom Plants; which divine goodness, hath not created to hurt, or kill, or unto an ill end; but for other ends directed for the glory of his Majesty. But it will be very hard to attribute the contraries of Hostility to inanimate things by an accustomed, and wanton analogy of powers, to consider a matter or thing (to wit, the Spittle of a mad Dog, or of Serpents) to be imprinted by anger on a man, without that contrariety which we of our own accord grant to be in a brut Beast from whence it sprang: But surely, he shall with me, easily perceive it, if he consider, that poyson, whether it be created by a Beast, or prepared through the contagion of animosity, doth not therefore cease to be poyson, and to act according to the nature of poyson: The property whereof is, to act by a naturall force or power; yea although having risen from the impression of anger; yet this quality is no more anger to it, but a certain naturall product: and so wherein there is indeed a mark of anger and contrariety, but not anger it self: And therefore there is not a certain product like unto love, wherewith a man being stricken, or anointed, may by so much profit, by how much he is deadlily smitten by another product. Whence it is manifest, that that poyson, however it be produced by anger, and be mortall unto a man; yet that doth not happen through any contrariety; seeing that a direct contrary is wanting unto it, which doth equivalently or equally help, and promote the life, even as this poyson hurts it. And so, if these kindes of poysons do act by reason of contrariety; now the Maxim is false; *That so many wayes one contrary is said to be, by how many many wayes another is so said.* Therefore it hath now been sufficiently shewen, that poysons indeed, are made from the anger of Beasts; but it doth not therefore follow, that the poyson of a Plant, if it act (as was shewen above) by reason of its own naturall endowment implanted in it by God, and not by reason of any contrariety, that the poyson of brut Beasts is more capable of contrariety, than that of other Simples: Otherwise, the same thing is wholly to be judged concerning the poysons of those that have the art of poysoning, Sorceresses, &c. For although they are compounded, and given to the drinker; to hurt the minde: yet those do operate either naturally, and so without an intention of contrariety, or fight: or they operate by the power of the Devil; which is either solitary or singly alone, and so is truly a hostile effect (because from the evill Spirit an enemy) or naturall: And then, not by the force of contrariety or fight; but onely by the unfolding of its naturall endowment: The which I have already shewen above, to be void of contentious contrariety.

49 Furthermore, through occasion of these things, the efficacy of poyson prepared by animosity, is to be explained: it is known to the common people, *That the blood of a Bull doth strangle him that drinks it; but not the blood of an Oxe or Cow.* And that thing I have elsewhere referred to the fury of the Bull, with the desire of a dying revenge, after the manner of Serpents. But a Hog, although he perish with anger (perhaps therefore, God forbid the blood of living Creatures under pain of indignation) yet that is done with a fear of death. But the Bull is struck with so great a fury, that he suffers no apprehension of death: And so, although his blood be poysonfom, yet not his flesh; Because his fury approaching nigh unto death, hath not space enough to defile his flesh. But a mad Dog, because he was a good while mad before death, doth also infect his flesh. Therefore fearfull Animalls, as the Mouse, Toad, &c. do centrally besprinkle their fleshes, and bones with a certain fear: Even as I have demonstrated elsewhere in the *Plague-grave*. But hitherto hath that Maxim regard, *Morta la bestia, morto il veleno*: The Beast being dead, his poyson is kill'd: which surely hath place in a poysonfom living Creature; because between while, he burns with a fury of revenge. In brief, if the vertues and endowments of Simples be adverse to us, that proceedeth from Divine Ordination; but not from the Idea or Image of revenge, or hostile contrariety: For these do far differ from each other; to be contrary to any thing, and to have hurtfull endowments in nature: For truly this proves Gods order and variety of powers appointed in nature; But that declareth Hostility, an enemy to God and nature: therefore they differ in their end; That is, in the institution and direction of God in nature: which is, in the order, intention, ordination, and so in the whole scope of the minde of God: according to which, I consider contrarieties in Brutes, and in Man, and not in other Simples, and least of all in the Elements.

ments. And therefore to conclude; the question is not here, about a name; if I shall overthrow the contrarieties of Elements, and their fights, and successive courses of Complexions in things falsely believed to be mixt: even as also, whatsoever hath from these Suppositions, been hitherto prated in the behalf of life, a Disease, Death, and Remedies.

CHAP. XXIV.

The Blas of Man.

1. The error of the Schooles about the first Moover. 2. Aristotle contradicth himself. 3. Blasphemy in a Christian. 4. An error hath flown from Science Mathematicall badly appropriated. 5. The Blas of man doth imitate the flowing of the Stars. 6. When our Blas doth go before, and when it followes the Blas of the Stars. 7. Why the Blas of Bruits goes before that of the Stars. 8. A voluntary Blas is not annexed to the Stars. 9. A twofold Blas in us. 10. Whence unsensitive things are moved. 11. Galen resisteth Aristotle in the Pulses. 12. He sought into the measurings of pulses, but not into the efficient cause. 13. The use of the pulses with Galen. 14. A third use unknown to Galen. 15. The consideration of the Authour. 16. That a cooling refreshment is not the end of pulses. 17. Some suppositions. 18. None hath treated concerning life. 19. Contradictories concerning the fire of the heart. 20. Whether a pulse be for the procuring of Colds sake. 21. Why the pores in the inclosure of the heart, are triangular. 22. Wherein the venall blood, and the arteriall blood do differ. 23. The sensitive soul is the framer of pulses. 24. To what end the motion of the heart is. 25. The absurdities of the Schooles concerning radicall heat. 26. The motion of the heart cannot be judged to be for cooling refreshment sake. 27. Why a Feverish pulse is swiftly moved. 28. A Thorn in the finger teacheth that from the swiftness of the pulse heat is increased, but not cold. 29. Five chief ends of the pulses. 30. How the kindling, and enlightning property of fieryness do differ. 31. That the Spirit of the blood is not from the Liver. 32. It is a rotten Doctrine which confoundeth the ends of pulses with breathing. 33. The necessities of pulses have been hitherto unknown. 34. The use of the pulses hath respect unto the digestive Ferment. 35. The sluggishness of the Schooles about these things. 36. why healthy Sailers are more hungry than themselves not sailing. 37. The Air cannot nourish the spirit of life. 38. An Alkali is formed by burning up. 39. The wonderfull Coal of Honey, and divers speculations of Chymistry are cleared up. 40. The Common-wealth of Alkalies. 41. The fabrick of the Balsam Sameck of Paracelsus. 42. An Alkali is made volatile, and so interchangeably under the same formall property of a composed Body. 43. Of the labour of wisdom. 44. An Handicraft Operation of distilled Vinegar. 45. Some Handicraft Operations of Chymistry are re-taken for the finishing of the venall blood without a dreg. 46. A new and unheard of use of the pulses. 47. There is an unwonted pulse from the part grieving through a Thorn. 48. Pus or corrupt matter being made, why Symptoms wax milde. 49. Whence the hardness of an Artery may straightway be made. 50. What a hard pulse may portend. 51. That the use of the pulse differs from the use of breathing. 52. While Pus is made, the labour is greater. 53. The quality of a vulnerary or wound-potion. 54. It is false

false, that the bowels are by nature hotter in Winter. 55. A contradiction of the Schooles. 56. A begging of the principle. 57. An eightfold scope or aim of the pulses. 58. As there is not a Livery Spirit in the venal blood; so neither is there an Animal or sensitive pulse of a proper name, in the shop of the Brain.

1 **T**He Elements, Complexions, Compositions, and Causes of natural things, for natural Philosophie, being already dispatched: to wit, After the birth of forms, the ignorance which circumvents mortal men about the Beginnings of healing, being unfolded; also the necessity of Ferments, and of *Magnum Opus*, being perfectly taught: Now therefore I will examine the Beginnings of life.

The Schools have taught, *That in every locall motion, a first unmoveable Mover is of necessity to be appointed*: Which thing, I neither find true by Art, nor Nature: For the demonstrating whereof, A drunken man of an unstable mind, and foot, in a floating ship, goes and hangs a weight on a Clock: Therefore in voluntary motions, there is not required a first stable or unmoveable Mover. Likewise, the Sun doth with his beam enflame Gun-powder through a Glasse. This first Mover hath not any thing in his possession, that may be unmoveable: That thing is also already manifest in the fire, an irregular Being. Thirdly, In nature every seed being once conceived in a due place, doth not cease afterwards by its own motion, to stir the lump subjected to it: Therefore the true and first Mover of seeds in nature, and work-man of all things moves himself first, & doth not require a motion beyond his own motion: And whatsoever doth stir up any natural Mover to move, is its very own proper and internal Beginning of motion, and it falling into improper places, dyes, and its motion ceaseth. Therefore the

2 *Aristotelicks*, who call Nature the Principle of Motion, or the first Mover, do by an absurd forgetfulness, require an unmoveableness in the first Mover. And although seeds have need of an external fewel or nourishing warmth, or Stirrer up, yet the stirring up is not an inward motion, nor a mover of the same motion; But is only an alteration accidentally hastening or ripening the power of its own motions, or the activity of the first mover, otherwise, weaker than that which may be for the moving of its own matter: Which activity seeing it is a certain accidental successive alteration, which in very deed, is not in it self at rest (so far is it from being unmoveable) neither also doth it remain in its antient and one state: Surely it confirms the *Archens*, that he may the more strongly unfold his inbred strength of moving, and may direct it unto his own ends. But if indeed the Schools would have their *Aristotle*, (although unfitly a Naturalist) yet in this place to have had respect in natural things, unto the one and first supernatural Mover of all things, who is the independent Beginning of all motion; Truly, I respect that as impertinent, it being without natural Philosophie: For that most glorious Mover hath given powers to things, whereby they of themselves, and by an absolute force may move themselves, or other things. Indeed, it is impertinent to run back to God the Mover, to demonstrate the natural motion of Bodies.

3 But neither also is the blasphemy to be endured in a Christian, which requireth God of necessity to be unmoveable; that he may be able to move other things: For truly, God doth not move by a touching of extrems, and by an attraction, or expelling of things. Lastly, Neither doth a thing that is moved, attain vertues from the unmoveableness of the first Mover, as it fore-requires this: But the Divine beck or pleasure strongly reacheth all things from end to end, but not being constrained by a necessity of co-touching of extrems, pressed with consequence, led by manner, or subjected to a Law: But being altogether free, as well in his beck and motion, as in rest, he indifferently and alike powerfully moveth all things: Therefore his own unmoveable essence doth not import a necessity required of the Schools, but the meer good pleasure of his glory. For his own word (*Fiat* or *Let it be done*) hath departed into nature, which afterwards is for the moving of it self. So B. Gregory saith, *That there is a power conferred on the earth, whereby it may thrust forth Plants from it self*. Therefore it is a Paganish Doctrine drawn from Science Mathematical, which necessitates the first Mover to a perpetual unmoveableness of himself, that without ceasing he may move all things.

4 The errour is to be indulged in *Aristotle*, not in Christian Schools defiling young Beginners: for otherwise, there is no motion naturally made, but from a motive Principle, which moveth not other things, unlesse it be by it self, and in it self moved. And moreover also, in artificial, and natural things, if any thing be moved by an external Mover, and in that motion if the mover himself be supported by some unmoveable foundation; as suppose when a Mariner thrusts back a ship from an unmoveable bank by a staff, the shoar or bank doth not move the ship,

ship, neither doth it naturally contain a motive power in it, but it is onely a means by which the mover measureth his motion; to wit, on which the mover himself stablishing himself as it were on a bottom, doth by weight and the acting forces of Science Mathematical, frame his own motion, (which otherwise is wholly moveable, and is actively moved:) For so a Gun doth the more strongly cast out a Bullet, if it hath a resisting unmoveable body behind it. But surely, as that body is not motive, so it doth not but by an absurdity, require an unmoveable mover, and is unfitly compared to the first Mover: Yea in natural bounds, the first and totall Mover is Gun-powder enflamed, which that it may be moved, it requireth no unmoveableness, but that it may measuringly move, it hath need of a measured instrument: Therefore it is impertinent to think, that all motions are made by God the first Mover, as if he did move all things moved, with a certain staffe. It is also an impertinent thing while it is searched into, whether the Mover as he is such, ought of necessity to be unmoveable: it is answered, That the first mover shall measure his motion, and more strongly move, if he be unmoveable, or it is strove against an unmoveable foundation. Is that to have taught Christian Philosophy? For indeed, it is not to be doubted, but that the Stars by their various aspect which they beg from motions, do infuse a Blas motive of the water and aire, that they might be to us for seasons, dayes, and yeers. Again, in that the earth hath received an inter-nall Beginning of propagating Plants before the Stars were born; therefore bruit beasts, although they were more latter than the stars, yet the seeds of these are not more ignoble than the seeds of plants, or annexed to the stars by the band of a greater subjection: Because the Stars were before the Creation of sensitive things; therefore it was meet, that the Blas of men should not indeed follow the guidance of the Stars, but only that it imitate the motion of those, not as of motive powers, but no otherwise than as by a free motion we do follow the foot-steps of a Coach-man or Post: for so our bowels have perhaps assigned the Planets as their fore-runners: For every bowel forms a proper Blas to it self within, according to the figure of its own Star, which also hence is called Astrall or Starlike: Because it imitates the foot-steps of the Heaven, as well in the priority of the dayes of the Star its fore-runner, as in the Laws of appointments in nature.

Otherwise, In infirmities, as all the endeavour of nature is sumptomatical; so then the Blas of man goes before, and fore-sheweth future tempests; whereas otherwise in health, a humane Blas doth ordinarily follow after the remarkable successive changes of times or seasons.

But bruit beasts, as they were created in a day before man, so their Blas doth alwayes go before, and fore-run the Blas of the Stars: Wherefore many Prognosticks of a Meteor are drawn naturally from beasts: And superstition hath had access thereto, which hath added Divinings and Sooth-sayings to the credulous and superstitious.

Yet the Blas which is by the will of living creatures, directed to a local motion, surely that is by no means connexed unto a Supernatural or Coelestial circumvolving motion: Because all carnall Generation flows out of the power of the Seed, and the power of the seed from the will of the flesh: Therefore fleshly generation hath a Blas of its own, readily serving for the uses of its own ends, flowing out of the Beginnings of its own Essence, which are the will of the flesh, and the lust or desire of a manly will. Therefore there is in us a twofold Blas: To wit, One which existeth by a natural motion; but the other is voluntary, which existeth as a mover to it self by an internal willing. Hence therefore it is impossible, that the predictions of the Stars should rightly conclude in us. It hath now been sufficiently demonstrated, that there is something in sublunary things which can move it self locally, and alteratively, without the Blas of the Heavens, and an unmoveable natural mover. The will especially, is the first of that sort of movers, and moveth it self; also a seminal Being, as well in seeds, as in the things constituted of these. Moreover as God would, so all things were made: Therefore from a will they were at first moved: For from hence whatsoever unsensitive things are moved, they are moved as it were by a certain will and pleasure or precept of nature, and have their own natural necessities, and ends; even as is seen in the beating of the Heart, Arteries, expelling of many superfluities, &c.

For Galen hath artificially enough distributed the Pulses, yet being by Aristotle deluded therein, who supposed the end, and efficient to be externall causes, and thought the ends of Pulses to be their totall Causes. For he passing by the proper Blas of the Pulses, searched only into the ends, and necessities of nature, for which things sake, indeed, the Pulses should not be made, but rather measured or modelled.

And therefore he hath distributed the differences of Pulses into a Scheme or Figure, only by their ends: And so that therefore he hath not reached their more potent and efficient respects: Therefore he hath reduced the Causes of Pulses unto two heads of necessity: To

- 13 wit, To the cooling refreshment of the heart, to which end the Heart and Arteries should at once dilate themselves; and to the casting out of smoaky vapours stirred up by heat. For which cause indeed; the Heart and Artery should at once presse themselves together; and fall down at once for fear of choaking: which two, by variously interweaving them with their Correlatives, according to strength, swiftnesse, weaknesse, hardnesse, and greatnesse; he hath compiled the differences of Pulses by an artificial diligent search: And I wish that his other writings did not bewray, that these things were transcribed out of some other Authour. But
- 14 the Antients being not contented with two ends; to wit, cooling and refreshment, and expulsion of smoakinesses, have added a third, which was the nourishment of the vital spirit by aire. As if indeed aire could ever be made virall spirit: For if the Spirit be increased or nourished by aire adjoynd to it, (seeing a Simple Body is not to be digested) now only by mixture, virall spirit should be made of aire; and now all things shall no longer be nourished immediately, of those things whereof they consist: Therefore it hath been the ignorance of the Antients, who knew not the constitution of the vital spirit, thinking that a little water being co-mixed with much wine, or a little Tinne/co-mixed with much melted gold, should be made wine, or gold. I will tell here what I have perceived, after that I made more use of discretion, than of the sloath of assenting.
- 15 Therefore I began first to consider, That heat was not primarily and of it self in the heart, but to be a companion of the life and soul, a sign, and mean of operation in living creatures that are hot from the nature of the light of the Sun. But in fishes that the life is of the nature of a cold light, and therefore that it subsists without an actual, that is, a true heat.
- 16 And therefore, that a Pulse is not made in nature, for a cooling refreshment of the heart, and puffing out or dispersing of smoaks, a dissected Frog will teach: For in a living Frog thou shalt see his Heart and Arteries to be moved, his Heart at every Pulse, or by dilating, to wax red, and by contraction or pressing together, to wax more pale, although it be not transparent: Notwithstanding, seeing the Antients thought heat to be the cause of Pulses, yet there is none that hath decyphered that heat by its heats, by what way, reason, and mean that heat is stirred up, kindled, and doth persevere in us, because none hath meditated of life and forms; And therefore none also, of the efficient cause of Pulses.
- 17 None indeed hath hitherto doubted, that heat springs from the Heart, and none contesteth, but that the young is at first nourished by its mothers heat, untill that through maturity of dayes, a fewel of its own be kindled in it.
- 18 But what that fewel is, and why it being once kindled, doth not presently dye, and doth continue even to the end; none hath diligently searched into, because all have passed by the life. The Schools indeed do feign a fiery heat in us (contrary to *Aristotle*, who will have this heat to answer in proportion to the Element of the Stars, and hath distinguished it from an Elementary and Fiery one) also that it lives by devouring and consuming of the radical moisture: whence it would follow, That the heart is the Torch of a consuming fire: But notwithstanding, seeing the substance of the Heart, and *Pericardium* or case of the Heart, and also of the Blood, is not fit for fire:
- 19 They have been forced to confesse that fire not to be fire, and that heat not to be fiery, yet devouring; but they have said, *It is sufficient for them to have described the Fewel or Torch, or Beginning of heat Metaphorically*; As if nature should admit of Metaphors: For first of all, I remember that some swooning Virgins were bereft of Pulse and breathing, so far as was conjectured by humane judgement, and so for some hours were bewayled among the dead; yet that they revived, and being married, afterwards to have lived without sicknesse, and to have brought forth five or six times.
- 20 For they were cold as Ice, as soon as their Pulse had failed: from whence I began to be doubtful, whether the Pulse were not made rather for the effecting of Hearts sake, than through the occasion of fetching in cold: whence I began to account the final causes of Pulses to be frivolous, and so also I suspected the presaging part of healing to be weakened: And that I thus prove: For there is Hedge or Partition between both bosomes of the Heart; in it self, as long as life remains; So *Pore*, That by the attraction of the ears of the Heart (for on both sides it is reckoned to be eared by way of proportionable Resemblance, because it hath as it were Bellows) the Veinie Blood doth passe from the hollow Vein (forming the right bosom of the Heart by its passage) and wanders into the left bosom; not likewise from hence to the right bosome:
- 21 Because the pores in the hedge or partition it self are triangular, whose Cone or sharp point ending in the left bosom, is the more easily encompassed or pressed together; but the Base of that Triangle in the right bosom, never but by death: But the blood of the left bosom, is now arteriall, and is the blood of a true name, being diverse from the blood it self, as being yet

yet in the hollow vein, in colour, and subtility or fineness. Wherefore I must needs, not without cause, have found out a new or fourth digestion in the left stomach of the heart: For no otherwise than as the blood of the veins differs from the cream and chyle; so also doth the blood of the Arteries differ from the thick blood of the veins, although by a neerer kinne, and cloathing of the Heavens, they have after a sort returned into one Family: Yet in that is the specificall difference of both, that the arterial blood is informed by the immortall Soul, in the left bosom; but the venall blood nor, and that it is illustrated onely by the light of the sensitive form participatively, but not informatively: For the other digestions do require rest: But the fourth is perfected by an uncessant continuation of motion: Not indeed that the very motion of the heart is the formall transchangeative cause, but onely that it concurs dispositively. Indeed, in the left bosom of the heart, as it were in a stomach, doth a singular, most vitall, and lightsom Ferment dwell, which is a sufficient cause of the venall blood its being transchanged into arterial blood, even as it is chief in the transmutation of arterial blood into vitall Spirit. Because all venall blood doth naturally tend into its own end, which is nourishment; yet at last it is dispersed and vanisheth away into a vapour, or into a Gas, unless it be stayed by the *Coagulum* or co-thickning of growth: But the arterial blood, hath for its aim, not indeed that it may incline into a smoakiness, or excrement: For if that thing come to passe, it happeneth to it from a Disease, and by accident. After another manner, the proper object of the arterial blood is to be brought over into vitall Spirit: which if afterwards it doth also vanish, let this be unto it besides its intent; Seeing that every Being doth naturally desire to remain: For the vitall Spirit is a light originally dwelling in the Ferment of the left bosom, which enlightheth new Spirits bred by the arterial blood, to wit, for which continuation of light, the Arterie is lifted up: For thus the Spirits are made the partakers of life, and the executers thereof, even as also the *Vulcans* of continued heat. Therefore the life of man is a formall light, and almost also the lightsom or clear sensitive Soul it self, and so death doth forthwith follow the blowing out of this: Because the immortall minde is involved in the sensitive Soul, which after death flies away, this other perishing. But far be it, that that vitall light be called fiery, burning, and destroying the radicall moysture, and that by the continuall plenty of the smoakie vapours hereof, it should defile the heart and Arteries: But it is a formall light (even as I have said before concerning Forms) for neither shall he ever otherwise describe the in-most essence of life, who had seen the formall lives of things even in an Extasie: Because words are wanting, and names, whereby these may be shewen or called, as it were by an Etymologie from a former cause. And although God had shewen to any one the essence of life in a composed Body; yet he will never give his own honour of teaching it, unto any Creature; Seeing life in the abstract, is the incomprehensible God himself.

For so by little and little, the meat and drink ascends into the Chyle or juyce of the stomach, into the juyce of the mesentery or Crow, into venal blood, and at length, by arterial blood, unto a most thin Skie or Air, the vitall Spirit, and the prop of the Soul: which exchanging doth presuppose a motion of the heart: For neither is it sufficient, that the Ferment be effective efficiently, that the arterial blood be quickened, and turned into Spirit, and it to dwell in the left bosom of the heart, unless a pulsative motion doth concur, which is likened to the motion whereby sowrish milk or cream by a true transmutation is changed into Butter.

For by the motion is made an extenuating, not indeed of the soure, but of the salt arterial blood; neither therefore is it turned into a fat or butter, but into vitall Spirit, of the nature of a Salt, and so of a Balsam: For so the arterial blood, is by motion, heat, and the Ferment, changed into an Aiery or Skie off-spring, the immediate Inne of a vitall light. Wherefore, the Blood, Water, and Spirit are one and the same: For if that light be in the Spirit, but this be carried thorow the Arteries into the whole Body; also that light ought to be on every side continuall to it self, seeing it is the property of light else to be extinguished. Therefore the Arteries ought to remain open; so indeed, that they do never remain long pressed together: wherefore it was also meet that the pulse should dilate the same, nor so to be pressed together, that the whole Arterie should wholly rush or fall down on it self: perhaps therefore it is not unjustly cloathed with a double, and harder coat. For the discontinuance of that light, is the cause that in one moment, every chief faculty of the Brain in those that are hanged, doth perish: But not that the Spirit had so quickly vanished from the Brain. Again, if a pulsative motion should not be made, a deadly cold would straightway arise, and we should be more cold than a Frog: So that, although many things do live in the Winter time, without breathing, under the Clay, yet not without a pulse. Also the Ferment of the

left bosome doth transchange its own arterial blood, not without a slow delay, and would send it thorow the Body every way, too slowly, and therefore it should not satisfie the importunate necessities of the Spirits. For let us feign a Bottle seasoned with an Odour, but to be filled with Liquor up to its half: For that Liquor shall scarce snatch the Odour of the Bottle; but if it be shaken together, that Odour also doth presently insinuate it self through the least parts of the Liquor. So indeed, is the vitall Ferment of the left bosom presently given to the Arterial blood by the motion of the heart, and doth compel it also to a hasty obedience of its own Impression: For light is easily kindled by light; and therefore also the Arterial blood being now quickned, it easily snatcheth to it the light of that Sunny Lamp, and is brought into a Skye or Aiery off-spring. Therefore the Blas of the heart is the Fewel of the vitall Spirit, and consequently of its heat; but the Spirit being thus enlivened, is the mover of the heart, almost neglected in the Schooles. Also by consequence, that motion is made for a necessary heat in Sunny constituted Animals, and for the framing of Spirit in them: Therefore I may not believe, that the Pulse is appointed for a requisite cooling refreshment of the heart: For truly things that have life, do not war under the deadly Ensigns of cold: neither do they intend or hearken to cold, but onely do meditate on vitall things. Indeed, cold in us, is a token (because a Companion) of death: And therefore whatsoever it should attempt in the Fountain of life, it should intend a taking away of life; as also it should be destructive to our Monarchy, so far is it, that cold should be for necessity and co-temperaments sake: For without a Pulse, heat is not over-much kindled; but straightway also, life remaining, heat dies. For the Schooles being deceived, do thus judge, they thinking Elementary fire to be for the composition of Bodies, and that fire in its heightened degree, (without which its fire ceaseth to be fire) doth consist in the heart; and that indeed Kitchin fire, seeing else a ridiculous fire is to be far fetched from the concave of the Moon; otherwise, it should not by a loosed Bridle, slide downwards safe, at the pleasure of inferiour Bodies, and contrary to its own disposition, thorow so many colds of the Air, unto the ordinary constitution of Simples.

25 And so, if the Schooles had instead of radicall heat, understood a fire feigned to be under the circle of the Moon, they should improperly say that the same doth onely subsist in us, as it were the Torch of radicall moisture: Seeing else they dream that the fiery Element (which they rashly feign) doth (alike unwisely) live without a necessity, and consuming of nourishment. Therefore the Schooles do understand that there is in the heart a kindled, Kitchinary and smoakie fire, and that it is hot in a great degree, and so that unless it be tempered by a continuall blast of new Air, and all the smoakiness raised up by this fire be fanned out, there is danger of choaking, burning up, and enflaming: For so, false authorities do bring forth false positions, and through the ignorance of causes, the speculations of healing have perished.

26 Truly in my judgement, the Schooles ought at least to have remembered, that the very blowing of the Bellows doth not refresh or cool the fire, but rather enflame it: Neither do I see by what reason the motion of living Creatures may be the cause of their cooling refreshment. In the next place, I know that fire is in no wise to be joyned to the other Elements, being divided by their least parts, but that in an instant it is extinguished. I know also, that its impossible that fire should be able to exist, which is not truly fire, and hot in the highest degree: And so that if nature should attempt refreshment or cooling by a Pulse, its endeavour should be foolish, vain, and impossible: Whence a horrible thing followes; that God in the ends proposed to himself, hath actually erred: Therefore let the Schooles repent. But besides, there ought to be a speedy transmutation of venall blood into arteriall blood, and of this, into vitall Spirit, least that after faintings, and tremblings of the heart (under which are made most speedy divisions and scatterings of those Spirits, so that the little pits of the small Pox or measles, before not to be beheld, do straightway appear) as it were a necessitated death, do invade. Therefore aid was not to be fetched from far; and to be deferred, which his speedily required.

27 Indeed, this is the reason, why in a Fever the Pulse is swifter, but not an expelling of smoakiness, nor a greediness of cooling refreshment.

28 For truly, let a Thorn be put in the loose or fleshy top of the finger, there is presently a hard, strong, and more swift pulse, but afterwards for the increase of the Pulse, there is every where presently an increase of heat, but not of cold; and indeed, as well before as without the births of smoakie vapours. And then, at the beginnings of intermitting Fevers, after some houres, and as long as the cold is delayed, the Pulse is little, slow, deep or depressed; yet putrefaction is kindled (if the Schooles have spoken truth) and therefore also the present smoakie vapour in the Schooles, is the cause of the fit; and they do thirst greatly in their cold, and

and vomit up yellow choler: Therefore also there ought to be a most frequent pressing together of the Pulse, and the whole Pulse to be most exceeding swift: Especially, because many dying in those Fevers, do perish in the cold a little before the Feverish fit; through a great want of the Spirits, and being as it were choaked. But in troublesome heats, also in an *Erysipelas*, the burning Coal or Fever, the *Perisick* fire, &c. the vitall Spirit being incensed, and as it were provoked to anger by the diseasing cause, waxeth exceeding hot; as appeareth in the aforesaid locall, also burning Inflammations: whereas otherwise, a temperate light-some kindling, doth on every side shine forth under a vitall Harmony: yea, that a little before death or sounding, the horny membrane of the Eye is seen to be deprived of light, the fire being not before in a burning rage. Furthermore, the transmutation of the Arterial blood into Spirit, which is begun in the heart, is ripened in the current of the Arteries, or stomach of the heart: Neither therefore is it a wonder, that in the Spleen abounding with so many Arteries, a Ferment, and the first motions of the heart are established instead of a stomach; the mentall and sensitive Souls, being indeed *Saturns* Kingdoms: For the digestion of the heart, is with a full transmutation of the arteriall Blood into Spirit, without a dreg, and smoakiness: Because it is that which neither containeth filths, nor admits of diversities of kinde; neither doth the Spirit the Son of heat, degenerate by reason of heat. Indeed it is the immediate operation of the sensitive Soul, alwayes univocall or single, like to it self, and to life, for the life that is uttered by vitall motions. Therefore the chief aims of the Pulses, are,

1. A bringing of the venall blood from the bosom of the hollow vein, unto the left womb of the heart.
2. An increase of heat.
3. A framing of arterial blood.
4. And again, a producing of vitall Spirit.

5. And then there hath been another ultimate aim of Pulses, to wit, that the original life residing in the implanted Spirit of the heart, may be participated of. Therefore I will repeat what I have said elsewhere: To wit, that some Forms do glister, as in Stones and Mineralls; but some moreover, do shine by an increased light, as in Plants; but others are also light-some or full of light, as in things soulified.

And so a vitall light-somness is granted to the vitall Spirit, by a kindling, not indeed of fire-ness; but of enlightning, and specificall or differing by its particular kindes: So indeed, Fishes do not live more unhappily, are more straightly, and lively, and longer moved than hot brut Beasts.

The Schooles in the room of those things which I have already demonstrated, do suppose the blood in the Liver to receive the nature of a Spirit, which perhaps they therefore call naturall: To wit, such an Air as is wholly in all juyces of Herbs, and from hence at length, they will have the vitall Spirit to be immediately bred and made: But I do from elsewhere derive the Spirit, and from a far more noble race: But whether the Schooles, or I, do more rightly philosophize, let the Reader judge, who now drinks down both Doctrines together: he being at least, mindefull of that which I am straightway to say, to wit, that sometimes the whole arterial blood, and the nourishable Liquor created from thence, or the nearest nourishment of the solid parts, are at length dispersed by the transpirative evaporation of the Body, without any dregs or remainder of a dead head: And therefore, that the Reader may from thence think, that the arterial blood is of it self inclined, that it may sometimes be made Spirit; which is not equally presumed of the vapour of the venall blood: For therefore they have been ignorant, that the whole blood of the Arteries, is often turned into a spiritual vapour, or vitall Spirit: But the venall blood, if it be changed in our Glasses by a gentle luke-warmth, into a vapour, it leaves a thick substance, and at length, a Coal in the bottom. Therefore the Doctrine of the Schooles is far remote from the knowledge of the Spirits, who think the vitall Spirits to be framed of a vapour, or watery exhalation; for they have neglected in this vapour of the venal blood, how, of bread and water, and venal blood prepared thence, nor indeed a watery exhalation (as they think) but a Salt, and enlightned Spirit is stirred up, and its heat not onely made hot, but also making hot: For no Authour hath hitherto diligently searched into that vitall light whereby the Spirit is enlightned, and is after a sort made hot: So that the Life, Light, Form, and sensitive Soul, are as it were made one thing. Again, the rotten Doctrine of the Schooles, confoundeth the ends of Pulses and breathing: To wit, that Breathing is made for the nourishment of the vitall spirit, the life of the fire (which they will have to be nourished with aire) the cooling refreshment of the heart, and expelling of smoaky vapours: For they intend or incline to nourish the vitall heat, and coolingly to refresh, or to diminish it: which things, how they can agree together, let others shew; I am willingly

willingly ignorant thereof, at least in the greatest want of vital spirit: and while the increase thereof is chiefly desired, then indeed there is the least, and slowest elevation of the Arterie: And on the other hand, while the Spirit aboundeth, there is the greatest elevation of the Arterie. I confesse indeed that breathing is drawn by the bridle of the Will, or by the instruments of voluntary motion, but the Pulse not so: But seeing that a sound breath may satisfy by its breathings, the ends of the Pulses, the Pulse should not therefore be necessary, as long as any one is cold, and his breathing doth sufficiently inspire. But seeing notwithstanding in the mean time, the Pulse doth not therefore pause; surely there must needs be one cause, or necessity of the Pulses; and another cause, or necessity of breathing: For we perceive the necessities of breathing; we also do measure our breathing at our pleasure, and some can wholly press it together, or suppress it in themselves; But why do we not feel the more vitall, and no less urgent necessities of the Pulses? Chiefly seeing it is the life that is the Original of sensibility, which alone indeed doth feel all its own necessity, and doth alone exclude us from every act of feeling: Wherefore hence I conjecture, that there are other necessities unknown to the antients.

33 I know indeed, that from the Arterial blood, and from the vital spirit, there are no dregs, filths, or superfluities expelled (as I shall shew in its place) but that linaky vapours are wanting where there is no adustion; but that the venal blood in the wasting of it self, by the voluntary guidance of heat, doth produce a Gas, as water doth a vapour or exhalation: And that, that Gas (which the Schools do signifie to be the spirit of the Liver, or natural spirit of the venal blood) is subsequently of necessity expelled, it remains without controversie: For otherwise a man being almost killed with cold, should the sooner wax hot again, if he should for some hours hold his breath (understand it, if the breath should be drawn for cooling refreshment) notwithstanding neither indeed in that state doth he notably stop his breath upon pain of death. Also a fish wants Lungs, and breathing (for the bubbles which do sometimes belch forth, are blasts or ventosities of digestion, but not breathings.) But Frogs, and Sea-monsters that utter a voice, have little Bellows which perform the office of Lungs; yet Fishes are not colder than Frogs: yea Frogs, and Horse-leeches are preserved under the mud all the Winter, from corruption, and do live without breathing; yet not without a Pulse: Therefore there is one use of the Pulses, and another of breathing, and neither for heat only: For in the most sharp and hot diseases, to wit, as oft as there is the greatest breathing drawn, and that like a sigh, the Pulse is small, and swift, also the strength remaining: Therefore the use of breathing, and the Pulse, do not answer; especially, because we are more refreshed by a great draught of cold water abundantly drunk, than if the same quantity be drunk at many times: I say, we are more refreshed by one only sigh, than by many small, and more frequent breathings: Even so as a pair of Bellows doth perform more by a great, and continual blast, than by those that are lesse exact, although many: whence it may be sufficiently manifested to a well considerate and judicious man, that there is another use of the Pulses of greater moment: to wit, That which respecteth the ferment of digestions.

34 Whence I repeat a handicraft operation: to wit, That at length, under the last digestion, all our Arterial blood doth perish and exhale, neither that it leaves any dreg behind it: Yet whatsoever doth exhale by heat alone, all that, as well in living, as in inanimate things, doth leave a dreg behind it (the skilfull do call this *The dead Head*) which dreg being at length thus roasted, doth resemble a Coale. For the action of heat is, of it self every where Simple, Univocal, and Homogeneal, differing in the effect, by reason of the Matter. Therefore if the vitall blood ought to be wholly so disposed in us, that it be at length wholly blown away without a dead head; it was altogether necessary that that should happen by some other Mean than that of heat: But the aire was alwayes and from the beginning, every where the seperater of the waters from the waters. This hath not been known in the Schools; to wit, that the whole Venal blood, that it may depart into a Gas, it hath need of two wings to fly, the aire, and a ferment. Wherefore observe thou, That as oft as any thing of blood becomes unfit, or is not by degrees disposed of, and undergoes its degrees in the outward part of the body, that it may wholly throughout the whole be made volatile and capable to flye away or thorow the pores, at the same moment, now Scirthus's, Nodes or Knots, and Apostems are conceived: but if that thing happen in the more inward part thereof; for the most part *Feveres*, *Apoplexies*, *Falling evils*, *Asthma's*, likewise pains and deaths do soon follow. Let us see therefore what the aire, or what a ferment may conduce hereunto. First of all, Every muckilage of the earth which else is easily turned into worms; likewise Starch, Fleshes, Fishes, &c. being once frozen, at that very moment do lose their muckiness, and return into water; As the aire was once very well combined to the Ice (as I have sometimes spoken concerning the weight of Ice) and so it is the first degree whereby the aire doth resolve a tough body

body into water. And then under the greatest colds, and purest aire, we are more hungry, yet we sweat, and less is discuffed out of us, with a small and more hard siege or excrement.

Therefore one that saileth in the Sea, ears more by double, if not by treble (unlesse he be sick) and lets go less excrement than himself doth, living at Land: whence is the Proverb; *The water causeth a promoting of digestion*: As if indeed, he that saileth should not float in the aire, but in the water! but floating doth renew the aire in us, and from hence there is a stronger digestion: Therefore, if we do eat more strongly, and do cast forth less excrements, it necessarily follows, that the more is discuffed, or doth vanish out of the Body; which is to say, That the more pure Northern and Sea-aire doth conduce to a transpiration or evaporation of the body, or doth dispose the blood unto an insensible perspiration or breathing out of it self.

Surely for that cause is breathing made, not indeed, that the air may depart into nourishment for the vitall spirit, but that it may be connexed with it, being sucked to it thorow the Arterial Vein, and Venal Artery of the Lungs; and that the air being for this cause transported into the heart, it may receive a ferment; which accompanying it, they both may dispose the venal blood into a totall transpiration of it self. After another manner, many things are made fixt, and do resist a breathing forth, if they are provoked by heat, otherwise, they were in themselves volatile: Wherefore an *Alkali* is not generated in ashes by the fire essentially, although effectively it proceed from thence: For the office of the fire is indeed to kindle, consume, and seporate, yet not to produce any thing.

Seeing the fire is not rich in a seed, it is the very destroyer of seeds: But from seeds all Generation proceedeth: When therefore an *Alkali* is fixed out of a Salt that was before volatile, it is not a new production of a thing, but only the Alteration of a thing: For the *Alkali* was indeed materially in the composed body before burning, and did flow together with its *Mercury*, and *Sulphur*: Notwithstanding while the fire takes away the *Mercury*, and *Sulphur*, the Salt indeed as being a principle more subsisting in the melting of the combustion, doth snatch to it self the neighbouring part of the *Sulphur* or *Fat*, and when it is not able sufficiently to defend it from the torture of the fire, it partly also flies away under the mask of a Gas, and attains the odour of corrupted matter, and is partly incorporated in the laid-hold-of co-melted *Sulphur*, and is made a true Coal: Wherefore the *Sulphur* being now fixed by the wedlock of the Salt, it doth not speedily incline from a Coal into a smoaky vapour: But by degrees, and not unlesse in an open Vessel; and so with the former *Sulphur* (for from hence the *Sulphur* of a thing being for the most part sharp, doth retain the savour of a volatile Salt) and at length, with the Coalie *Sulphur*, the just weight of its volatile Salt flies away: Which thing surely is no where more manifest than in the Coal of Honey: For if this be urged or forced by a shut vessel, it remains not changed in a bright burning fire; but the vessel being open, both do so depart, that moreover, no remainder of ashes doth ever survive. Therefore the *Alkali* Salt doth fore-exist materially in the composed body, before combustion. Because all the Salt was formally volatile in the composed body, and not in the form of a more fixed *Alkali*, which thing is now especially manifest in the blood; which being wholly volatile, exhaleth unsensibly through the Pores without any residence: But if it be combusted or burnt, it leaveth very much fixed Salt in its own ashes. In the next place, The wood of the Pine-Tree, which affordeth little ashes, and less Salt in the preparation of ashes barrellted, is by calcining wholly turned into an *Alkali*: For barrellted ashes are brought to us out of *Scandia*, called *Weedaschen*, combusted for the most part out of the Pine, and some out of the Oak, which do infect the Hogs-head wherein they are carried, with a more moist aire, to wit, with a melted Salt: Therefore the woods of the Hogs-heads being thus salted, when they are burnt, they melt like Horn, and do almost wholly degenerate into Salt: for part of the ashes also is made a Salt, by reason of the contained Salt, which afterwards they name *Potaschen*: For else, the ashes of the same wood, the Salt being taken away, do remain ashes, and are not made Salt. Whence indeed it is manifest, that the Salt of the ashes doth afterwards make a Salt like to it self by co-melting, and that indeed a fixed one: And therefore there doth arise a fixedness in the composed body by reason of the Salt, and co-melting, which otherwise doth not exist. So when *Tartar* of Wine is burnt, sixteen Ounces of it doth scarce yield two Ounces and a halfe of *Alkali* Salt: therefore thirteen volatile Ounces and a half have perished in the calcining: Yet if these are distilled, and are at length imbibed in their own remaining Coal, they will as yet yield four Ounces and the third part of an Ounce of Salt, by co-hobating. Therefore what thou seest to be done (thy self being Judge) concerning the four Ounces and a third part, judge thou the same, touching the two Ounces and halfe of the former *Alkali*. Hitherto doth that belong, which I have elsewhere spoken of *Aqua vita*, being fixed in the *Alkali* of *Tartar*, and the same thing happens in distilled Vinegar. Hence there-

therefore it appeareth; that the volatile Salt of a thing is fixed in its own fixed *Alkali* or Salt. Yea like wine, that the whole ashes was before, volatile; and fixed, under the first co-melting of combustion: But that the volatile Salts, which were nigher to their Essences, departed together with their Essences, in the first torture of the fire. Yet note, that although an *Alkali* be made of the spirit of Wine in the fixed Salt of the *Tartar*: nevertheless, as the Salt of the *Aqua vita* was changed by the Wedlock of Essence, yet one is to be separated and distinguished from the other in the univocal or single fixedness of them both; As the *Alkali* of the Spirit of Wine being powred on *Aqua fortis*, becomes red, but the *Alkali* of *Tartar* doth not change its colour.

40 Wherefore also there is among *Alkalies*, their own Common-wealth, and the Adulteraters of money do labour very much about Salt of *Tartar*, the *Alkali* of *Salt-peter* being contemned. Also an *Alkali* Salt being prepared, as is here said of the Spirit of Wine, doth by the joyning of it self, change the Savour of the *Lixivium* or Lie of *Tartar*: So as that it becomes the astringent Balsam *Samech* of *Paracelsus*; the which, before it had the Savour of a *Lixivium*, was an expert Balsam, and did resemble a Cautstick on. At length, hitherto that suits, that rotten and putrified Woods do scarce leave a Salt in their ashes; Because the volatile Salt departed with the Sulphur, through a Ferment of putrefaction: And so, there was at least, as much volatile Salt in the thing or composed Body, as is found to fail in the ashes; that is, the whole: whence it followes, that the volatile Salt fetched as well from the *Sulphur*, as from the *Mercurie*, is materially the same with the Alcalized or fixed Salt.

42 And therefore a volatile Salt is fixed, and likewise a fixed Salt is made volatile, the formal property of the composed Body remaining. Again, it followes, That the *Sulphur* of a composed Body being distilled, and the *Sulphur* of a Coal, are of the same particular kinde, although this be imprisoned, but that is free.

43 Truly Handicraft-operation taught me these things; after that I knew how to separate the three things from ordinary composed Bodies, without a corruption of matter, I learned that every combustible Body hath in it a volatile Salt, which by the snatching of its own *Sulphur* unto it, is fixed into an *Alkali*. In the meantime, that part, for the most part aboundeth, which escapeth the embraces of the co-melting volatile *Sulphur*: In which co-melting, the action springs into the *Sulphur* of the thing: Which, understand thou by an example of distilled Vinegar.

44 This I say, seeing it is water impregnated or got with childe of a sharp volatile salt, if it shall through the action of its sharpness touch any thing by biting, it is straightway coagulated, which afterwards by combustion, is found to be a fixed *Alkali*. Yea, if the sharp and volatile Spirit of Vitriol shall corrode a *Mercurie* alike volatile, the sharpness of the Vitriol is fixed into a true Alume. Which Handicraft-operations, I do moreover shew, in drawing them to the scope of a torall consuming in the Venal Blood.

45 If the Air (let him who can, comprehend the secret) doth in the first place, volatilize the *Sulphur* of the composed Body, with the every way separation of its Salt, this Salt (which else in the Coal, should be fixed into an *Alkali*, by the fire) is made wholly volatile, and climbs upwards, sometimes in a liquid shape, and oft-times, in the form of a Sublimate, and hath the whole constitutive temperature of the composed Body. This Salt is demonstrated by Handicraft-operation; but its demonstration is known to few, although it listeth us to make it plain. At least, it from thence appeareth, that the true use of the Air in the Pulse, and breathing, was not made known to the Antients, by reason of the ignorance of the Art of *Alchymie*. Likewise from thence it is manifest, that from a continual necessity, the Air is drawn inward for a peculiar end, that it may cause the blood of the veins (else through our heat not to be discussed; but rather to be condensed) to be plainly volatile, without the remembrance of a remaining dead Head. But in Fishes, as the venal blood is not stirred by heat, but onely by the vitall Ferments of the parts; So neither was there need of breathing: For truly those living Creatures might freely want breathing, whose venal blood wants the fear of heat: Because it is a thing unseparable from heat, that the more watery part of the venal blood being exhaled, the remainder doth wax clotty, and at length doth degenerate into a dry lump, unless by the uncessant attraction and Wedlock of the Air in the Bride-bed of the Lungs and Breast, the Air it self should be co-mingled with the sulphur of the blood, it being as it were the seperater of the waters, and should bring forth the sulphur changed in its last essence, and breathed thorow the pores, together with a watery vapour, by an unperceivable Gas.

46 That was not a naked office of cooling refreshment (although it be in the Schooles so thought, who are wont to measure all things by heat, and cold) but the vitall Ferment of the *Arteries* being adjoynd (for this cause perhaps, and that especially, the *Arteries* do accompany

pany veins thorowout the whole Body) there was need of a greater moment and necessity: And so, that neither is [the Pulse any more to discuss or puffe away the smoakie Vapours of the venal, than of the arterial Blood, nor of this more than of that, but it meerly especially serveth (besides the framing, enlightning, and continuation of the vital Spirit) to prepare the arterial blood in to an expiration, without a dead Head: which thing indeed, is altogether requisite to nature: Not indeed to chase away smoakie vapours bred by heat (although no smoakie vapour doth properly exhale out of moylt Bodies) but rather to hinder, least by the ordinary endeavour of heat, vapours (which they undistinctly call smoaks) should be bred: Or by speaking more properly, least vapours departing out of the venal Blood, the other part of the venal Blood being thickned, should cause a totall destruction.

To which end behold, that the finger being pained, hot, and wounded, presently an unwanted Pulse doth bewray it self in that place, because the Air is hindred from entrance unto the blood there chased out of the veins, and detained in the lips of the wound: And there is a fear, least the blood should grow together, and harden into corrupt matter.

But corrupt matter or Pus being made, that fear is diminished, because it stops in the deed:

For before the wound, a hidden Pulse, straightway a violent one ariseth in the same place, even before heat, or a presupposed smoakiness were present. In like manner also, as soon as any night doth invade the inward membranes, the Artery doth presently after a wonderfull manner, wax hard throughout the whole man, and brings forth a hard, extended, shaken Pulse; yea, and a Pulse like a Saw: But by no meanes (as the Schooles think) that the Arterie is dried, that it may foreshew in the heart, and open to a Physician, the quality and nature of the part affected (which is ridiculous): for nature doth every where intentionally employ it self in the ripenings, promoting, or removing of Causes; but never at all in uttering or setting forth the pathological or sumptomatical Signes, the diagnostical or discernable signes, or prognostical or foreshewing signes: For these are signes by accident, and to be noted and observed by the Physician, besides the intent of nature: For if in the progress of nature, a thing conringent or happening, be drawn into our knowledge, that is unto it by accident, and wholly forreign, which (the Stars excepted) doth work nothing with an intent of foreshewing: But whatsoever it doth, that is by a Command, which is the natural endowed property thereof. The Artery therefore, doth not produce a hard Pulse for that it self is made more withered and dry; because there should never be any hope, after the dryness of the membrane, of a softer Pulse; as neither of a re-moystning of the part once dried up. Old Age it self, being dry or withered, and without juyce, is a witness. Neither lastly, doth the Pipe or Trumpet of the Artery wax hard for a sign, but for the cause, end, and meanes of another intent: to wit, if the lesson of the Schooles be true, that the Arteries do beat to the end that they may draw Air which refresheth or cooleth the heart. Surely, if they were alwayes mindful of that their own Doctrine as they ought, the Arteries should at least by that hardness of extention, more fitly breath in Air; Seeing otherwise a soft Artery, doth by attracting fall down, it creeping, and being watery, slides on it self, and so that its mouth, which in the hardness, gapeth, in the looseness, is closed.

Therefore a hardned Pulse doth betoken a contracted Artery, but not one that is dried up: For if the Pulse should be uttered to this end, that the defect and quality of the parts should be bewrayed; Surely in an Apoplexie there should be a most soft Pulse (because the Brain being wholly a marrowie part, shall be concluded to be offended) which at the same time is alwayes hard, and strong: So also the breaking of a Bone should make the hardest Pulse of all: And corrupt matter being now made, the Pulse should be more great, and frequent, than while it is making:

Because the fore-going labour hath brought forth a want of Spirit, and the present corrupt matter or putrefaction doth want a speedy discussion. Likewise in an enflamed tumour or a Phelgmone, the contraction of the Pulse should be more fit or due, and far more manifest than the dilating thereof: which things, seeing in the truth of the deed they are not so, the Schooles must needs have erred in the ends of the Pulses. And moreover, the Coat of the Artery, at the coming of sweat, however it was before, harder, it again waxeth soft: to wit, seeing there was a greater necessity of expelling smoakiness, than of attracting Air. I say the Artery ought to be both spreading, and more hard, with a frequent pressing together; but not to fall down with a great Pulse, more slowly, after the manner of waters. At length, in affects of the Lungs, the neighbouring cords being on every side filled with so many veins, arteries, and gristles, the Pulse is loose and watery, and in the vomiting of corrupt matter, with some kinde of intermission: The Lungs I say, being opportunely importunate in its own expulsions of smoakiness, should want a most hard, extended, and strong Pulse. Whether per-

haps is the double Coat of the Artery, now besmeared with a future sweat? Doth it hitherto wax moist with a strange moisture? or else is it void of moisture? whether it doth retake its hardness after the hour of sweat? and shall almost recompence at pleasure its own driness by a successive or cursary softness? For how full of weakness are the medicinal speculations of the Schools? For truly in the aforesaid affects of the Lungs, a most loose Artery, and watery Pulse do plainly shew unto us, that breathing is given for the service of the breast: For nature is conscious that there would be no need of a provoked Pulse, as neither of an extended Artery, when as breathing hath undertaken its office, first for the breast, and consequently or secondarily for the rest of the body: by that very thing is shewn us, that the use of breathing was chiefly appointed for another end, and over another part, than for and over that which the Pulse is. As oft therefore as there is need of very much aire for the blood dispersed thorow the Veins, to volatize that which threatneth to be hardened, so oft doth the Artery strain, extend, and contract it self, but is not dried: But that air is attracted, not for the nourishment of the Spirits, or the expelling of smoaky vapours; But altogether, that (as that which is in it self the seperater of the waters from the waters) it may adde a spur to the Ferment of the last Digestion, that after the performance of its offices, it may expell the whole nutritious liquor, without any residing remainder of it. Therefore the in-breathed air is serviceable to this Ferment, not for cooling or refreshment, not for the food of the spirits, as neither for the Bellows of smoaky vapours: For otherwise, the looseness of the Artery is incapable to breath-in sufficient air. But the future and prepared sweat, seeing it is already in it self volatile, and presently flowes forth in manner of a Latex, or Liquor, it doth not require very much labour, nor hardening of the Artery: for the strength decaying, the Pulse is watery before it be creeping. Because nature being weakned, doth not any longer meditate of great labour: but an Apoplectical Pulse is the chief and most hard of the Pulses, by far and especially a little before death. The Schools will have that to come to pass, because there should be the same, and an individual necessity and end of the Pulse and breathing: *As (they say) the heart will recompence the defect of breathing.* But the swooning of Virgins in the affects of the womb, whose breath is stoppt, and their strength strong (for from thence they do for the most part rise again) have their Pulses very small, for a reproof of the foregoing Doctrine. So likewise the Pulse of those that are diseased in the Lungs, is watery, and feeble, for whom notwithstanding nature ought to be diligent in supplying the penury of breathing. But why in an Apoplexy, the Pulse is hard and great, we must search it from the nature of a disease, which I will at sometime profesly touch at in a Book, and that of the disease of the Stone. Now for the neernesse of the matter, I will explain two Aphorisms.

- 52 The first whereof is; *While Pus or corrupt matter is made, the labour and pain is greater than when the Pus is made.* Every Aposteme ending into corrupt matter, doth necessarily contain a sharpnesse, which forceth the Venal blood into a clotty Lump: And therefore it is afterwards incapable of transpiration. Wherefore nature moveth every stone, and stirs up the Arteries and breathing, that the Ferments by aire may hinder such an effect: And at length she profiting nothing, ceaseth from that endeavour: For the venal blood is troublesome to nature, not only as it waxeth clotty, but as it containeth some forreign thing (for else an Aposteme should not be made:) for it is the property of sharpnesse to coagulate or curdle every immediate nourishable thing: from hence corrupt pus ariseth. Therefore Hippocrates spake more rightly than Galen; *Diseases are not hot, or cold, &c. but soure, sharp, bitter, and brackish.* For a wound as soon as it feeleth corruption, its lips do swell, and corrupt Pus is made, unless a more violent force do compel a worse thing, or the thin matter sanies to wax duggy or curdy: But the corrupt pus is called by Idiots, *A good digestion of a wound*; that is, more rightly to be reckoned a less evil: but if the wound be new, and fenced by Ballam from corruption, corrupt pus happens not thereto: But when a sharpnesse, the token of putrefaction, doth contract or draw the Bottom or Lips of the wound together, corrupt matter is made: For worms are oft-times plainly to be seen in wounds by reason of corruption. In Kitchins, if fleshes do begin to corrupt, their broaths do wax soure.
- 53 Wherefore every vulnerary or wound potion, ought to contain in it a hidden *Alkali*, and indeed a volatile one, if it ought to resist the accidents that sprang from the corruption of tartness: In as much as every *Alkali* doth slay all sharpnesse which it toucheth: For so indeed, the stone of Crabs is a provoker of Urine, and vulnerary; which is manifest enough: For it being steeped in Wine, doth after a dayes time savour of a *Lixivium*.
- 54 The other Aphorisme saith *Bellies are by nature hotter in Winter than in Summer.* Truly *winter* sounds or imports hollownesses, not bellies. It is a suppositive Aphorisme, not agreeable to its neighbour ones, nor agreeable to the Genius of the old man. In the first place, It is

is false. Again; for in Winter I eat hot things, likewise, I do not drink cold things; yet after food I am cold within, none whereof I feel in Summer: For in tangible things I take the touching to be Judge. The Schools excuse themselves and say, *That the outward cold drives our heat inward, whence there is a more plentiful digestion.* First of all, I have sufficiently taught elsewhere, that digestion is not from heat. And then, after meat cold is more felt within, in Winter, than in Summer.

I confess indeed, That all heat is from the vital spirit of the Arterial blood: If therefore by cold, the spirit be driven inward with the Arterial blood, there shall be perill of choaking, and the Pulse should give a token, if smoakiness that are to be expelled, do import the use of the Pulse: Likewise the Pulse should be greater and swifter in Winter than in Summer, If the supposition of the Schools be true: But the consequent is false; therefore also the supposition. But if they will have heat to fly inward alone without the Spirit; Now they shall against their wills admit, that the same accident doth wander through subjects. At length, which way should heat go inward unto its own fountain? And indeed should that be done generally in all, at Winter? For whether a sound heart, which by reason of the abundance of heat, and fear of smoakie vapours, should beat from a continual necessity, shall not be able by reason of Winter, to provide it self of a sufficiency of heat? or why doth it not rather cease in beating, than that it should by reason of an ordinary want, repeat or renew the heat dismissed from it? The Schools after their manner, leap over these things with a light foot: for they say, *That a greater quantity of nourishment is consumed in Winter, than in Summer, by reason of the abundance of heat:* And again, they divine a more plentiful heat to be in Winter, from a want of the more nourishment: For the same thing, and that in the same respect, should be the cause and effect of the same thing: The father and the son, before and after, in respect of themselves. But I blame the air, which as oft as it is colder, is also nearer to its own natural quality, and a more potent seperater of the waters: And so, by how much the air is colder, it doth the more volatilize the venal blood into a Gas: No otherwise than was said concerning Sailers. Otherwise, the dreams of the Schools do vanish, as to the heat of hollow places and Wells, by an instrument meting out the qualities of the encompassing air. And likewise as concerning the belly of man, if it live in a somewhat luke-warm Stew: But the instruments of sense cannot exactly distinguish the moments of heat, where there is a six-months interval; because they themselves remain subject to the alterations of seasons. Therefore also the application of sensible objects, to the instrument of sense, is at a different station, deceitful. Also stomachs seem more hot in Winter, because we want the more nourishment. Neither is it a wonder because we therefore drink more liberally in Summer; but we are more speedily nourished with drink than with meats. Therefore the use of the Pulses

1. That the venal blood may through the Partition, be transported into the least bosom.
2. That therein, and in its dependent Arteries, the spirit of life may be made of the Arterial blood.
3. That of venal blood, may be made a yellow arterial blood.
4. That it may be informed by the mind of man. Indeed the Arteries are the Stomack of the heart, as the sucking veins are the Kitchen of the Liver.
5. That there may be a continuation of the vital Light throughout the whole body.
6. The Blas of the Pulses is for the framing of heat, but not of cold.
7. That the venal blood being dispersed into the habit of the body for nourishment, may be made wholly capable to be breathed thorow the pores, without a Post-hume or Future remembrance of a dreg.
8. But breathing hath for its aim, only this last use of the Pulse.

At length, I also adde this; That there is not an Animal spirit in nature: Because the change which the vital spirit receives in the Brain, is not unto a formal transmutation, but is a perceptive degree to the appointment of it self. Indeed the in-bred spirit doth intend of a vital influx to generate its own, like to it self, and that in all the particular shops of the senses, and giveth to it the seal of its own instrument: For so the Optick or Seeing spirit doth not taste; yet they do not therefore both differ in the particular kind, although in their own offices: For in the vitality or liveliness of the heart, it is at once quickned by the mind, and is made the universal instrument of that life.

CHAP. XXV.

Endemicks, or things proper to the People of the Countrey where they live.

1. *The Schools have stated whence it was to be begun :* 2. *That the encompassing air is not breathed into the Arteries :* 3. *It implyeth, that the air doth inspire at every turn, and that smoakie vapours are expelled.* 4. *The mutual unsufferableness is demonstrated :* 5. *It would thence follow, that the artery is not lifted up but that it may fall down :* 6. *The end, manner, and possibility of air, attracted by the pulses, should cease :* 7. *That Endemical things are drawn by breathing :* 8. *That vapours are not drawn inward by Ointments.* 9. *Its own generative vertue is wanting to the vital spirit.* 10. *The humane Load-stone of Paracelsus is a fiction.* 11. *That no smoakiness is to be granted in the heart and Arteries :* 12. *That the whole knowledge of the Schools by signs or tokens, is polluted.* 13. *The progress of Endemical things.*

1 **I**T is not sufficient to say; That the Mines of Veins do belch forth the wild Gas of a hurtful Arsenick, and a metallick malignity; Fens, a stinking vapour; breachy Rivers, and Shores, a disease mist, and a contagion of the soil putrifying by continuance: But by coming nearer, the suitings of causes do every where give understanding to those that search diligently, but neglect to the ignorant or unskilful. For without doubt, man was to dwell in the air, to be thorowly washed round about with the air; yea and to be fed, and to be subjected to the violent tyranny of its impressions, and to the interchangeable courses of its successive changes, whereby the air is the continual seperater of the waters. Therefore the air is promiscuously drawn thorow the mouth and nostrils, into the Lungs in its chiefeest part: But whether the air, and by consequence also an Endemical Being, be drawn inward by the encompassing aire through the Arteries; the Schools affirm it:

2 But I as the first, being supported with the much authority of reasons, and the great authority of truth, have doubted of it: By consequence also, That Oyntments applyed to the places of Pulses that they may be drawn inward, are made void. First of all, These Propositions do resist themselves; The aire is drawn through the skin into the Arteries: And the depression of the Pulses is to drive away smoaky vapours successively raised up by the heart. Because if continual smoakinesses are stirred up by continual heat, and the heart doth uncessantly labour with the Arteries for the expelling of those; Surely there shall be no room nor space of motion for the attraction of the air from without to within.

3 For if there be a successive, continual, and uncessant expulsion of the Pulses from the center of the heart by the Arteries; of necessity also, the whole Channel of the Arteries shall by a continual thred, from the heart even unto the skin, be filled with a smoaky vapour; of the expulsiog of which smoakiness, seeing there should be a greater necessity, than of attracting air (for fire is most speedily extinguished by smoaks, but doth not so soon consume the whole, through extream want of cooling or refreshment) there is no leisure for the attraction of the air. And moreover, the Pulse being stirred, the attracted air, and that in the least space of delay, should be besmeared, being involved in smoakiness, so also the aire in the smallest branches of the Arteries, that it should rather increase the use of expulsion, than satisfie the cooling refreshment of the heart. Therefore the supposition of smoaky vapours standing, the air is in no wise drawn by the Arteries from without to within; and so the Schools do unadvisedly dictate their own, and yet do subscribe to each other.

5 And moreover, it follows from the same supposition, that the Artery is not lifted up by itself and primarily, but that it is only principally elevated that it may fall down; next that by that endeavour it may shake of the fardle, and drive away the fear of choaking; seeing that should be the chief end of the Pulses, but the other which is that of cooling refreshment, is in respect of the former, a secondary end. Again, If the Arteries should suck the air inwards, to what end I pray, should that be done; seeing the sucking of the more crude endemical

demical air should rather hurt than profit? For not for the cooling refreshment of the heart; seeing all the Pulses should scarce allure the smallest thing from the air, by the least and utmost mouths of the Arteries, which being the more swift in drawing, should not straightway afterwards be expelled by the depression of the Artery: yea it should so most speedily in that very moment be co-united with the smoaky vapour, and made hot by the Arterial blood, that the heart should not feel in it self any cooling or refreshment thereby: Especially seeing the air should not by one only attraction, proceed that way from the skin to the heart; but by a manifold depression of the Artery coming between, it should wax so hot in the way, that it should deceive all hope of cooling refreshment. Wherefore if the Arteries should allure the air from without the elevation of the Artery, should of necessity alwayes far exceed its depression in swiftness & greatness; which is abusive: As also, that the air should keep the quality of a cooling refreshment undefiled, being introduced by little and little, through so many windings of the Arteries. In the next place, neither should the Artery draw the air, that the vital spirit may take increase thereby: Because with the consent of the Schools, the vital spirit is not made of air; but of the vapour of the venal blood elaborated in the heart to the utmost, and ennobled with a vital faculty: And it is a dull affirmation, which supposeth the vital spirit to be nourished by a simple Element: Seeing *we are nourished by the same things whereof we are generated*. Wherefore seeing the in-drawn aire is an elementary body, it hath not the nature of a sanguine spirit; as neither seeing the air can ever be made individual by a humane determination, it shall not be able to nourish a composed body, as I have taught in its place.

Moreover, It alwayes keeps the properties of a universal Element, but doth not attain the condition of an *Archens*. For the aire is neither akin to us, nor is it capable of a vital light: And therefore the Artery shall abhor a Forreigner, neither doth it admit the air into its family, before it be elaborated in due shops; neither doth nature attempt any thing in vain, as neither to prepare the aire, that it may be made that, toward which it plainly hath not a possible inclination: otherwise, the vital spirit should be made in vain, through so many preparations of digestions, long-windings, and shops of the Bowels, if by so light a breviary, and without usury, it may be ripened from without. For this hath deceived the Schools, that it hath hitherto been believed, that fire is necessarily nourished by air: Therefore also that vital spirit as the Authour of all our heat, doth want for its food, the Element of air. But I have already cleared it up above, that the fire is neither a substance, nor that it is nourished by air: Yea, neither by a combustible matter, unlesse that in hastening to the ends of its appointments, it doth require an inflammable matter for its object, but not for its nourishment. Also for want of an object, it perisheth in an instant, when it hath attained the end of its appointments: Because, seeing it is neither a substance, nor an accident, it also perisheth for want of an object; for that its own object is also its subject.

And so also, that is a thing most singular to it, and hitherto unknown. Therefore the supposition of smoakie vapours standing, the end ceaseth for which the outward Air should be drawn through the Skin into the *Arteries*, the manner ceaseth, and the possibility ceaseth. Again, if the *Arterie* sucks the *Air* by the Pulse, it should indifferently suck; and such an attraction should be promiscuously endemicall, and so, hurtfull: which I have observed to be false by often experience.

Especially, because that as oft as a forreign or strange Plague is contracted from without by the breathing, the suiting or setting thereof is not made but nigh the stomach: which thing is made manifest by the sense of the place, anguishes, vomiting, sighs, head-aches, and doagages: And so that part in us which feeleth, and formeth the first motions of apprehensions, doth also feel the first onsets of the Plague. I grant indeed that the Plague is contracted by the contraction of a defiled matter, and that forthwith the pain as it were of a pricking needle is felt: But this doth not prove, that therefore the sucking of the *Air* is made by the *Arteries*; when as the poyson it self is apt to infect the skin, and forthwith to burn it into an Echar. Surely it is a far different thing, for the Pest to be drawn inwards by the *Arteries*, or to be allured by sucking; and another thing by force of its own contagion, to creep inwards by touching, as it were by the stroak of a *Serpent*: for emplasters, Baths; and Oils do alter the skin; and consequently, they do either proceed to alter, or do draw from the Center to the skin: but not because vapours fetched from thence, are drawn materially inward.

Then at length, the Pulse is not after the manner of breathing, which by one sigh doth blow out whatsoever is of *Air* in the *Breast*: but the motion of the Pulses is interrupted by an opposite; and therefore the expiring motion is most frequent, no lesse than the inspiring; and those successive motions do so much hasten, that if they had attracted any *Air*, that should enter for a frustrate end, seeing it would be knocked out in an instant: For truly, that which

is nearest to the mouthes, that should also first be blown out: And so the *Air* should not have hope, ever to be more thorowly admitted, or that it should satisfie the cooling refreshment of the heart.

9 Lastly, a generative faculty is wanting to the vital Spirit, whereby it should bring the *Air* into Spirit by a formall transmutation; Seeing that power belongs to the Ferment, and Shops, without which, venal blood is not made: For neither can venal blood generate venal blood, and the chyle of the stomach being granted to be in a *Vein* or *Arterie*, venal blood should not therefore ever be made thereby, or arterial blood. Therefore the *Air*, although it should be a fit Body, yet it could not be made the nourishment of the vital Spirit, unless it had first been elaborated in the heart, being quickened and enlightened therein individually, according to a humane Species: all whereof do resist an Element.

10 Therefore the frivolous device is made void, and the cooling refreshment of the heart by the attraction of *Air* inwards by the *Arteries*, is feigned: And the Load-stone of Man celebrated by *Paracelsus*, is feigned; Seeing the *Arteries* do not suck inwards, and the *Air* so introduced, should be for a greater load to the *Arteries* than the feigned smoakie vapour of the Schooles. If therefore the *Arteries* do not draw *Air*, certainly much lesse should flesh do that; being an enemy, wanting the hollowness of the *Air*: For indeed, that the *Air* is drawn from without unto the heart by the *Arteries*, as well for its cooling refreshment, as its nourishment, and increase of the Spirit of the *Archeus*, is nothing but a meer device.

11 So is the invention of the Schooles alike frivolous, that the necessity alone of expulsi-
 the smoakie vapour bred in the heart, should depress the *Arteries*; For truly in the foregoing Chapter, I have already shewen at large, that there are other aims of the Pulses: For whatsoever is made in the heart, is either a pure Being, and a meer refined thing, and vital: For there is no adustion, corrupt matter, dryth, nor efficient cause of smoakiness: For it is an unsavoury or foolish thing, thus to have compared the Fabrick or frame of life to destroying fire, that it must be feigned, the arterial blood there to be burnt to, and to send forth smoakie Fumes: For if any forreign vapours do sometimes besides nature disorderly touch the limits of the heart, we straightway feel the numbers of beatings, and the defects of intermitting storms. But if an ordinary framing of smoakiness should be in the heart, how should they be separated from the vital Spirit? and by what trench should they remain divided from each other? How should the expulsion of smoakie vapours be possible, which should nor also abundantly power forth the vital Spirit most intimately co-mixed with themselves? And so, as the Schooles have nothing of pure Doctrine, do they also suffer no unpolluted thing, no undefiled thing without an excrementitious and dungie smoakiness? do they think that the essential offices of life do indifferently belong as well to a smoakie vapour, as to the Spirit of life? And so hitherto also to be co-mixed? How should the depression of the *Arterie* thus far tend unto a good end, and that appointed by the Creator, which together with the smoakiness, should also puffe out the vital Spirit thorowly mingled with it? And so shall it forthwith bring death and destruction? How had not that *Umpire* of things, most highly to be honoured, even from mans Creation, made death by the contraction of his Pulses? Last of all, if a smoakie vapour should be the Musical measure of the Pulses (as they will have them;) what should be that seperater, who should compel the smoakie vapours rather to depart into the habit of the flesh from without, than thorow the chief *Arteries* with a straight line, into the head? Or if a co-mingled smoakiness doth indifferently hasten with the vital Spirit into the bosoms of the Brain, why do they not continually disturb the Family-government of the Senses? what if the pressing together of the *Arterie* be dedicated to the expulsion of smoakie vapours; for since the *Arteries* are thumped sideways, so also thus far they do bestow Spirit and vital Powers on the places thorow which they passe: therefore that way also they should mutually expell smoakiness: which surely should be more pernicious to all the Bowels, than to the *Arteries* themselves, because these are judged to be refreshed by fresh *Air*, but not the Bowels. If therefore they will have smoakie vapours expelled by the pressing of the *Arteries* together, let them first shew us that smoakie vapours cannot be otherwise purged, than by the last or utmost mouths of the *Arteries*, and that with the continual safety of the Spirit that is thorowly mixt with the smoakiness. Truly, the Schooles do support their defiled Doctrine by a smoakie vapour, and by a blinde perswasion of sluggishness do subscribe their *Genius* unto *Galen*.

12 Seeing therefore they have been ignorant of the matter, heat, residence, content, and circle of the Urine, but have passed by the efficient cause of Pulses, but have fled back chiefly to heats and colds, and have neglected their true ends, the whole significative knowledge of healing hath remained polluted: Therefore the Schools are prophesied of as it were from

a three-legged stool, as well in the knowledge of Diseases, as in the progress, and end of the same : which thing I shall hereafter, much more plentifully prove.

Therefore Endemical things do affect or stir all things whereby, and which way they enter : to wit, the Head, Breast, and the Dependants on these : And by how much they do prevail, by so much do they operate and effect : For some do imprint a spot or defilement on the part, and afterwards depart : Such as are misty or cloudy things, stinking things, things purified by continuance, &c. But some do enter in the shape of a smoak, and are breathed into *Minerals*, which are again divers wayes coagulated within : For some are spewed forth spittings, if they are not hurtfull : But others do for terme of life roughly adhere on the walls of the pipes of the Lungs, and do exercise their tyranny for their entertainment. Of this sort, is, whatsoever doth fume out of the veins of *Minerals* : wherefore also the Fume of *Minerals*, by reason of its malignity, & an Arsenical poyson, have become *Synonymalls* or things of one name : to wit, the *Arsenick*, and smoakie vapour, and smoak of *Metals* fall together or agree in one : Whence are hoarsnesses, tremblings of the heart, faintings, *Asthmas*, *Pleurisies*, Inflammations of the Lungs, Coughs, spittings of Blood, Consumptions, Imposthumes full of matter, &c. In the mean time it is not manifest, that *Endemicks* or things proper to people in the Countrey where they live, are drawn by the Arteries, neither that the same are immediately affected : But if *Mercury* doth bring forth tremblings, that at least is impertinent to the Arteries. Neither also do they therefore tremble, into whom *Mercury* is driven by Ointments : But they are bladdered in the mouth, throat, the Uvula falls down, and their teeth are ulcerated, do shake or are loose, and wax black, their head swells, and they spit stinking things greatly. Also *Guilders*, *Diggers* and *Seperaters of Mercury*, because they do inspire a deadly poyson into the head, and Sinnewy parts, they do work or effect *Endemicks* in us as much as they can.

CHAP.

CHAP. XXVI.

The Spirit of Life.

1. The Doctrine of the Antients concerning a threefold Spirit: 2. They have stated whence we must begin: 3. The spirit of wine doth contain onely two Chymical Beginnings, flexible at the pleasure of the Artificer. 4. Vital spirit out of spirit of wine. 5. How drunkenness comes. 6. How the spirit of wine, and Aqua vitæ or Water of life do differ. 7. Whatsoever is stilled onely by fire, doth go back from the virtues of its former composed body. 8. The ferment or leaven of the stomach, and of bread, differs. 9. The Plurality of ferments. 10. Gas being unknown, hath brought forth many absurdities in the distinction of things. 11. The soul is in the Arterial blood, and not in the venal blood: 12. The Venal blood is without a spirit of the Liver. 13. Drunkenness. 14. The progresse of the vital spirit through its offices. 15. The declared disposition of the spirit it self. 16. What things are by sense reckoned to be one, are severed or discerned in their effects. 17. From whence the spirit of life is Balsamical. 18. The spirit of Aqua vitæ only by touching, looseth its oiliness. 19. It is presently made a Salt. 20. The whole venal blood is turned into a Salt. 21. Of the life of the vital spirit. 22. The light is now and then extinguished in the matter of the spirit. 23. There are as many particular kinds of sublunary lights, as there are of vital lights. 24. The definition of the vital spirit. 25. The heat of life is not the Constituter of its own moisture. 26. That heat is an adjacent to life. 27. The undistinction of the Schools, of the effects of heat, and of a ferment. 28. Whence heat is Escharotical or the maker of an Eschar in us. 29. Whether the animal Spirit be distinct from the vital.

I Have discoursed already before of the *Archeus*, as it were the Vulcan in the seed, and after what manner he may dispose of all things; as well in generation, as in the transmutations of meats, throughout the course of life; which office doth properly respect the inbred or implanted spirit: But now, how, and whence the spirit floating in the Arteries may be constituted by occasion of the Blas of man already described; consequently I have undertaken to explain in this path, their Office, and Properties.

I The Schools teach, That nourishments are first changed into Chyle, and then into digested juice and venal blood, and so that a certain naturall spirit is made in the Liver, which afterward by a repeated digestion of the heart, is changed into vital, and at length is in the Brain made animal or sensitive, so as that the natural spirit is ordained for nourishing of the parts, but the vital for the preserving of the same, and the animal for the functions of sense, motion, and the soul. But I think it hath been far otherwise Phylosophized, and farther proceeded: For they had known out of Hippocrates, That a certain spirit is that thing which causeth violence, or maketh the assault. But it was not sufficient to know, that there is a certain Spirit to have told by what instruments it should be made, or what it might act, unlesse they should explain also the disposition, substance, and properties of the same, together with the manner of its making.

2 I have elsewhere delivered, That of any plant, and fruit, a ferment being applyed, *Aqua vitæ* or a water of life may be made; which thing seeing it is commonly known, while out of Grains, Hydromel or Water and Honey, and juices, it frameth a water of life; The Proposition needs no demonstration.

But

But *Aqua vita* is a volatile Liquor, Oylie (as it is wholly enflamed) and wholly Salt (as being sharp, biting; as being detained the longer in the mouth, it burns the upper skin of the gums and lips) and is one and the same simple thing, and so it containeth two only, and not the three Chymical Beginnings: So indeed, That according to the will of the Artificer, the whole *Aqua vita* may be made Salt, or Oyl, that is, That those Beginnings are not Beginnings not constant things, but changeable at the will of man.

But the Wine as to its Winie part, contains a spirit answering to *Aqua vita*: For this is snatched through the Arteries of the stomach unto the head, without the maturities of other shops. 4

So that if more wine be in the stomach than is meet, drunkenness follows, as the spirit of the wine doth flow more largely into the head, than that by a fit space or interval; it can be changed by an individuating humane limitation: For from hence the changing, and likewise the operation of the ferment is manifest. 5

Notwithstanding, in Wine, that spirit is milder than *Aqua vita* which is drawn forth by distillation: which thing appears from the like in Oyl of Olives: For the Oyl (which they call Oyl of Tiles or Bricks, or *Oleum Phyllosophorum*) being distilled, doth far differ from the Oyliness which is drawn out of simple Oyl, by digestion only with the circulated Salt of *Paracelsus*: for that circulated Salt is separated the same in vertue, and weight, after it hath divided the oyl of Olives into its diversities of parts: For a sweet, and twofold Oyl is separated out of oyl of Olives, even as a most sweet spirit out of wine, being far severed from the tartness of *Aqua vita*. 6

Whence I have learned by consequence, That whatsoever is distilled only by fire, doth far recede from the vertues of the composed body. But in us, although meat doth putrifie after its own manner (to wit, if that putrefaction be a mean of transchanging a thing into a thing) yet in our digestions, by that putrefaction (I speak of the action of the ferment of the stomach) *Aqua vita* is not extracted out of Potherbs, Graines, Apples, or Pulses: For truly, the intention of nature is not then to procreate an *Aqua vita*; and there is one ferment in us, whereby things are resolved into Chyle, and another whereby things do send forth an *Aqua vita* or a water of Life out of themselves: For while herbs do putrifie in water through a ferment, the stalk, stumps or stocks, and leaves do remain whole in their ancient figure and hardness for the extraction of *Aqua vita*, which being eaten by us, are turned into Chyle and loose their first face. 7 8

Wherefore I have comprehended as many varieties of putrefactions, and as many dungs of one bread different in the particular kind, as there are particular kinds of living creatures nourished by bread: Yea, further, far more ferments of bread, because bread doth putrifie as yet by more means as well of its own accord, as from an appointment: But what is spoken of bread, as much is said of other meats. The Schools indeed knew, That nothing doth profit us, which should not contain a Beginning or Essay of life in its root (and so therefore they do admit of the air for the increase of spirit, being deceived by the Lessons of Poets, who call them *Vital airs*) to wit, they would have in the venal blood, a spirit of the Liver, naturally actually to be, and to glister like air. 9

For they thought it to be a vapour; being ignorant that a vapour is never made an uncoagulable Gas, an air, sky, or wild exhalation; but that it alwayes remains water. Therefore they thought a vapour exhaling from the venal blood, hunted outwards (even as out of a certain luke-warm Liquor) should be that spirit of the venal blood, whence vital spirit should be materially framed. But surely the venal blood, as long as it flowes in the vessels of the Mesenterie and Port vein, is void of spirit; Wherefore it being also called out by laxative Medicines, it is voided forth stinking, without any notable token of weakness, which comes not so to passe, if it hath once well touched at the hollow vein: Because then the venal blood is Homogeneally or after one and the same kind sealed in its entrance, that it may be made the blood of the Artery, and spirit; and therefore it is in the Holy Scriptures indifferently with the Arterial blood, called a *Red spirit*, in which the Soul inhabits: 10

Although that be properly understood of the Arterial blood; Because the Scripture is there speaking of men stabbed or slain, whose venal blood is poured out, together with their arterial blood. I shall at sometime reach concerning digestions, that whatsoever is made or composed in the stomach, that doth wax sower there by a ferment, (also Sugar it self, not indeed with a fownesse or sharpness of Vinegar, Oyl of unripe Olives, Citron, or Vitriol, but by its own like ferment, and with a specifical fownesse, although it symbolizeth or agreeeth with other sower things, in that which is sower: Yet the sharpness is diverse from them all by an internall power. And that fownesse of meats is perfectly volatile: Neither doth that hinder, that the Chyle in Youths doth assume the fixedness of a bone, as also in the 11

fractures of bones: For the Chyle of the stomach is the same after growth, as it was in a Youth: But all that is at length dissolved without any remainder of it self: it again retakes the nature of a bone in a callous concretion in the solidness of fractures: And therefore for that very cause all Chyle is volatile, and thus far it sometimes doth assume the disposition of spirit in the venal blood: Not indeed because there is a natural spirit in it, and diverse from the venal blood; but rather because the whole venal blood hath obtained a spiritual Character in the promise, *John 5. The water, the blood, and the spirit are one.*

- 12 But I will teach concerning digestions, after what sort that sowness in the Chyle may be transchanged into a volatile Salt, whose excrementitious part is banished with Urine and Sweats. But the very Masse of venal blood, through the fermental virtue of the heart, and assistance of the Pulses, doth passe over into Arterial blood, of yellow, looking reddish; whence it is made vital spirit; And so, is not the air or vapour of the venal blood, but the venal blood it self is brought into arterial blood, and from thence at length into vital spirit. For the Office of the Liver is univocal, and is called *Sanguification*, but not the creation of spirit, which do differ far from each other. For neither do so many, and so diverse Offices belong to one bowell, especially because the rude heap of venal blood, is not yet a fit seminary for the spirits: For it is sufficient for the Liver being enriched with so few Arteries, and a communion of life, that it performeth a true transmutation of the Chyle into venal blood, and a true generation of a new Being. But in the heart, as it were the fountain of life, it is first of all meditated concerning vital Beginnings: For the Venal blood is there extenuated into Arterial blood, and vital air: which two are wholly perfected by one only action, according to the more ready, and slow obedience of the venal blood: For the venal blood is made with the in-thickning of the Chyle or Cream, therefore by the separation of the liquid excrement, or urine: But the spirit is made with the attenuating or making thin of that which is in-thickened: Both which actions so opposite, do not therefore agree with one Liver. But if the Schools will have a natural spirit to have fore-existed in meats, but to have received a perfection in the Liver: But yet it easily expires in things boyled, cocted and roasted: And if any doth by chance remain, that spirit is not the hepaticall or Liverie one of our Family Government.

I confesse indeed, that the Spirit of wine is the spirit of Vegetables, and is easily snatched into the Arteries, as it were a simple Resembler, previously disposed, that it may easily passe over into vital spirit: But from thence the Schools do frame nothing for their spirit of the Liver: For the Spirit of wine is immediately snatched into the Arteries, out of the stomach, without digestion: Neither is it taken as a vital companion by the degree of venal blood; it is also easily from thence gathered, that the vital spirit doth not presuppose a natural one: And what I have said is manifest: For truly, they which suffer fainting or trembling of the heart, do presently and immediately feel the spirit of wine to be admitted into the fellowship of life, for neither then also are they made drunk by much wine abundantly drunken.

- 13 Otherwise, Wine being as yet corporally existing within the stomach, drunkenness doth not from elsewhere proceed, than because the winie spirit is abundantly snatched into the heart, and head, and there breeds a confusion of the fore-existing spirits, it self being a stranger, not yet polished in the shop of the heart. Therefore the venal blood it selfe, let it be the spirit of the Liver, corporal, coagulated into a matter, and subjected to a vital Government: with me it may be so; so that we understand it Rhetorically: to wit, the venal blood it selfe to be an object capable, and a matter that it may thereby be made Spirit. And in speaking Philosophically, or properly, there is no spirit in the venal blood made for it self by the Liver, because the labour of Sanguification, separation of the Liquor Latex, Urine, and Sweat doth employ the Liver: to wit, while those do most swiftly pass thorow the slender Flood-gates of small veins. For the venal blood although it received an entrance of it self in the Mesenterick veins, yet the true generation of the same is made, also the endowments of small threads, and coagulation, under the most swift passage, together with its Whey, through the small Trunks of a hairy slenderness. But if also the generation of spirit, doth moreover employ the Liver: Truly, besides the vain generation of the same, the Liver is to prostrate it self like an Ass, with too much fardle, and plurality of offices: And it is sufficient for the venal blood, that being made a Citizen of the veins, it doth partake of life, and be illustrated with a vital light. Therefore even as by the ferment, and labour of the heart, the venal blood is made arterial blood, and volatile spirit; So a ferment the Vicar of the heart, being drawn from the arteries, they are also made so volatile, that after their consumings they leave no remaining

remaining lees that do go forth with a total transpiration of themselves. Therefore the heart doth frame out of the venal blood, arterial blood, which it fitteth and extenuateth by the same endeavour, and makes so much vital Spirit in the arterial blood, as the grossness of the venal blood, and the resisting substance of the same doth permit in so little a space, wherein it is agitated and shaken together within the bosoms of the heart: yea indeed, neither is it enough to have known the venal blood to be Spirit, also to be brought over into arterial blood, and to grant a vital Spirit, by whose favour it may be informed by the minde, and be made animate; and from hence at length to be translated into the bosoms, or stomachs of the Brain, there to receive the various limitation of Characters; So that it is made motive in the thorny marrow or *Spina Medulla*, as we have seen in the Shops optical or of the sight, which if they are through some error brought to the tongue, they are plainly unprofitable for tasting: Wherefore it comes to passe, that oft-times the fingers are benumbed, some moveable part, looseth (its sense being left) either feeling or motion, for that the parts are bedewed with a strange, and wandring Spirit:

For the Authours of touchings are unfit for motion, and those of this likewise for them: But moreover, it behoveth to have known the disposition of the vital Spirit: For truly, it will sometime sufficiently appear, that of soure Chyle, partly venal blood, and partly salt Urine, and the excrements are made: But that, that excrementitious saltness is a volatile, and salt Spirit, which being co-fermented with Earth, doth at length in part assume the nature of *Salt-peter*:

The venal blood also, doth by distillation afford this salt spirit, plainly volatile, and not any thing distinguishable from the spirit of Urine: Yet I have considered that they both do differ in this essential property, that the spirit of the Salt of venal blood doth cure the falling-evil, even of those of ripe age, the spirit of the salt of Urine not so: Therefore it is manifest that in the Venal blood, a salt and volatile spirit is contained: But after what manner all the venal blood may be transchanged by the ferment of the heart, into spirit, without a diversity of kind, as much as may be said, I have explained in the Treatise of *Long Life*: Because otherwise, Natures are not to be demonstrated from a former Cause, as neither the operations of Ferments, because they are essentiall causes for the transmutations of things.

Therefore the vital spirit is saltish, and therefore Balsamical, and a preserver from corruption, and that not so much by reason of the salt, as in respect of a light conceived in its own Salt: And so, neither can air be made the addition or nourishment thereof: For although the *Aqua vite* be easily assumed into vital spirit, yet this is not oylie and combustible, but the spirit of wine onely by the touching of a ferment, doth easily ascend wholly into a saltish volatile nature, forthwith as soon as it looseth its oylie or enflamable property.

Even as I have taught by Handicraft operation in the Treatise of *Duelch*: To wit, after what manner, at one onely instant, *Aqua vite* may be truly changed into a yellow gobbet or lump, not inflamable; which thing doth more evidently happen to *Aqua vite*, by a saltish vital Ferment.

Therefore the Spirit of Wine, is straightway snatched into the heart without delay, or by a further digestion, through the Arteries of the stomach, and restoreth the strength, because it is by small labour perfected in the heart: yet we must not think that the vital Spirit is soure, because the Spirit of Salt-peter is pleasingly sharp, and is made at length of the Spirit of Urine: Because the Spirit from whence Salt-peter is coagulated in the Earth, was not soure or sharp while it was the Spirit of Urine: Therefore the vitall Spirit is Salt, not soure (for that which is sharp out of the stomach, is an enemy to the whole Body) being nearer to the Spirit of Urine than to Salt-peter, and it is as yet much more divers from the Spirit of Salt-peter, by the adustion, and co-mingling of the adjunct with the thing extracted: But they do easily perceive the saltness of the vital Spirit, who have had some stupid member, which by degrees receiving touching, doth suffer, pricking and stings, which are the true tokens of saltness. Indeed the saltness of the Spirit may be known, but the light of the same proceeding immediately and fountainously from the Father of Lights, doth drive away all further search of mortall men.

Furthermore, that the whole venal blood is a meer Salt, it desires not more strongly to be proved, than because the whole venal blood is in Ulcers, the drop sic Ascites, &c. homogeneally made a Liquor, by an immediate degeneration: For the venal blood is intently red, but it growes yellow while it is made arterial blood; because redness waxeth yellow when it is as it were dissolved by a volatile Salt. It is as yet a dead thing, whatsoever I have spoken of hitherto.

- 21 The vital Spirit performs the offices of life : But the famous top of life is not proper to a Liquor, or exhalation, as they are Salt things : And that the life of things may live, it ought of necessity, to have a Light from the Father of Lights : Therefore it behoveth, that the Spirit, or vital Skie or Air, be enlightened with a Light simply vital, not indeed universal, but specificall and individuating : Nor also with a fiery, burning, enflaming light, and conspicuous by concentrated beames ; But it is a formal light of the condition of a sensitive Soul. In which word, the descriptions, and further diligent searches of mortal men are stayed : to which end, imagine thou, that *Glow-worms* have a light in their belly a little before night, (as also bubbles of the Sea have a night brightness, and very many things, which through putrifying, do proceed into the last matter of Salts) yet vital ; and that which is extinguished together with their life. Suppose thou a certain like light to be in the spirit of life, which as long as it liveth, shineth, and when it forsaketh the eyes of one dying, they appear horny, and made clean.
- 22 And that light is now and then extinguished, the material vital Spirit being as yet safe, in the Plague, poyson, founding, &c. yet thou mayst not think, that the like essence of light is in us, and *Glow-worms*, that indeed lights do differ onely in the tone or tenor of degrees :
- 23 But in very deed, there are as many particular kindes of vital lights, as there are of Creatures that have life. And that is an abundant token of divine bouny, that there are as many particular kindes of Lights, which are comprehended in us under one onely notion and word, and that there are as many vital differences as there are Species of vital things : because that those lights are the very lives, Souls and Forms of vital things themselves (yet I except the immortal minde, while I treat of frail lights, although it self also be a certain incomprehensible light) and so by the same Lights themselves, is the alone and every distinction of particular kindes : Therefore the Father of Lights delighteth in the unutterable abundance of generall kindes of Lights, with a far greater bounty, than in fashioning almost infinite varieties in one onely humane countenance : For there is with himself, a certain Common-wealth of Lights, and a Legion of unmemorable Citizens, a certain likeness whereof he expresseth by the Forms of vital things, in the sublunary World.
- 24 Therefore the vitall Spirit is *arterial blood resolved by the Ferment of the heart, into a salt Air, and enlightened by life* : which light is in us hot, of the nature of the Sun, and is cold in a Fish, neither doth it ever aspire unto any power of heat, wherefore our heat is not a consumer of the Original moisture (even as concerning long life) seeing fishes have not hitherto escaped death.
- 25 Neither could the first men who before the flood, saw a thousand Solar years, have had more radical moisture by ten fold, than us, unless they had had all things ten fold more extended ; which is an impertinent thing : For truly, it is probable, that *Adam* being formed by the hand of God, obtained the most exceeding perfect Stature of the Lord *Jesus Christ*, neither to have exceeded the same. Lastly, Fishes should naturally be immortall, under the frozen Sea, seeing their radical moisture should not there evaporate by heat. Some of our Religious Country-men are almost for a whole year so cold from the Foot even to the Belly, that they do not feel that they have feet : wherefore they should likewise be longer lived than us, yea and their Legs should be like young mens, when as their whole Breast is crisped with old wrinkles, if primogeneal moisture being consumed by heat, should afford an unavoidable necessity of death. And likewise, as well Fishes as those Religious men, ought to refuse the daily refreshments of nourishment, because scarce any thing doth expire thorow the pores : or if heat should be of the essence of our life, certainly the part languishing with continual cold, should either die, or at least should be changed into a Fish.
- 26 Whence it is plain, that heat is onely an adjacent to our life, and its concomitant token, but not the primary foundation thereof.
- 27 Therefore the Schools may see, how unfitly they have hitherto circumscribed the whole constitutive temperature of nature in heat : For far be it hereafter so blockishly to philosophize, and not to know, that the consuming of moisture by heat, which is terminated with in-thickning, is one thing ; and that which is wholly moved forward to transpiration by an extenuating Ferment, is by far another : For this leaveth no residence behinde it, but that a Sandy Stone, or Coal.
- 28 But if an increased heat doth sometimes rise up in us, so that it is that which doth as it were burn the members, gangrene them, and like fire make an Eschar, or now and then doth eat into the flesh like a Dormouse, those indeed are the works of corrosive, degenerating, lawless Salts, that are banished from the vital Common-wealth : So also by laxative poysons, and Fluxes, the whole venal blood is resolved into putrefaction, and the venal blood being resolved by other poysons into a liquor *Sunovic* or Cleary water, poyson, jaundousexcrement, &c. doth

doth flow forth, oft-times most sharp, and oft-times raging without a Corrosive: For such kind of errors do happen in the life (for therefore in a dead carcase they do cease) as they by a proper Blas, do put on the animosity of nature corrupted by the Life, and the life doth enflame a sword, whereby it doth manifoldly hurt it selfe, even as sometimes concerning diseases.

At length, whether there be any Animal spirit to be distinguished in the Species from the Viral, or whether the disputation thereof be a true brawling about a name. I have shewd what a thing is in it self, whereunto a name adds nothing, or can take away nothing. The viral spirit doth climb through the chief Arteries into the head: But in the heart or middle of the Brain, there is one onely bosom, which being beheld above, seemeth double; but its Vault being lifted upwards, it sheweth a onenesse. Moreover in this bosom the Arteries do end into a certain wrinkled vessel, plainly of another weaving or texture, than is the other compaction of Arteries. Hereby indeed, the vital spirit flowes abroad, and expireth into the bosom of the Brain, for the service of the chief faculties, to wit, of the imagination, judgement, and memory. Hereby also it proceeds to be distributed into the small mouths of the Sinews, beginning from the Brain: So that, if it be to be called Animal, as receiving or under-going in the Brain, a limitation of the part, it doth obtain the properties fit for an appointed function, yet it doth not therefore seem diverse from the vital, by its matter, and efficient cause.

For truly, in the largeness of its own vital light, it is capable of all those Properties without the thorow changing of its native essence: For that Spirit which is thrust forth unto the tongue, doth exercise the tasting, but that same doth not tast in the fingers, but doth every where receive a particular Character of Organs or Instruments, and puts on a particular property: The which if thy mind carry thee to distinguish from the vital spirit, there shall again be as many essential divisions of the spirit, as there are offices, and as many as there are services divided by the pluralities of offices.

In the mean time, understand the thing, and call it as thou listest: For I am not contradictory to the Schools out of a stomackful passion: for I being admonished by a superiour Authority, ought only to have laid open their errors, and to teach things unknown. Let they themselves likewise disclose my errors or mistakes with an equal mind, surely I shall rejoyce, if so be that onely my neighbour do obtain the profit, which I wish.

CHAP.

CHAP. XXVII.

Heat doth not digest efficiently, but only excitatively or by way of stirring up.

1. Heat is not the proper instrument of digestion. 2. What hath deceived the Schools herein : 3. The defences of the Schools. 4. The rashness of Paracelsus. 5. The anguishes of the Schools. 6. They forgot their own Maxim concerning contraries. 7. They have constrainedly made heat, and the predicament of heat, more powerful than fire. 8. Digestion, and Seething do differ. 9. Ferments are angry because they are put after. 10. What the univocal action of heat is. 11. A fish digesteth without heat. 12. There is no place for potential heat in things to be digested. 13. An Argument of hunger. 14. Another from the unity of specificall heat. 15. The third from a Maxim. 16. Another Argument. 17. Why sowre belching after the savour of burntish ones is good. 18. Why one sick of a Fever abhorreth fleshes. 19. From the scope of healing. 20. The admiring of Paracelsus. 21. An error of the same man. 22. The digestive force of Hens. 23. The Authour being as yet a Boy, learned the true cause of digestion. 24. He knew resolving to be from sowrnesse. 25. We grow old only through extreame want of Ferments. 26. The quality of a fermenting sowrnesse. 27. Whence is the dislike of some meats. 28. The forces of ferments. 29. Mice accuse the Schools of error. 30. Why the Ferment of the stomach is divers from it self. 31. A commendation of the Spleen. 32. Degrees of heat and cold do vary. 33. The errors of the Schools concerning the degrees of Elements. 34. The degrees of Chymicall heat. 35. The Authour hath made degrees of distinction. 36. Moisture, and drynesse are not to be considered as qualities. 37. Why they do not admit of degrees. 38. Hence trifles were introduced by the Antients into the doctrine of the Elements.

BEcause the whole foundation of nature is thought to hang on the hinge of heat, and the Elements, mixtures, and temperaments are already banished far off; therefore to establish the progeny of the *Archeus*, and vital Spirits, we must hence following speak of digestions: The which, because the Schools have enslaved to heat, I will shew that heat is not the proper instrument of digestions. Indeed, the metaphor of digestion hath deceived the Schools: to wit, it being by a Poetical liberty borrowed from a rustical sense, introduced, they have made concoction of the same name with digestion.

And as they knew seething or boyling to be concoction, therefore they translated digestions to boyling, and on both sides where they thought heat to be the natural, total, and one only cause of them : For they saw that by seething, and roasting, very many things waxed tender, and were altered : Therefore a liberty being taken from artificial things, they translated a Kitchin into the amazed transmutations of the bowels and meats: not indeed by way of similitude, but altogether properly and immediately, and by thinking, the matter passed over into a belief, and then into a true opinion; and all the offices, and benefits of our nature, they translated into heats, and temperaments, as it were into totall causes : Especially indeed, because they perceived the bellies of men, and four-footed beasts to be actually hot ; even to that afterwards they laboured more for increasing of heat, than for strengthening of digestion : For neither have they diligently searched further into it, although the event did for the most part deceive their hope : Thinking it sufficient that heat might be found as well in boyling,

as in the natural digestion of the belly, from which, they slumbered as expecting abundant help to themselves. In the mean time they were in doubt, when they took notice that meats were not by seethings, wholly transchanged into juice by a total metamorphizing: For flesh (the vessel being shut) they resolved into a consummated Broth, a true pottage being pressed out and melted: but indeed they observed their error, because fleshy, tough, and hard remaining threads did abide, and never melt by a true transmutation into juice, yet through an aptness of belief, and antiquity of error, they suffered their eyes to be veiled, seeking privy shifts, and hiding places, they presently thought themselves safe, while that they had implored the divers degrees of heat, if not also its particular kinds and general kinds (as is a fiery, elementary, radical, correspondent to the element of the stars, &c.) yea, and the moments of heats for a help of their excuses; So that every degree should almost in every moment, have its own constitutive temperature in digesting.

In which stupidity *Paracelsus* also involved himself, who will have one only bread in so many particular kinds of living creatures, to receive a specific diversity of venal blood, and dungs, by reason of the moment of degree alone, in heat: As if the Latitude of heat could frame a species, or vary in the substance.

But while the Schools did presume to have taken away every knot in the Bulrush, they afterwards fell into the spongy differences of digestive heat, natural, and likewise into, that of besides, and against nature: And at length, they ought now and then against their will to fly back unto the sacred Anchor of hidden secrets or properties in digestions; So indeed, that there should be some certain heat the Authour of digestion, as well in diseases as in health.

Having forgotten in the mean time, that as they had feigned one only kind of contraries, and both to be said or declared after like manners, that there should be one only, and a uniform condition of both: Wherefore they forgot to devise the like particular, kinds and properties of colds: to wit, of what sort that natural digestive cold, besides, and against nature, should be. And likewise they ought to have taught some radical and primogenial cold: So that if radical heat doth answer in proportion to the Element of the Stars, and doth differ in the whole general kind, from any other luke-warmth, also radical cold ought to differ in as many numbers, and faculties, from any other cold, unlesse through the great want of truth they forsake their own wisdom as barren. So indeed, although heat not natural should proceed into natural, and this into it by an unheard of license of seeds; yet they have banished native, and feverish heat into distinct species (yea also into generall kinds) that they might save the effects attributed to digestive heat.

So that while they would believe that some Birds do digest those things which otherwise do defend them against the fury of the fire; they have acknowledged some fire to be more powerful than fire: For a Dog doth digest swallowed bones, which fire never dares to convert into Chyle: Therefore, The diversities of which effects, have constrained the Schools to erect heat into the Latitude of a predicament; opposite colds being in the mean time neglected: When as in the mean time, there is only a specific diversity of heat, which is not able to withdraw it from the number of other things.

For truly, whatsoever is cast into the stomach, digestion being at length finished, is transchanged, and far separated from boiling and other coctures, after whatsoever degree prepared.

Because the one only ignorance of ferments hath caused digestions, and the remedies of unconcoction to be unknown, and a faulty argument to be promoted, of not the cause, as of the cause: where it is not an idle brawling, as it were about a name, while fermentall effects are ascribed to heat; Because the resolving of this question doth change the intentions of healing. Therefore I willingly accustom me to enquire into the proper causes, to wit, at the meditation whereof, profit follows, diseases tremble, or the strength or faculties are made vigorous. Therefore ferments are worthily wrath, because they are against their will believed to war under a *Relolleum* or quality not having a seminal Being: For it never belonged to heat to withdraw a thing into a formal transmutation; Seeing heat by it self and primarily doth nothing but make hot, but by accident it separates watery things from stiff or tough things.

Which univocal or single action of heat, is no wise a digestion, being wholly included in transchanging: For although digestion doth happen in us, heat accompanying it, yet that is not heat, although it be by accident connexed with heat.

For therefore in a Fish, there is no actual heat, neither therefore notwithstanding, doth he digest more unprosperously than hot Animals: Neither is he after the manner of men, badly affected by things cast into him.

Therefore it is a frivolous thing to flee to potential heat for a fish: For in sensible things known by sense, the touching only is witness and judge; but not to flee to dreams: For if digestion

digestion be to be attributed to heat not actually hot, but to a virtual power; I now enjoy my wish: For otherwise, what is that I pray, but ignorantly to brawl about heat as such? And in the mean time to confesse, that there is something besides a sensible heat, which is the containing cause of digestion: For what can more foolishly be spoken, than that potential heat doth actually make hot, and that digestion is made for this heatings sake? Can a thing in power, now act actually? But at least in a Dog-like hunger, there is a most swift digestion, and implacable hunger.

13 Therefore a troublesome and offensive heat even then ought to be felt in us hot creatures, if digestion be made in us by actual heat. For if a little heat causeth a small digestion, and a mean heat, a mean one, Verily, at a powerful and troublesome digestion, a great heat ought also to be present: Which thing notwithstanding, although I have divers times the more curiously searched into, I have not found to be true.

14 Then at length it is to be noted, That the digestion of bread in a Man, Dog, Horse, Fish, Bird, differ in the whole general kind, no otherwise than as a manifold venal blood, and filths spring from thence: Wherefore from one only particular kind of digesting heat, those kinds of varieties of digestions cannot proceed: Therefore let the Schools erect, and defend so many general kinds of heats, and colds, before they do require for themselves to be believed: I therefore do draw so great a difference of venal blood from formal properties, and specifical ferments, never from heat.

15 For truly, I perfectly know, that whatsoever things have divers essentiall efficientes, have also divers effects and attribures: to wit, So that products divers in the general kind, do necessarily require their own efficient causes diverse in the general kind: For otherwise any thing should produce any thing indifferently: to wit, even as one and the same thing doth arise from the same high causes. For how frivolous a thing is it to have adjudged the vital powers, and the formal and specifical parents of transmutations, unto luke-warmths.

16 For if the digestion of heat were needful, a more prosperous and plentiful digestion should continually follow a greater heat: For by how much every cause is more powerful in nature, by so much it doth also more powerfully perfect its own proper effect: By consequence the stomach of one sick of a Fever, in a burning Fever, should more powerfully digest, than that of a healthy person; But surely in the stomach of him that hath a Fever nothing is rightly digested.

17 For Eggs, Fishes, Fleshes, and Broths, are presently made cadaverous or stinking within, and therefore they do cause adust or burnt belchings, the which, if fowre belchings do soon follow after, *Hippocrates* hath reckoned to be good, as well from the sign, as from the cause: Yet there is in one that hath a Fever a heat, also sometimes that heat is temperate, to wit, while it is not troublesome, neither doth stir up thirst, yet the digestion is void.

18 Impure bodies, by how much the more powerfully thou nourishest them, by so much the more thou hurtest them: which in a Feverish man is manifest, wherein we must presently use a most slender food, & easie of digestion: And we must abstain from the more strongmeats, to wit, those consummated or accomplished in growth, & from meat Broths, because the ferment being absent, they do easily putrifie, contract an adust savour, and turn as it were into a dead Carcass: No otherwise than as raw flesh being bound on the Wrist, Breast, Soles of the feet, or Neck; so far is it that it should be resolved into Chyle, that straight-way after some hours, it putrifies and stinks, although it be salt. The same thing is in an impure Feverish body where heat is present, but a digesting ferment is wanting: For if heat be the cause of digestion, otherwise, digestion is wanting in a Fever, but heat is present; but we must more apply our selves to digestion than to cooling refreshment, especially if no very troublesome heat be present.

19 Therefore we should rather study the increase of heat, than cooling: And so the Scope of the Physician should be changed, while it should be devised concerning the increase of heat in a Fever, for digestion, nourishing, and increase of strength. Neither also shall sharp and hungry Medicines of *Sulphur*, *Vitriol*, *Salt*, *Niter*, *Citron*, and the like, help; but the heat should be stirred up, and increased by sharp things. He speaketh something like madness, who saith, *That the Snow makes cold, as it is white*: So it is a ridiculous thing to affirm, *That the specifical ferment of the stomach doth digest by reason of vitall heat existing in it*. Surely it is to be lamented, that the credulity and sloath of those to whom the care of the life is committed, have changed burying-places into a meer Sumen or fating juice, despairing of the searching out of natural properties, whence notwithstanding, they have their Sur-name.

20 *Paracelsus* also being deluded by a digestive heat, and ignorant of the Ferment of the stomach, admires that some things which are most hard, are changed into Chyle in a few hours

hours, and that a bone is consumed in the luke-warmth of the stomach of a Dog: who aspiring to the Monarchy of healing, failed thereof; after that he named this a power to be admired at, was ignorant of and knew not the ferments.

For being unconstant to himself, he wrote elsewhere, *That this digestive property doth agree no lesse to the mouth being shut, than to the stomach;* and so also from hence, *That Anchorets have spent their long life happily without swallowed meat.* But surely, that Idiotisme is to be left to his own boldness; while in the mean time, whatsoever hath perhaps remained within the hollownes of the Teeth, is straight-way made like a dead carcase, with a horrible stink, but is not digested.

For I remember that a white and thick glasse being cast out of my Furnace, was swallowed by my Hens, they being deluded through the heat of Milk, but the fracture of glasse is always sharp-pointed; but after a few dayes some Hens being killed, the glasse was found to be pointingly diminished on every side, and to have lost its sharp tops, and to have been made roundish or globish. But the other surviving Hens and Guests, had presently after a few dayes, consumed the rest of the Glasse, although they had also devoured the small Pellets of Glasse taken out of the Hens formerly slain. Thou shalt take notice in the mean time, that glasse doth resist waters which resolve any Mettals. Indeed the ferment in many Birds is so powerful, that unlesse they are now and then fed with Tiles or Bricks, Chalk, or white earth, they are ill at ease through the multitude of sharpness: But on the contrary, that the stomach of one that hath a Fever, is wholly of an adust favour, he rejecteth meats of three dayes continuance, being oft-times as yet distinguished by the sight, or sometimes turned into a yellow, or rusty liquour, to wit, through the straining scope of the ferment.

I learned the necessity of this ferment of the stomach, while being a Boy, I nourished Sparrows; I oft-times thrust out my tongue, which the Sparrow laid hold of by biting, and endeavoured to swallow to himself, and then I perceived a great sharpness to be in the throat of the Sparrow, whence from that time I knew why they are so devouring and digesting.

And then I saw that the sharp distilled Liquor of *Sulphur* had seasoned my Glove, and that it did presently resolve it into a juice, in the part which it had moistned; which thing confirmed to me a young Beginner, that meats are transchanged by a sharp or soure thing, and so that a ferment doth inhabit in the stomach, which should change all things cast into it, although sweet, presently into a sowreness: Wherefore also all things are sharp which are given to drink to him that wants an appetite, as are Oyl of un-ripe *Olives*, *Vinegar*, juice of *Citron*, of *Orange*, *Mustard*, also *Salt*, and *Salt-peter*, as it hath a spirit in it that causeth hunger, and most pleasingly sharp: And likewise, the *Berberie*, *Rasp*, *Cherries*, *Quinces*, &c. In this respect they give content to silk folks that want digestion or concoction. Therefore the contemplation of this ferment is so necessary, that it is chief in the Government of life, and therefore it is to be grieved at, that the knowledge thereof is hitherto suppressed in the Schools.

And although the dryth of the whole body waxeth strong with old age; yet we do not wax old, unlesse by the penury, poverty, and extinguishing of some ferments: For truly, the *Stag*, *Crow* or *Raven*, *Eagle*, *Goose*, &c. in their first yeers of youth, are far more dry than we, yet they remain alive for some ages, yea Youth is voluntarily renewed to the *Eagle*; and *Stag*.

But that digestive ferment is not placed in any kind of sharpness only: For neither doth *Vinegar*, or the Broth of *Citron* leaven or ferment the meal; yea, neither is leavened meal therefore the ferment of the stomach; but this is a sharp, hungry, stomatical, specifical, and humane ferment: Indeed so specifically distinct throughout all the species of Bruits, that it is appropriated to themselves: For *Mice*, *Dormice*, and *Swine* do sooner perish with hunger, than they do eat of a *Ring-Dove* or *Wood-Culver*: But in a manner for the most part aspieth to the largeness of a general kind.

In the mean time, many do abhor Cheefe, Wine, Milk, or do despise other things, because they do not digest them; And therefore what things soever do strive with our digestion, are specifically contrary to the property of that Ferment, and do endeavour to oppress the Ferment. Therefore the Digestive Ferment is an essential property, consisting in a certain vital sharpness or sowreness, mighty for transmutations; and therefore of a specifical property: For the *Falcon* dyeth before he will eat up Bread. I have already said elsewhere, that if the venal blood be filled, by whatsoever degree of heat, yet it is alwayes thickned, waxeth dry, and leaves a Coal behind it; yet that and the same venal blood doth wholly exhale by our Ferments, with an unsensible transpiration. Seeing therefore heat doth alwayes univocally or singly operate it, cannot by digesting change the meat into Chyle, into blood, into a nourishable liquor, and at length banish it by an unsensible efflux, without any remainder of it self: One only heat cannot I say, in a Youth, change venal blood into bones, and likewise in

the breaking of a bone, constrain the venal blood into a callous matter, which in those of ripe yeers, and likewise in healthy people, doth wholly fly away into exhalations, unless besides heat there are other powers, knowledges and perceivances, the chief effectresses of these things : For truly it is proper and natural to heat to consume moisture, and to retain the thicker part by drying up.

29 For *Mice* are fed only with meal, without drink, and do resolve it into their own Juice or Chyle ; which thing, surely, is far diverse from the scope of heat : Therefore heat is not the Authour of digestion, but there is a certain other vitall faculty which doth truly, and formally transchange nourishments : And that I have designed by the name of Ferments.

30 But there are many Ferments in us, even as I shall by and by explain concerning digestions. But seeing the Stomack doth now and then want a Ferment, it is manifest from thence, that its own Ferment is not proper to it selfe ; but that it flowes thither from elsewhere, and is inspired : And therefore the Spleen doth so rest upon the stomach, that Hens have their spleen most unitedly heaped about their stomach, and therefore do they also the more strongly digest.

31 I do here lay open the blindness of the Schools, exceedingly to be admired, and bewayled with tears of blood ; who have dedicated that Noble bowel of the Spleen for the sink of the worst melancholious excrement, by the assistance of which one Bowel we live, and do possess life, and the golden Kingdoms of Saturn : But they have devised, that the sharp and black excrement, which being now and then seasoned with too much Ferment, is rejected by the Spleen by reason of the indisposition of the Bowel, is therefore black Choler : which things shall hereafter in our *Duumvirate*, and likewise concerning Digestions, be made more cleer.

32 Moreover, before the conclusion of this question, we must note that among Physitians there are only four degrees of heat, and as many of cold, in Simples : to wit, from the temperate degree even unto *Cautsticks* and *Escharrers* ; because they treat only of a virtual and potential quality, the which I shall sharply touch, in its place elsewhere : For therefore the fourth degree of heat is with Physitians, in the nature of things, and temperate as to the touching.

33 But the Phylosophers do measure heat according to the fire, and so even to the fire, they feign eight degrees, whereof the fifth, sixth, and seventh, they have not yet designed, because men are wont to believe their positions. They will have the eighth to be only in the Elements, and into this they have believed the passage of the Elements to be ; for they supposed to have proved something in the fire (as if Kitchen-fire were an Element) and never elsewhere. But I have already before demonstrated this whole opinion to be of no value. First of all, it is ridiculous, that they have made the degree of heat in the fire equal to the cold of the water, to the moisture of the air, and to the dryth of the earth : Wherein they being notably deluded, neither therefore have they bravely shewn the same degrees to be so violent elsewhere, as in fire. Indeed in this eighth degree they affirm, *That the Elements do destroy, devour, and consume each other, no otherwise than as fire doth consume wood.*

34 And then, the *Chymists* after the custome of Physitians, have made only four degrees in the fire it self, taking little care to themselves touching the other Elementary qualities, because they had enslaved themselves only to the Art of the fire ; which degrees indeed they distinguished, so that the first is from a luke-warmth under a wandring Latitude, even unto the fire of sublunation or cleering up of Oylie spirits : But the other from hence, even to the sublunation of dry spirits : And then a third is, even unto an obscure fieryness : But the last is, even unto the utmost power of the flame of a *Reverbery* or striking back.

35 But I for a more cleer doctrine, do in Chymicals, distinguish the degrees, that the first may be where the greatest cold is more remis or slack : For I who conceive Chymistry to be the Chamber-maid, and emulating Ape, and now and then the Mistress of nature, do subject the whole of nature unto Chymical speculation. Therefore the second degree in nature, may be heat as is that of water not yet frozen. The third is, where it is remisly cold, even as Well water : Otherwise, absolute heat is deceived at our touching (which is luke-warm) and it is thought to be cold, whatsoever doth heat lesse than it self : And seeing the touching is more or lesse hot, it makes an unconstant token or signification of heat. At length, a fourth degree is that of a gentle luke-warmth. The fifth is now luke-warm. The sixth is ours. The seventh is now Feverish. The eighth is of a *May* Sun. The ninth is distillatory, and that which now overcomes the touching. A tenth distilleth with boyling up. The eleventh sublimes *Sulphur*, and dry spirits. A twelfth doth melt, and sublime the fire-stone. The thirteenth is in a somewhat brown fieryness. The fourteenth is a bright burning fieryness. The fifteenth, Lastly, is the ultimate vigour of the Bellows and *Reverbery*.

Lastly,

Lastly, Although heat, and cold are real qualities, and do undergo degrees; yet moisture and driness are not to be considered but in their own Concrete or composed body, and therefore neither do they constitute qualitative degrees, but only quantitative ones: Because moisture in one only drop is as deeply moist in dry white earth, as in its own Element; because moist and dry do co-mingle themselves in their root, neither do they mutually enter, and pierce each other; And therefore neither do they mutually dispose of, and affect each other formally: For those kind of appropriations, do agree to seeds, but not to Elements.

Therefore moisture, and driness do not admit of degrees, neither therefore do they change, as neither do they alter each other: Because properly, they are not qualities in the abstract, but qualified bodies themselves. But heat and cold do mutually pierce each other throughout their least parts, and do break, and graduate each other: And therefore it is no wonder that the Schools have remained so dumb in the degrees of moisture, and driness.

For to the air, that there is a moisture heightened unto eight degrees, but to the water, that the same is remiss or temperate, to wit, to the fourth degree: Lastly, That driness is heightened in the earth to eight, but remiss in the fire unto four degrees. But these trifles of Complexions, as well in Elements as in Bodies which they have hitherto believed to be mixt of the Elements, have fell to dung, being on every side already fore shaken by a manifold necessity of going to ruine.

CHAP. XXVIII.

The threefold Digestion of the Schools.

1. *The generall scope of this Book.*
2. *The first digestion, in the stomach.*
3. *The first Region of the Body.*
4. *Two things are to be admired in this work.*
5. *Another digestion, and second region.*
6. *The third digestion.*
7. *The last Region of the Body.*
8. *The forgetfulness of the Schools.*
9. *The state of Growth.*

IT is not enough to have shewn that there are not four Elements in nature, as neither the material mixtures of them, and Complexions, and Strifes resulting from thence: Lastly, Not their Congresses or Combates, embraces of humors feigned from thence, and the madness of these; But that contrarieties sprung from thence, and the abounding of humors in the Body, are the meer dreams of the Gentiles, brought into Medicine, and even till now adored by the Schools: Neither is it enough that I have shewn elsewhere, that the three first things are to be banished from the rank of diseases, and cures: Likewise to have refuted the causality of the Stars in healing; also to have hissed our Winds, to have rejected the Consumptions of radical moisture, as vain terrors: Last of all, to have expelled *Catarrhs*, and the hard, and new invention of Tartarous humors; and so to have shewn that a disease as well in the general, as in the particular, hath hitherto lain hid from the Schools, and consequently that mortall men do languish under a conjectural Art, as yet fundamentally unknown, unless I shall even discover the proper causes of Diseases. And seeing the causes of the most inward enemies are for the most part intimate or most inward: I will before all things propose a history of the functions or offices; but after that done, I will demonstrate some principles of nature necessary to be known, hitherto unheard of.

The Schools affirm *That the meat and drink are by the force of heat transchanged in the stomach into a liquor*; the which, by reason of its likeness to Barley Cream, they have called *Chyle*: But they say, *That afterward, this Chyle is by the veins inserted in, and accompanying the stomach, and whole guidance of the Bowels, therefore being annexed by the mediating Mesentery (which in the room of a third Coat, doth cloath, encompass, and involve the Bowels) by little and little sucked forward, and drawn inward: But that the more grosse remaining part is left in the Bowels, as it were unprofitable dross, to be expelled thorow the Fundament.*

3 Indeed this first cōtion, they have called the first of the three digestions: And so that the first Region of the *Body* begins from the mouth; but to be terminated in one part, in the fundament; but in the other part in the hollow of the *Liver*.

4 Two things sufficiently admirable do concur herein; To wit, that in a few houres, hard meat is resolved into juyce, and that the veins are terminated into the bowels by their utmost mouths, that by these I say, they suck thorow as much Liquor every day, as is cast in, and made; But that they do not suck to them any thing of a blast more subtile than that Cream: yet the bowels are not found porous or holie in life more than in death: Nevertheless, the whole Chyle passeth thorow the veins of the Mesentery, into the *Liver*;

5 Wherein they say, the whey of the venal blood is again seperated for Urine, which passeth thorow to the Reins; but they will have the more corpulent Cream to be changed in the *Liver*, into venal blood: For in the first digestion, that which is more hard and thick, is excluded: But in the other, the thick is retained, the transparent part being secluded: Therefore the second Region and Shop of the *Body*, begins from the very *Body* of the *Liver*, and is terminated in the ultimate branches of the hollow vein.

6 And then in the third place, the blood falling down out of the veins, and being snatched into the nourishment of the solid parts, is by degrees perfected, and transchanged into a humour, which they call secondary: And that they divide into four degrees of affinity, before it being truly informed, be admitted into the solidity of the sound parts: Therefore, in this alimentary humour, is bestowed the labour of the third and highest digestion.

7 And therefore, they call this last shop of the *Body*, the habit of the *Body*, and do forget the *Bowels*: The which indeed do also themselves, by the same right, concoct for themselves, and are thereby nourished. For truly, in this humour, every part lives in its own Orbe; and every part hath a singular Cook-room in it self, for it self: But besides, even till a certain age, and measure inbred in the Seeds of things, the nourishment departs into increase: Then it stayeth, and is no more mixed with its first constituters: And therefore this nourishment is opposed onely for the retarding of the dryness of old age, even unto the closure of life. This indeed is the distribution of the digestions, and Regions of the *Body*, among the Antients, and modern Schooles: which hath never seemed to me to be sufficient; but full of ignorance: because it is that which (besides rude observations) hath brought no light unto the art of healing.

CHAP. XXVIII.

A six-fold digestion of humane nourishment.

1. The miserable boastings of the Galenists. 2. Whence the first dissolution of the meat is. 3. A sharpness being obtained, is presently changed into a salt Salt. 4. The use of the gut Duodenum neglected in the Schools. 5. Sharpness or sourness out of the stomach, doth hurt us. 6. The variety, and incompatibility or mutual unsufferableness of the Ferments. 7. An example of that ready exchanging. 8. Nothing like a Ferment doth meet us elsewhere. 9. The volatileness of sharpness doth remain in a salt product. 10. The latitude in Ferments. 11. Whence it is known that the first Ferment is a forreigner to the Stomach. 12. why Sawces do stand in sharpness. 13. Sharpness is not the Ferment it self, but the Instrument of the same. 14. Too much sharpness of the Stomach is from its vice. 15. A receding from the Schools in the examination of the Gaul. 16. That Choler is not made of meats. 17. That the Gaul is not an excrement, but a bowel. 18. The membrane of the wombe is a bowel, even as also that of the Stomach. 19. Why the Gaul and Liver are connexed. 20. What may be the stomach of the Liver. 21. Why it goes before the Ferment of the Gaul, and is the second digestion. 22. Why the venal blond in the Mesentery doth as yet want threds, neither therefore doth it wax clotty. 23. The wombe of the Urine, and the wombe of Duelech or the Stone in man, are distinct. 24. The stomach of the Gaul, and its Region. 25. The rotten opinion of the Schools concerning the rise of the Gaul, and its use. 26. Nature had been more careful for the Gaul its enemy, than for Phlegme its friend. 27. The separation of the Urine differs from the separation of wheyness out of milk. 28. The second and third digestions are begun at once, although the third be more slowly perfected. 29. What the stomach of the Gaul is. 30. The Gaul doth import more, than to be chief over an excrement. 31. Birds want a Kidney and Urine, but not a Gaul. 32. Fishes also do prove greater necessities of a Gaul, than of filth or excrements. 33. That the Schools are deceived in the use of the Gaul. 34. The Liquor of the Gaul with its membrane, being a noble bowel, doth now and then banish its superfluity into the gut Duodenum. 35. How excrements do obtain the heat of the Gaul, yet are not therefore choler, or gaul. 36. The proper savour of the dung doth exclude the gaul, and fiction of choler. 37. Gauls seem what they are not. 38. Whence the vein hath it, that even after the death of a man, it doth preserve the venal blond from coagulating. 39. The extream rashness of the Schooles. 40. The solving of an Objection. 41. It is proved by many Arguments, that the veins of the Stomach do not attract any thing to themselves out of the Chyle. 42. The Authour is dissented from the Schools, in respect of the bounds of the first Region in the Body. 43. The true shop of the blond is not properly in the passage of the Liver. 44. The action of a Ferment doth act onely by inbreathing, neither doth it want a corporeal touching. 45. The absurd consequences upon the positions of the Schools concerning touching, and continual nourishing warmth. 46. The Ferments of the Gaul

Gaul and Liver do perform their offices by in-breathing. 47. Why Flatus's or windy blasts do not pierce an Entrail. 48. The Errour of Paracelsus about the pores of the Bladder. 49. The first digestion doth not yet formally transchange meats. 50. Where the absolute transmutation of meats is compleated. 51. It is false, that nourishment is not to be granted without an excrement. 52. It is false, that the stomach doth first boil for it self, and secondarily for the whole Body. 53. The Gaul hath the nature of a Balsam. 54. A miserable objection. 55. The Gaul taken for a Balsam in the holy Scriptures. 56. Against the Gaul of the Jaundise. 57. Two Idiotisms in Paracelsus. 58. How the Salt of the Sea is separated from Salt-peter. 59. Out of water there is Vinegar. 60. The fourth digestion and Region of the Body. 61. Why the heart is eared. 62. The fifth digestion. 63. That the vapour in the venal blood, is not yet a Skye Spirit. 64. The nourishing of the flesh, and the bowels, is distinguished. 65. That the Animal Spirit doth not differ in the Species from the vital. 66. The fourth, and fifth digestions do want excrements. 67. What the sixth digestion is. 68. The Diseases in the sixth digestion are neglected by the Schools, because not understood. 69. In the designing of the Kitchen, and Shop, there are some errors of the Schools. 70. Why an Artery doth for the most part accompany a vein. 71. Paracelsus is noted. 72. The error of Fernellius concerning Butter. 73. The rashness of Paracelsus concerning Milk. 74. A censure or judgement of Milk. 75. The best manner of drawing forth Goats blood. 76. An undoubted curing of the Pleurise without cutting of a vein. 77. why Asses milk is to be preferred before other Milks. 78. The education of a Child for a long and healthy life. 79. Some things worthy to be noted concerning the Urine. 80. Why dropical persons are more thirsty than those that have a hectick Fever. 81. The proper place of the Ferment of the Dung, is even as in a Wolf. 82. The proper nest of Worms, and the History of the same. 83. The difference of Ascarides from VVorms. 84. That a Clyster is injected in vain for nourishment sake.

I Have observed notable abuses committed throughout the whole description of Functions, or of the use of parts: Although Galen doth not more gloriously triumph in any place, than in the Treatise of Pulses, and in the use of parts; the which notwithstanding, the modern Anatomists do shew, that he never thorowly considered: wherefore it is altogether probable, that without the knowledge and searching out of the truth, these Treatises described by Galen from elsewhere, and prostituted for his own, are as yet to this day worshipped in the Schools. Wherefore I have premised the digestions which Antiquity hath hitherto known, and hath confirmed each to other by subscribing; and I will subjoyn those things which singular experience under divine grace, hath taught me.

2 Without controversie, it belongs to meats and drinks, together, and in like manner, to be dissolved into a Cream, plainly transparent in the hollow of the Stomach. I add, that that is done by vertue of the first Ferment, manifestly soure or sharp, and borrowed of the Spleen: for I have found as many suitable Ferments, as there are in us, digestions. Again, neither is it of lesse admiration, that that Cream is spoiled wholly of all drawn sournels of the ferment, as soon as it slides out of the stomach into the great Bowel or intestine, than the power of that ferment in the stomach, was wonderful. That intestine is called the *Duodenum*, from the measure of 12 fingers, and it is immediately under the *Pylorus* or lower mouth of the stomach.

3 Truly Anatomy complains of trouble in this place, by reason of the stretching out the offices of the kernels and Vessels, to wit, in so small a space, for Instruments of so great uses; and so that in the whole dissection, nothing doth offer it self alike difficult: For neither are there so many Vessels and Organs in vain, although their use hath stood neglected.

For

For first of all, when I learned that the *ferment* conceived in the Cream of the Stomach, was pernicious as well in the intestines themselves, as in other parts, by reason of many torments or wringings.

I not sloathfully noted, that all particular parts have obtained particular *ferments*, seeing there is an unexcusable necessity of these, in transchanging. And so I also from hence further concluded, that all particular *ferments* do abhorre strange ones to be their Companions, and the commands of strange patrons, as if they were forreign thieves, and such as thrust their Sickle into another mans Corn: And that indeed through no vice of jealousy, as though they did envie the activities of others: But from an endeavour of executing the office; which was enjoyned them by the Lord of things. It is a wonder to be spoken, that a sour cream in the *Duodenum*, doth straightway attain the savour of Salt, and doth so willingly exchange its own sharp Salt, into a salt Salt.

No otherwise almost, than as the Vinegar which is most sharp, hath forthwith (through red Lead) put off its former sharpness, and doth presently change into an aluminous sweetness; Even as also the sharpness of *Sulphur*, is forthwith changed in the Salt of *Tartar*; But by a far more excellent vigour of transmutation, that sour Cream is presently made Salt in us.

For truly, that is made without any co-mixture of any Body, even as when *Vinegar* waxing sweet, it is constrained by the addition of the Lead, or a sharp distillation is drunk up in an *Alkali-Salt*: Because in very deed, nothing is any where found, which can fully answer to the force of a *ferment*; seeing *Ferments* are the primitive causes of transmutations, and that indeed from a former cause: and therefore it must needs be, that the similitudes of those, drawn onely from a latter effect: do very much halt.

Therefore our sour Cream is made salt, only by a fermental, and unchangeable disposition: wherefore also, the volatile sharpness of that Cream doth remain in its antient volatility, while it exchangerh its own first obtained sourness with saltness: For the volatile stillatitious sharpness of Vinegar, doth not thus remain volatile as before, while it dissolveth *Litharge*, *Minium*, or *Ceruse*: because in dissolving, it is coagulated, and doth assume the form of a more fixed Salt, now separable from the liquid distillation of the Vinegar, which it had lately married; but in dissolving it is coagulated, and doth assume the form of a more fixed Salt: because it is the action of a thing dissolving, and dissolved, but not of a transchanging Ferment, which doth continually tend to a new Form on either side.

For indeed, the Stomachs of some do more easily digest Potherbs, Pulses, or bread-Corns; but those of others do more succesfully digest Fishes, abhorre Cheese, prefer water before Wine; whereas in the mean time, the stomach of others, is a devourer of flesh, or addicted to Apple; to wit, by reason of a specifical, yea and also an appropriated property of that Ferment: yea neither is it sufficient to have said, that the sour Ferment of the first digestion, and totall cause of the melting of the harder meats doth freely inhabit in the stomach, unless that very thing be more plainly explained.

First of all; the stomach hath not this Ferment in it self, or from its own self: For the digestion of the appetite, and Family-government of the stomach do sometimes depart, and return without extinguishing; because they are not of the stomach it self. Wherefore I have said, that the membrane of the stomach hath all the efficacy of its digestion, and government thereof, from the Spleen: For surely, the Spleen together with the stomach, doth therefore make in us one onely Duumvirate or Sherifdom, from whence indeed, the Poets have erected the Golden and prosperous Kingdoms of *Saturn*, and in pride, the liberal Feasts of *Saturn*. The Antients have smelled out some History of antient truth: To wit, that whatsoever things, meats being digested, are cast out by vomit, are of a soure taste, and smell; yea although they were seasoned with much Sugar: For soure belchings coming upon adust ones in Diseases, are reckoned to presage good, according to *Hypocrates*.

Hence indeed, all saltnesses or seasonings, and Sauces of meats for sharpening of the Appetite, are sharp; as the juyce of *Citron*, *Orange*, *Pomegranate*, the unripe *Olive*, *Tartar*, *Vinegar*, *Berberis*, *Vine-branch*, *Mustard*, and likewise Salt of the *Sea*, as it containeth a sharp Spirit in it: in which respect, also the Liquors of *Sulphur*, *Vitriol*, *Salt*, *Sal Niter*, &c. are commended: For I will not that the sharpness of any of those be consumed into increase of a specifical and appropriated ferment dwelling in the Spleen: Far be it; for *ferments* have nothing besides, or out of themselves in nature, which may worthily be assimilated to themselves; seeing they are specifical gifts of a vital nature: For therefore a *ferment*, in what respect it is a *ferment*, is a vital and free Secret, yoked to no other quality: for it is sufficient for Sawces, that sharp things do prepare meats for a more easie entrance of the *ferment* of the Spleen.

In the next place, although the *ferment* of the stomach hath a specifical tartness, yet that tartness is not the vital *ferment* it self; but onely the Instrument thereof: For the *ferment* of the stomach hath a sharpness, as a singular companion unto it self, it being also divided by properties, by general kindes, and Species: but digestion in it self, is the work of the life it self; whereof, sharpness is in this Shop, the attaching or guarding Instrument: But in the other Shops which are afterwards, the life associates to it self a secondary quality on either side, as a Minister of its intention to the fermental quality, and suited to the vital scope.

For from hence, there is no seldom offence of the stomach, it having arisen from a degree of a foreign sharpness: wherefore, an *Orexis* or inordinate appetite to meat, and such like perplexities of the stomach, do offend in an adulterous tartness: For from hence, are prickings in the stomach, difficult concoctions; lastly, very soure belchings, and vomitings: wherefore, if a *ferment* should consist in sourness; Vinegar, Oyl of Vitriol, and the like, should ferment the lump of bread, and should digest our meats by a perfect transmutation: but they do neither of these; Therefore the *ferment* is a free Secret, and vital, and therefore it every where co-fitteth to it self a retaining quality in its own Borders: Because, seeing *ferments* are of the rank of formal and feminal things, therefore they have also severed themselves plainly from the society of material qualities: But if they have associated unto them a corporeal ministering quality, whereby they may the more easily disperse their own vital strength; account that to be done for a help; and so it cannot but contain a duality with the *Ferment*: And therefore also, that quality may offend, as well in its excessive, as in its diminished degree.

For in that thing I greatly differ from the Schooles: Because first of all, they teach, that the Gaul is not a vital bowel.

2. That it is not a noble member.
3. That it is nothing, but a very unprofitable superfluity it self, and banished from the masse of venal blood, to wit, least it should infect the venal blood.
4. That it is therefore a product besides the intention of nature.
5. Being onely profitable for the expelling of Dung, and Urine.
6. And therefore that the little bag of the Gaul, is not of the substance of a Bowel, but a sack or sink of dregs and superfluities.
7. That at length, Sanguification or the making of blood doth begin, and is compleated in the Liver: which things indeed seem to me, dreams.

For first of all, seeing Choler is not required to the constitution of venal blood, that bitter Gaul or Choler should not of necessity be procreated of all kinde of meats, unless it be propagated by a proper Agent, and in a particular Shop of its own, for a profitable, vital, and necessary end: For much lesse hath the Gaul seemed to me, to be an excrement, than the water of the *Pericardium* or Case of the heart.

It is a wonder at least, why Fishes, of water, and Cattel, of Grasse, do nevertheless alwayes daily make so bitter a Liquor. Truly that simple identity or sameliness of the Gaul, through so many particular kindes, seemed to me to prove some necessity in the Workmanship of life: And so, the Gaul not to have the necessity of an excrement produced by any nourishments whatsoever, but rather the constitution of a necessary Bowel: For I ceased to admire, by considering, how great Tragedies of rule, the paunch (which is nothing but a Sack and Skin) might stir up; and that it obtained the room of a principal bowel; by considering I say, how great a prerogative the membrane of the stomach might challenge to it self; so that it hath snatched to it self, the name and properties of the heart before the other bowels: Whence surely I ceased to admire, that the name of a bowel should be given to the little bag of the Gaul, and to the Gaul it self: especially, because the wrathful power is believed by most to be bred in the same.

Surely I have found in the Family-administration of mans digestion, Bodies, and Ferments connexed of two bowels (the Gaul and the Liver) for Sanguification. To wit, the Gaul to precede in the work of Sanguification, and for this cause to be nearer to the Stomach and Entrails, than the Liver: For the Gaul is nourished in the Bosom and lap of the Liver, as it were in its Mothers Bosom; for it is the Balsam of the Liver and Blood.

For seeing Sanguification is not a transmutation, which may be introduced by a momentary disposition; and since the Liver is deprived of a remarkable hollownes, whereby it may be able to contain within it, the juyce that is to be made blood, for the leisure or terme of digestion; That is, the Liver in it self, is a solid Body, having few and slender veins, and so the whole Cream being accompanied with so great a heap of Urine, it ought to passe thorow the Liver with a swift passage; but the crude Cream, cannot by so swift a passage onely, be

be straightway changed into venal blond. Wherefore a perfect Sanguification could in no wise be made in the Liver; Because the Liver was not a Kitchen, but a family Governour by its own Sanguificative ferment, whereby as it were by a Command, it chiefly by successive dispositions, executes the office enjoyned it from its creation. Therefore the plurality of the Mesentery veins is the stomach of the Liver it self, and the preparative Shop of the venal blood: And the perfection thereof, the Liver doth breath into the venal blood, as yet naked, after that it is laid up into the hollow vein. Truly, as Sanguification is a certain more exquisite digestion, and a more manifest transmutation of a thing, than is the melting of the meat into Chyle, it could not fitly or profitably happen in any large vessel, but in many the more straight ones, which together, may equalize some notable capacity; whereby indeed that fermental *Archeus* may most strictly, narrowly, and neerly touch, and comprehend them all, and his Liver may communicate a ferment in changing, and may inspire a vital faculty. For the Spleen doth inspire its Ferment into the Stomack, a large vessel; for neither doth the Spleen touch the meats immediately: So also doth the Liver inspire the act of Sanguification by the breathing, or ferment of its own life into the veins subjected under it. And even as the meat slides from the Mouth into the Stomack, and there expecteth the end of digestion:

So from the Entrails the Cream is immediately snatched into the stomach of the Liver: But seeing that Cream is much, and for a great part of it excrementitious (for as yet it containeth the Urine in it) it ought first to be unloaded of its excrement, that it may the more conveniently be made blood: Because that Cream is as yet wholly undistinct; neither therefore doth it acknowledge an excrement: what therefore shall the Liver act by a single action of Sanguification? For shall the severing of the excrement, the degeneration of the Cream, and Sanguification of the Cream, be made and finished by one and the same work? Nay, Surely the Cream had need of a Ferment its transchanger, distinct from the Sanguificative ferment, whereby indeed that part of it that is less fit, is changed into a meer excrement; for the action of Sanguification could not make an excrement of that which is not an excrement: For both those do differ too much from each other: For the action which prepares an excrement out of the greatest part of the Cream, is not made by the coagulation of the venal blood, and separation of the more wheyie part:

Seeing the venal blood in the Meseraick Veins is not onely not coagulated, but neither indeed is it as yet coagulable, as long as it is conversant in that stomach: As is manifest in the bloody flux. Therefore there is made a separation of the wheyie excrement from the venal blood, in the Meseraick veins themselves, and indeed from a far other acting ferment, and bowel, than that which is employed about Sanguification or making of blood: For it is a certain act which condemns a part of the Cream into an excrement; But it preserveth the venal blood, and leaveth it untouched: therefore a production, and separation of the excrement goes before Sanguification.

And so the womb of the Urine beginneth before the Meseraick veins: Yet the womb of the stone is not as yet in the same place, because the ferment of the Rein or Kidney changeth the spirit of the Urine in the Liver, and round about it.

Therefore whatsoever was soure in the Cream is changed by the ferment of the Gaul, into the salt of the Urine: But the stomach of the Gaul is the *Duodenum*, and the following Reed of the neighbour Bowels, and it ends in the beginnings of the Veins of the Mesentery. But because this use of the parts and ferments is hitherto unheard of in the Schools, it is therefore to be dilated by a large discourse.

First of all, The Doctrine of the Schools standing; *That the venal blood is made in the Liver, and that together with the venal blood, the Gaul is also made*: Therefore of necessity also, the separation of the Gaul shall in motion, and nature be after Sanguification: Wherefore the Chest of the Gaul ought to be above the Liver, and not beneath it, nigh the port vein. For by way of supposition, I now grant the fictions of four humors; at least it had far more commodiously purged the matter, blood, from superfluous Choler, than the Chest of the Gaul (seeing indeed the Choler should as yet be mingled immediately with the Urine) and especially because they reach, That the Urine ought to be tinged by the Gaul, and therefore in vain. For why should the Gaul be so precisely separated from the Urine, if it ought again straight-way to be added unto it? I conjecture the Liver to be loaded for every event, with a vain and importunate baggage, by the little bag of the Gaul hanging on it; by the little bag I say, onely of cast-out dung, dedicated to the provoking of Urines. And being by so much more unhappy than the bladder, because seeing it is that which is a membrane of the first, and Spermatick constitution, yet that it ought to be nourished by the Gaul alone; Seeing it wants a vein propagated by running through its little bladder. For since we are nourished by the same things whereof we consist; where shall that little bag find a spermatical

nourishment from the Gaul? which in it self should be nothing but an excrement? But if the Gaul be said to be collected into the Chest under the Liver, for the wiping away the dregs of the paunch; at least, the Agent which procreateth in the Urine a Salt of not Salts, had more commodiously left a part of its own Urine for the washing and cleansing of the Entrails, and disturbing the superfluities of these, as it had freed the Liver of the stinking, and tedious burden and consociation of the Gaul. Nevertheless it is of Faith, that our body is so (workman-like) framed by God, that nothing therein is in vain, and nothing therein diminished: Because that, it is far more artificially and commodiously made, than our understanding can comprehend. Therefore, if the ends of the Gaul granted by the Schools, should be true, verily the Reins had far more commodiously satisfied those ends (as I have said) than that the workman of things had therefore loaded; the Liver with that unprofitable weight: But the consequence convinceth its antecedent of falsehood. Therefore the whole doctrine is false. If Birds do want Reins a Bladder and Urine, whereby they may the more sirly fly, but the Gaul should serve onely for the wiping or cleansing of the blood, at least the blood had more willingly wanted the refining of the Gaul, than the refining of the Urine; that is, if nature be able to separate drink in a Bird, without Urine, and therefore likewise to want Reins, and Bladder, would it not be much more easie for it to have severed some small quantity of the Gaul with the Urine, and superfluities of the paunch, than to have loaded a noble bowel with a Chest, and so

26 by the unprofitable baggage of an excrement, to have troubled Sanguification? even in Birds? Certainly nature at least reckoned to be more indulgent to Choler, than to Phlegme, because she hath framed for it a peculiar little Bladder or Bag: For it is a foolish or unfavoury thing, that nature had placed the Gaul in the lap of the Liver, for the dregs of the paunch, and bladder; when as otherwise she had dissembled Choler to be abundantly thorow mixed with the venal blood. Wherefore I more fully looking into the matter, have observed, that the Chest of the Gaul is as it were the Kernel of the Liver, curiously kept in its hollow part from injuries; but the Liver to be as the rhine or bark of the Gaul: And then, that the Gaul is so much the nearer tied to the *Duodenum*, because its digestion, and ferment should go before the digestion of the Liver, or Sanguification.

27 Indeed the wheyie superfluous part ought to be separated from the lively Cream, which separation therefore is not to be compared to whey and milk, which are not severed from each other, but with the corruption of the milk: For truly, in the Cream a separation of the whey happeneth, together with the rectifying and preserving of the venal blood: That is, the ferment of the Gaul is the perfective one of the Cream; the preservative one of the blood, and the corruptive one of the whey: which three things do together concur in one point, whereby the Gaul doth convert the sharp salt of the stomach (except that which is hurtful & corruptive in the stomach) into a salt Salt. Moreover, although I have said, that Sanguification is the latter in respect of the separation of the Urine, and transmutation of the sour into salt:

28 Yet both ferments, as well indeed of the Gaul as of the Liver, do begin at once, because neither of them keeps Holy-day or is idle: For as the ferment of the Liver is of a greater work and perfection; So it doth more slowly perform its charge, than the Ferment of the Gaul: For the aforesaid transmutation of the Cream ought to proceed, that the Liver being somewhat eased of an unprofitable burden, might the more commodiously employ it self in Sanguification. Therefore the second digestion or that of the Gaul, is distinct from the first and third, in the ferment, bowel, womb, taste, effect and end: All which the Schools are hitherto ignorant of, because erring in the use of the Gaul.

29 For in the first digestion, the stomach is the receptacle, but the Spleen doth inspire from it self, a sour ferment into the meats, and a sour Cream is thereby made: But in the other, the slender entrails are the stomach, but the ferment is inspired from the gaul, for the corruption and separation of the watery part, and a sharp volatile salt is changed into a Salt volatile one: But that this might be done by a speedy touch, I shall at sometime shew by some Handicraft operations: To wit, that the Oyl of *Vitriol* is by the only touching of *Mercury*, converted into a meer *Alum*, *Vinegar*, and *Salt*, &c. Also straightway after drink, there is oft-times a watery pissing made, yet Salt, and the mark of the first digestion is scarce conceived, but that a notable part of the drink slides forth under an error of the *Pylorus*, and by consequence, there was not made a separation of the Urine from the blood in the Liver: Because the venal blood is not as yet made in the Liver, if the Chyle it self be as yet made or concocted out of meats in the stomach: To wit, when drinkers do very often make water after meat: Therefore also Urine is made of watery drink, yea out of drink from whence venal blood was not made; and so the generating of Urine doth there go before Sanguification. At length, the very veins of the Mesentery, are the stomach of the third digestion, which way the Liver inspires a bloody ferment, and a very red or ruddy salt venal blood is the effect thereof.

For the wounds of the *Gaul* are presently mortal, but those of the *Liver* not so. If there-
fore the *Gaul* were likewise *Choler*, death would of necessity follow every effusion of
the *Gaul*. Nevertheless, the yellow Jaundise is not mortal, although the *Gaul* (as the same
Schooles do teach) is not onely diffused over the entrails; but throughout the whole Body,
equally, longly, largely, deeply, and throughout its least part: Therefore either a wound of
the *Gaul* doth import more than the effusion of *Choler*, or the Jaundise is not effused
Choler, or both is necessary. Wounds of the Bladder also, being inflicted above the share (as
successful *Wurtz* is witness, in my judgement the *Standard-defender* of the more modern
Chyrurgions) are cured, although the Urine, together with its *Gaul* (as they will have it)
cannot but be powred forth at that very time or moment.

Therefore the Chest of the *Gaul* hath a necessity, and Integrity, fast tied to the life by rea-
son of sudden death: Neither is it the effusion of that gawly superfluity, which doth neces-
sitate that speedy death. Again, *Birds* do live prosperously without Kidneys, or a Bladder,
yet not without a *Gaul*: wherefore there is a more conjoynd necessity of the *Gaul*, than of
Kidneys: Because that the Kidneys being rockie and putrified, the life is safe. And then,
Fishes (according to the Doctrine of the Schooles) do abound with very much phlegme, and
are destitute of actual heat: they are onely nourished with cold blood, and watery
food.

At length, their excrements easily glistering, they had no need of a spur, the *Gaul*.
Wherefore, seeing the ends, matter, and efficient cause of the *Gaul* attributed by the Schooles,
should fail in a *Fish*; surely we shall believe that the *Liver* is vainly, deceitfully, and by the
error of nature, yea and of the *Creator*, wearied, unless we had rather acknowledge perpet-
ual errors in the Schooles, and to contemplate some greater moment of a necessary bowel to
be in the *Gaul*.

From hence therefore, I determine the *Gaul* to be a vital Bowel, and its very Body to be
a bitter Liquor prepared of the best venal blood, containing the Balsam of the *Liver*, and Ar-
terial blood: But whatsoever it by chance casts back of it self, into the bowel *Duodenum*, is
the excrement of it self, and a Liquor now despised of the *Gaul*.

But that these things have themselves after this manner, I have at sometime shewen under
the impostures of *Choler*, by the example of a *Calf*, whole motherly, and sweet milk waxeth
sour, and is coagulated in the stomach, and therefore affords Runnet for Cheeses: For milk
is made a watery Cream, but little of coagulated milk: But that Cream contains Urine and
venal blood; but another coagulated Body, which of pale, begins to wax yellow, is made dung:
But that baggage straightway falling into the *Duodenum* doth proceed unto the *Ileus*, being
coagulated, and waxeth of a Citron colour, the more, by how much it hath departed farther
from the stomach; and at length it waxeth green; yet there is not bitterness in the yellow,
but a nitrous taste: But in the green, the smell of Dung doth now plainly appear: But the
wheyie Cream is presently drawn and supped up with greediness by the meseraick veins, for
the use of sanguification. Likewise Milk is stirred in Infants, whence also those that are the
more young ones do cackie all yellow, not from the plenty of *Choler*, neither by reason of the
domination of the Chest of the *Gaul*; but surely, because the ferment of their Dung is feeble.
Therefore the ferment of the *Gaul* doth not change the founness of the stomach into bitter;
but into Salt; for the reasons explained concerning the Spirit of life. Spare me ye more ten-
der eares, because I ought to treat of Dungs. I will therefore shew, that the savour of Dung
excludes the *Gaul*, that it befools the use of the *Gaul* invented by the Schooles, and convin-
ceth *Choler* of a fiction.

A Boy of four years old had fowled in Bed; but being much afraid of whipping, he ate his
own Dung, yet he could not blot the sign out of the sheets: wherefore being asked by threat-
nings, he at length tells the chance. But being asked of its savour, he said it was of a stink-
ing, and somewhat sweet one: For among other things, he had eat Pease-pottage; but he
complained, that the undigested husks or brans of the Pease were notably soure: for there
is not an equal vigilancy of the ferment of the *Gaul*, over thick, and undigested Dungs, as
there is over transparent things, and those things which are to be prepared into the dignity
of venal blood. I came by chance unlooked for, the same day, and I diligently enquired, a
price being also added, whether those things which he had eaten, were bitter. He answered
negatively, and the same as before. Likewise *Nuns* did Board noble Maids sufficiently so-
ber, at their Table: but they continually preached, that they who did eat dainty fare, should
have their parts with the rich Glutton; but that they onely should be saved, who by the eve-
ry way denial of mortification, did eat any the most vile things. Therefore a noble little
Virgin being very desirous of her Salvation, and much moved by the aforesaid perswasion,
eats her own Dung, and was weak or sick. But she was called home again by her Parents,

and at length told the chance: She was asked thereupon, of what savour it was, and she answered, it was of a stinking, and waterish sweet one. Thirdly, a *Painter of Bruxels*, being mad between whiles; about the beginning of his madness, escapes into a Wood near by, and was there found far from the sight of men, to have lived 23 dayes by his own Dung. He was straightway brought home; I went to see him, and the Lord healed him. But he was perfectly mindeful of all things past at the time of his madness. I asked him, whether he remembered of what savour his Dung was: He said, it savours as it smells: And being afterwards examined by me through the Capital tastes, he answered, it was not sour, not bitter, sharp, salt, but waterish sweet: Yea, he said, that by how much the oftner he had re-eaten it, by so much it had alway been the sweeter. But being asked, for what cause he had rather eat Dung, than return home? He said, that he throughout his whole madness, abhorred men, being perswaded by his own fury, that men sought to destroy him by a snare. Therefore it is manifest, that there is not even the least drop of *Gaul* in the Dung: for the *Gaul* being once burst, however a Fish may afterwards be most exactly washed, yet the bitterness of the *Gaul* conceived by the least touching, is never laid aside.

37 For if yellowness should bewray the *Gaul*, the dung of Infants should be especially gawly, which notwithstanding is licked by Dogs, because it hath as yet retained some kinde of savour of the milk: But whatsoever hath not been fully subdued in the stomach, nor hath assumed the beauty of a transparency, may not hope to be digested in the bowels by the ferment of the *Gaul*, although it be tinged with a yellow colour; Because it goes not to the second, or third, but thorow the absolute first. Whatsoever therefore is thick, and tinged with heat in the *Ileos*, that is wholly banished into an excrement, and under a certain sweetness, doth attain the savour of putrefaction; No otherwise than as soure fruits wax sweet by a little heat: But whatsoever was before sour in the stomach, that is made salt in the *Duodenum*, and is severed from the Dung: but if any thing do persevere sour, which may resist the ferment of the *Gaul*, wringings of the bowels, &c. do presently follow: But the excrement of man doth putrifie, because the ferment of the dung is chief over that place: But that which slides out of the stomach undigested, also is not digested in the bowels; It is cast out whole, but it keeps, and now and then increaseth the part of founnesses which it assumed in the stomach: For from hence do the brans in bread, provoke the stool, by reason of sharpness; but other things do wax more sharp, and stir up wringings of the guts: Therefore from the *Duodenum*, the Chyle doth forthwith begin to exchange its own sharp volatile Salt into an equall saltness, it being resolved in the Cream: But the remaining, and more corporal substance of the Cream doth expect a sanguification in the veins of the mesentery, from the inspired ferment of the Liver: The salt Liquor in the mean time being attracted by the Reins thorow the Liver, is itself committed to the Reins and Bladder for expulsion. Therefore the third digestion begins in the veins of the mesentery, which is terminated in the Liver: For the venal blood as long as it is in the mesentery, is not yet digested, nor yet thredded, or perfect: For the venal blood of the mesentery, doth therefore not grow together in the Bloody flux: But otherwise, a vein of the stomach being burst, the venal blood doth forthwith wax clotty in the stomach.

38 For the ferment of the Liver is so much inclined to sanguification (for it is its univocal and one onely office) that the veins do even by the right of league retain or hold that from the Liver, and its proper implanted *Archeus* thereupon confirming it; So that the blood in the veins of a dead Carcase is not coagulated a long while after death, which being elsewhere powred forth, doth presently wax clotty: For the Cream running down afterwards thorow the Bowels, becomes the dryer, and also the liquid matter thereof being sucked upwards into the veins: But thereby, the rest doth more and more putrifie, so that, when it is almost brought down to the ends of the *Ileos*, now not a little of a more liquid Dung is generated, because before it hath fully putrified, it is snatched to the mesentery, that it may be thorowly mingled with the Urine, profitable for its ends: Even as elsewhere concerning Fevers, and likewise concerning the Stone.

39 Which yellow Dung, the Schooles have believed to be *Choler* and *Gaul*; and so out of the Dung, they have founded their demonstration for one of the four humours, and a Gate hath thereby layen open to miserable errors, and wicked slaughters: For it was of little regard for them hitherto, to have built up their false significative knowledge by the unknown substance of the tincture of the Urine; but to have made *Choler* and *Gaul* the constitutive humours of us, the causers of all Diseases; to wit, to have feigned yellow *Choler*, and that a little the more digested, to be adust, and like the cankering of Brasse, and from thence, to be dry, and scorched melancholy or black *Choler*; but the *Gaul* it self to be the sink of superfluous *Choler*; but the venal blood to be nothing but an artificial Body, connexed of many

many things or humours, which being again seperated, they should be the same after their death, as before in their life; but that a Body is not born of Mother nature, by a true transmutation of the Chyle into univocal or simple venal blood; and at length, to have instituted healings about the removing of accomplished causes, which never will be, or were in nature. Surely that thing doth exceed gross ignorance, and renders the Snotters of the Schooles unexcusable.

But perhaps they will object to me; Thou sayest that the veins do suck the Cream, being 40
slieden out of the stomach, into the intestines: therefore the same office belongs to the veins of the stomach, that they may draw that four Cream into themselves, without the interceding of the Ferment of the *Gaul*; that is, without changing of the Sour into Salt: And by consequence, thy ferment of the *Gaul* is a dreamed and invented thing: yea meat breath injected by a Clyster, shall be able to pierce to the Liver, without the knowledge of the *Gaul* (touching the right of a Clyster, I have finished this question in the Book of Fevers.) I answer, 41
that it is an ancient abuse of the Schooles, who have equally attributed the same use to all the veins: As if the veins seperated in the arms, should busie themselves in drawing of the Cream? First of all, I have already shewen, that the blood in the veins is coagulable, the blood of the Mesentery not so. And then, we must know that all four Cream is an enemy to the veins, but that these do draw no hostile thing unto them: from whence it followes, that the veins of the stomach do not allure any thing of the Cream under them; and that all blood, before it be attracted by the veins of the Mesentery, hath boren the hand of the ferment of the *Gaul*, in its own stomach of the bowels: yea, although the Arteries being dispersed throughout the stomach, do suck the Spirit of Wine, yet they draw no juyce: For which way should the Arteries draw juyce, seeing they can never do any good thereby? seeing sanguification doth not belong to the heart, but to the Liver? Seeing the juyce being attracted in the Artery, should of necessity be a hinderance, and ought to be corrupted? If therefore the Arteries have a natural endowment of avoyding things hurtful, and likewise of drawing vital things unto them, and things appointed for them by the Lord of things; shall that discretion be denied to the veins in the stomach? For nature should have dealt ill with Horses, who being content with one onely draught in the morning, are fed all the day after, with Straw, Hay, Chaffe, Oats, or Barley: For truly dry or unjuice things, should straightway contract thirst in the stomach; if the veins of the stomach should draw drink unto them, Horses should be thirsty all the day: Therefore the drink ought of necessity to remain in the stomach so long, as that it may expect there an end of future digestion, least the four Liquor be drawn into the veins, which is plainly hostile, or least the Cream being half cocted, be supped up by the veins, before the appointed time. Therefore there is another use of the veins of the stomach, than that which is of the meseraick veins: And therefore the Argument objected falls to the ground: because the meseraick veins are the stomach of the Liver, and there is not another besides those: the veins of the stomach are not likewise that which are onely dedicated to the nourishing of the stomach. Again, whensoever the *Pylorus* is not exactly shut, it happens (as in long drinkings) that the stomach doth almost with a continual thred, as it were make water downwards, by dropping into the bowel: but in those that have Fevers, whose *Pylorus* doth erre through too much straightness, the drink doth sometimes remain a full three dayes space, and at length, more is cast back by one onely vomit, than was taken in two dayes; which thing surely doth oppose that, that the veins of the stomach do attract juyce. It hath oft-times befallen me lying in a Coach with my face upwards, that I should hear through the jogging of the wayes, my stomach to contain a Chyle floating in me like to a Bottle half full: but that I have often gone to bed after that, without a Supper, or drink; yea that I felt my stomach in the morning, as I did the day before: Wherefore I being somewhat curious, have provoked my self to vomit, and I vomited up Cream somewhat sour, plenteous, transparent, so that my teeth were astonished by reason of the sourness; and although I felt no burden before vomiting, yet after vomiting, I perceived an easement or lightning: whence I observed,

First of all, that if the veins of the stomach had now sucked the Chyle 20 hours, I had not been as yet able to have cast back so much, from a moderate yesterdayes dinner.

2. That the four Cream is not allured, by the veins.
3. That that fourish Cream was not as yet dismissed from the stomach, not indeed through the vice of digestion, but through the error of the *Pylorus*.
4. That digestion differs from the expulsive faculty, if one be perfected, the other being absent, or failing.
5. That now and then, the digestion beares the unguilty fault of the expulsive faculty, and this of it.

6. That

6. That as I did offend by too much shutting of the *Pylorus*, so drinkers do offend by a too much negligent bolting of the *Pylorus*.
 7. Moreover, at the beginnings of Diseases things are often cast back, which were taken three dayes before.
 8. That it belongs not to the veins of the stomach to attract the Cream.
 9. That nevertheless the Doctrine remaineth, which hath made it a foolish thing for a Clyster to be injected by the fundament, for nourishing of the sick.
 10. That the upper orifice of the stomach in Fevers, offends by too much opening and thirst; but that the *Pylorus* errs through a strict closure of himself.
 11. That in Fevers, both digestion, and also expulsion do offend.
 12. That the Key of the Orifice or upper mouth of the stomach is in the Spleen, and that of the *Pylorus*, in the Gaul, by reason of the divers seats of a twofold ferment.
 13. That the reason of Scituation for the Spleen, and Gaul, is from the reason of their office.
- 42 For indeed, the Schools do extend the first Region of the Body from one extreame, from the mouth even into the fundament; and from the other extreame, even into the hollow of the Liver: But I do describe the Regions by digestions, seeing otherwise, without these, a Region it self is a Being of Reason: For what doth it belong to a digestion, that there is the utterance of an excrement? what doth it pertain to the stomach, that its drosse departs thorow the fundament? For the Dung of the intestine is no more the excrement of the stomach, than sweat is: therefore if the fundament belongs to the first Region, by reason of the excrement of the stomach; therefore also, the Skin shall belong to the first Region by Reason of sweat, and the Bladder by reason of Urine. Therefore not an excrement; Lastly, not the departure hereof, but digestion alone, doth prescribe a limit unto a Region; and therefore, there are as many Regions, as digestions.
- 43 In the next place, the shop of sanguification is not the Liver it self in its own substance: because even the Liver of Fishes should also make their venal blood: but yet seeing every thing generates the like to it self, it should of necessity be, that either the Liver of Fishes should be red, or their blood to be white; both whereof are false: whence we learn, that sanguification it self is made in the Liver its own stomach, which is the manifold vessel it self of the Mesentery: Otherwise, the Liver hath too few and slender veins for the due perfecting of the juyce of so great a heap: For out of them, the last perfection of sanguification is inspired into the hollow vein on the venal blood, by the ferment of the Liver.
- 44 And the Schools do think, that sanguification is made by an actual nourishing warmth of the Liver, and Cream; because they are ignorant of any other actions, than those which happen through a daily touching or comprehending.
- 45 And therefore also, that every Agent ought necessarily to suffer, by reason of a resistance, a re-acting of the Patient; and that is the unexcusable containing cause of our death, because the radical heat (For they hold it a firm thing, that they have attributed all things to heats, and colds) being by degrees wearied by the re-acting of Patients, should be extinguished: which two Maxims of *Aristotle*, having more place in the *Mathematicks*, than in nature, have deceived the Schools: which thing I shall elsewhere abundantly prove.
- 46 In returning to our purpose, I conclude, that the Gaul, and the Liver do perfect their own offices, not indeed by a corporeal co-touching, congress, or co-mingling of themselves; nor lastly, by embracing, or receiving within their own bosom: But the Gaul dismisseth its own Fermentall Blas into the bowels, and the Liver his into the veins of the Mesentery: which actions, although unaccustomed in the Schools, I will demonstrate in its place.
- 47 Furthermore, the Schools stand amazed, why windes cannot passe thorow the Coats of the intestines, in wringings of the Bowels, while notwithstanding so great a glut of Liquor is every day, abundantly snatched into the meseraick veins, and yet Pores are not seen in the intestine, thorow which so much Liquor may daily hasten into the veins: yea neither indeed, although after death, the Bowel being swollen with winde, is strongly, and even unto its bursture, pressed together. Truly as oft as by heats, and colds, figures, and similitudes of artificial things, (which are of the Schools Instruments, and sacred Anchor) they do not attain the thing; they presently fly to miracles, or at least to the hidden Mysteries of things: being frighted away by the greatness, or unwontedness of the astonished matter, they with the sloath of a narrow search, acquiesce in the admiring of hidden properties.
- 48 *Paracelsus* for the framing of Medicinal Vitriol out of Brasse, bids old or decayed Salt to be hanged up in a Brasse Kettle of hot water, in the bladder of a Swine, and so that the whole Salt will presently be dissolved: wherewith he bids the Plates of Brasse to be anointed, and promiseth that Vitriol will be bred in the Air. I was indeed as yet in my young beginnings,

things, yet I knew from Phylolophy, that Salt could not be resolved into Water in its own weight, without its substantial transmutation: yet on the other hand, the authority of *Paracelsus* perswaded the contrary; to wit, *That without the adjoyning of water* (for else the Bladder should be in vain) *the salt should melt into water*. Wherefore I being a young Beginner, decreed to try the rash monstrous assertion of so great a man: But presently by a slow or gentle heat, I found the water in the Kettle to be not much less salt than that which was in the Bladder, whose neck was tied fast to the handle of the Kettle appearing above the water; from whence I knew, that the water did pierce within and without the Bladder; to wit, That the Bladder was passable by Salt, and hot water, but not by air: For seventy seven parts of rain water do resolve twenty three parts of dried salt: But whereas one of the seventy seven parts of the water flies away, a crust of salt swims on the brine. Therefore *Paracelsus* doth vainly command by a Bladder, those things which are commodiously done without it: And that, besides the supposition of a falsehood hitherto. Therefore I observed that a Bladder is Pore in a degree of heat, but not in the heat of our family-administration: Hence therefore I gathered, that throughout the Conduit of the Veins, the Bowels do abound with more, and very small Pores, than elsewhere, to which Pores others should answer being passable throughout the Conduit of the veins. Therefore the Cream doth pass thorow the bowels, partly by its imbibing of them, even as Salt water doth a Bladder, and partly by a proper sucking of Sympathy thorow the aforesaid Pores, open indeed in our life time (even as also in heat, waters do pierce a Bladder) but shut in the time of death. But wind is not imbibed by the Bowels by moistening, neither is it sucked by the Veins, and therefore neither doth it for this cause pierce the Bowels: And that especially, because it wanteth the drawings of agreement, and a motive Blas, whereby the wind the severer of things to be drawn, may be drawn, and doth resist. The Veins therefore that are dispersed between the double Coat of the stomach, do want the aforesaid Pores: but the porous ones, with which outer Coat they being encompassed, do swear thorow them the elementary venal blood: And so the proper Kitchen or Digestion of the stomach is from without to within; But the Kitchen which is made universal in its hollownels, is there also wholly composed and enclosed; And that, least the digestion of them both should breed confusion. Indeed, there is a twofold Cook in the Stomack; one from the Spleen; and the other being proper to it self sends forth divers digestions. Moreover, the sharp ferment in the Stomack dissolves the meats into juice; but the ferment of the Gaul, by salting the four Chyle, doth separate the juice for venal blood, and from thence doth with-draw the Liquor Latex, Urine, Sweat, Dung, being yellow and liquid, and the parts of a thicker Ballast. Neither therefore is Digestion in the Stomack, a formal transmutation of meats.

For example; for Magisterials among *Chymists*, do indeed melt the body of a thing, and do open it with a separating of some certain dregs also: Yet they do not therefore include a transmutation of it; even as neither doth Salt being resolved, differ substantially from it self being dried; Because the same seminal *Archeus* is as yet on both sides chief Ruler. So neither in an egge is there a formall transmutation, although at the time of nourishing heat, the yolk doth melt and contract a stink; but they are onely material disposures required unto a formal transmutation, resulting at length from thence again. Neither is the Digestion of the Gaul in respect of the lively Cream, as yet reckoned a formall transmutation, although in respect of excrements, it doth formally transchange: For the unlike parts of the Cream, of which an elementary application is not intended for them, do putrifie through a dungie ferment, and are deprived of their middle life, as also of an *Archeus*: But there is onely pretended a transmutation of the Homogeneal Cream, as also an enjoyment of the same.

Therefore meats are not truly and essentially changed, unlesse when the venal blood is made in one part; and the dung in the other part is fully become putrified. Also the bowel deputed for the making of venal blood, cannot be at leisure for preparing of yellow dungs in the *Ileus* and *Colon*: And the dung differs from the earen meat essentially, but it must not be believed to be putrified in a few hours by heat onely, the which, neither is it turned by heat into a certain kind of Cream, but by the proper ferments of the Kitchins. Therefore the meat is not yet fully transchanged, unless when its own *Archeus* being subdued, our vital one is introduced with a full vassallizing of the former: For so wine is wholly changed into *Vinegar*, *Quick-silver* wholly into Gold, an *Egge* wholly into a *Chick*, and the blood wholly into the last nourishment.

From whence I conjecture it to be a falsehood, that there is no nourishment without an excrement: For the Schools have meditated of dungs: and have not minded that Homogeneal things do onely concur to generation: Therefore, although before the transmutation of the food, there are made the separations of dregs; Yet that afterwards, dregs are no more made in transchangement; to wit, after the obtaining of Homogeneity or parts of the same kind:

For

For a separation of dregs from that which is Homogeneous is impossible, wherein one thing doth not any thing differ from another : But in meats, or under the first ferment, there is a diversity of kind, by reason of the difference of the meats, and parts of the same, the unequality of chewing, and an unlike application of the received ferment : For the food doth partly hearken the more easily to the ferment, and being partly rebellious, doth resist ; whence also a disagreeable capacity of the ferment doth arise.

52 That also of the Schools is false, *That the stomach doth primarily coct for it self ; secondarily, only for the whole body, and so that it self is truly nourished by a soulish Chyle : And so that if it should not be nourished by its own Chyle, neither would it begin, or attain a Cocture ; Because that from the self-love of nature, every thing doth act intentionally for it self.*

1. If that thing may have place in a totall Agent ; yet surely not in the direction of all particular parts.

2. Because no part doth act any thing in the body from a proper pleasure of self-love ; and much lesse do the shops dedicated to the service of the whole, so act : But nature doth on every side obey the appointments of the Creator, which were measured out by use and necessity, in the power of the Lord of things.

3. We are nourished by the same things whereof we consist ; but we in no wise consist of the Cream.

4. The stomach is nourished with no other matter than the other rank of membranes, which is destitute of the Cream.

5. The Cream doth not receive life, but by the Degrees of venal blood ; but the stomach cannot be nourished by a nourishment not yet vitall.

6. The Cream is a melted food, having as yet the *Archeus*, and Properties of the food ; but spermatick and similar members of the first constitution, cannot be nourished by a liquor not yet limited unto a humane species.

7. The veins are not dispersed into the stomach that they may suck venal blood ; but that they may diffuse nourishment ; But they do not contain the Cream : Therefore the family-administration of the Members being unknown, faulty arguments, from not the cause, as for the cause, do every where sprout forth in the Schools, and do bring forth capital errors, and deaf experiences, to be purged in another Tent.

53 *Francis Alvarez* an eye-witness writeth, *That the Abyssine, or Ethiopian Nobles are delighted in their feasts with raw Oxe flesh, with a seasoning, or sauce of its own Gaul, yet they are not any thing weaker than the strongest Europeans.* If therefore the Gaul be an excrement (as it hath pleased the Schools) and of so great cruelty (as they think) that the Gaul being detained in the stomach, doth produce a fainting of the Spirit ; yea that within few dayes, Choler, through a disease, doth kill us : How shall a raw and cadaverous Gaul, make men sound, and the more strong ?

54 Perhaps they will object ; *If the Gaul be so necessary a Bowel ; Pigeons or Doves could not want that :* But they know not that the situation of the Members, and heart in a Pigeon, is turned upside down : For if an Emmet hath his Choler in him, Pigeons have also their Gaul ; although it be not bitter, nor distinguished by a little bag, as neither in Emmets : For it is sufficient that the Blas of the second digestion is established in another part : For the heart of a Pigeon sits in the four Lobbs of the hollow of his Liver, they being overwhelmed above, and its bunch hangs forth downwards : The Pigeon being a great fighter even unto blood, doth want a little bag of Gaul : But the Lamb hath a large Gaul, even as also every the least, and mildest of fishes. *They gave me Gaul to eat, and in my thirst they gave me Vinegar to drink.* That was wine of Myrre mixed with Gaul, which they offered to the Saviour of the world, now fainting with the pains of an unwonted passion, and wearied out with the weight

55 of his own Crosse : Not indeed that he might presently swoon, even as otherwise they are threatened with fainting, who undergo bitter vomitings (which the Schools falsely call *Gaulie ones*.) The *Jews* therefore, did acknowledge the Gaul for a Balsam preserving life ; and it far differeth from that yellow poyson rejected by Vomitors : Therefore the Sacrilegious did offer Gaul, whereby they might the longer torment the Lord Jesus under pains, before death. Therefore the Gaul if it be a Bowel, and its action be altogether vital, it can scarce be restored, and at least, is by no means delighted with material Remedies, as neither with solutive ones ; but with an equivalent ferment, of the nature of a Blas : for there is a certain immediate and mutual traduction or passing over, and easie operation of powers into powers ; Because there is a touching of each other, and that mutual, in a co-resemblance, and therefore also a piercing one.

56 For I remember that I saw the dissected dead carcass of a certain Comptroller to a King, & of another

another, a School-master, who were dead of the yellow Jaundise, yet the emunctory of neither Gaul was brought close to the *Duodenum*; but in some of the Meſeraick Veins, were pellets, which I judged to be liquid dung there detained, molesting the action of the ferment of the Gaul: also sorrow hath oft-times given a Beginning to the Jaundise and doth nourish it being begun. If therefore sorrow doth inhabit in the Spleen, the seat of Melancholy (according to the Schools) why therefore should the Gaul be stopped from sorrow? and not the Spleen? Therefore,

1. Sorrow doth not only hinder the digestion of the Stomack, but also of the Gaul; By the error whereof, the liquid Dung, which is especially carried through the Fundament, doth immoderately, and unreasonably arise into the veins.

2. Therefore the Gaul is a noble, and vital Bowel.

At length, The Cream sliding out of the *Pylorus* or neather mouth of the Stomack, into the *Duodenum*, being straight-way snatched within the Sphear of activity, by the in-breathing of the Gaul, doth exchange its sourness into Salt, and its more watery part is made severable from its more pure or un-mixt part, which is drawn by the Reins.

Whence the Urine is sufficiently salt; but the venall blood, a little. But that *Paracelsus* will have the Urine to be brought into the bladder, not by the Reins and Urine vessels; but by the habit of the flesh that is indulged by his own Idiotisme or Property of speech: Even as also that, *That Oyls and Emplasters are the true food of wounds, so that a wound is truly nourished by them, and that the corrupt matter is the excrement of that nourishment.* Therefore the sour salt of the Cream, seeing it is destitute of an object; and the which, seeing it wandreth through the action of a dissolver, into a fixed salt (as I have taught before concerning volatile spirits) it is suitably exchanged into the volatile salt of Urine; And that not by the action, or re-action of sourness on a certain object, but by a true fermental transforming; for the Spirit of life it self is of the nature of a volatile salt, and of that which is salt: And so even from hence alone, the vital action of the Gaul is proved: For Sea salt being oft eaten, doth remain almost whole in the excrements.

Which thing the Boylers of *Salt-peter* do experience against their wills: For they are constrained to separate salt out of the dung of *Jakeses*, being sometimes eaten up by the *Salt-peter*, through a repeated boiling, and coagulation of cooling: For the Sea salt being coagulated, doth stick fast to the spondils or chinks of the vessels, being nothing changed from it self long ago eaten; And that, before the *Salt-peter* hath obtained a sufficient drying up of its own coagulation: And therefore from hence it is known, that Sea-salt is more readily coagulated than *Salt-peter*: Therefore humane excrements are lesse fit for *Salt-peter*, than otherwise those of Goats, Sheep, and Herds: Yet as much of that Sea-salt as is subdued by the ferment of the stomach, so much also is sour, and volatile: Consequently also, although any one do use no salt, his Urine should not therefore want salt; because it is that which is a new creature, and a new product out of the sour of the Cream: The Salt of the Urine therefore hath not its like in the whole Systeme of nature: For not that of the Sea, Fountain, Rock, Gemme, nor Nitre, not that of *Salt-peter*, Alum, or Borace; Lastly, not of any of natural things, as neither the Salt of the Urine of flocks or herd, with which although it may agree in the manner of making, yet the salt of mans Urine disagreeeth from them throughout the general and particular kinds; no lesse than dungs do vary throughout the species of *Bruits*, although bruits are fed with common fodder, to wit, by reason of the diversities of an *Archens* and Ferment: Therefore of meats, and drinks, not sour, or salt, is made a salt four, and at length a salt Salt, and it is easier for a thing of a four salt, to be made Salt, than of not Salt, to be made four salt.

I remember that I have seen a *Chymist*, who every yeer did fill a Hogs-head of *Vinegar* to two third parts with water of the River *Rhoan*: he exposed it to the heats of the Sun, and so he transchanged the water in it self without savour, into true *Vinegar*, a ferment being conceived out of the Hogs-head: This I say he was thus wont to do, by reason of the singular property of that *Vinegar*: For truly, out of the *Vinegar* of Wine, the weaker part doth alwayes drop or still first, but the more pure part a little before the end, riseth up with the dregs: but this *Vinegar* made of meer water, as it wants dregs, so it alwayes doth minister an equall distillation from the Beginning even to the end. Wherefore as the ferment of a vessel doth by its odour alone change *Water* into *Vinegar*; So indeed, by the fermental odour of the Spleen breathed into the stomach, meats are made a four Cream, which afterwards is turned into a urinous salt; yea, and into a vital one: Because the Schools never dreamed of these things, neither had their followers read them in the labours or night watches of their Predecessors, therefore they have been ignorant of the use of parts, and ferments, and the celebrations or solemnities of transmutations, but they have introduced both the Cholers into the masse of the blood: Lastly, They have not known the Contents and be-tokenings of the Urine:

Therefore the third Digestion is made by the President-ferment of the Liver; which is by the blind odour of a Gas; doth begin Sanguification in its own stomach of the Mesentery, and at length perfecteth it in the hollow Vein.

60 Furthermore, The fourth Digestion is compleated in the Heart, and Artery thereof; in which elaboration the red and more gross blood of the hollow Vein is elaborated, made yellow, and plainly volatile: For the heart is said to be eared on both sides, and hath at its left bosom, one onely bearing Artery, inserted in a great Trunk fit for it, that by a double rowing, it may the more strongly draw the fenced venal blood which is between both bosoms in the middle of the heart. Refer thou hither, what I have above noted concerning the porosity of the hedge or partition which distinguisheth the bosoms of the heart, and why the Arterial blood doth not return from the left bosome into the right, but only the spirit of life as it were through a thin sieve. Therefore the venal blood of the Liver, differs from the arterial blood, by the fourth digestion, manifested by the colour, and consistence of the matter digested.

62 But the fifth Digestion doth transchange the Arterial blood into the vital spirit of an *Archemus*, of which I have discoursed under the *Blas of man*, as also under *The Spirit of Life*. I could not satisfie my self, that in the venal blood of the Liver there was any spirit, although it hath gotten a degree of its perfection, after that it hath overcome or exceeded the Mesentery: But that venal blood alwayes seemed to me as it were a certain Masse of Mummie, and the matter *Ex qua* or [whereof:] But not as yet to be accounted for perfect vital blood.

63 For if the blood of the hollow vein had begged a spirit from the Liver, the right ear of the heart had been in vain, which works uncessantly for no other end, than that some spirit may be drawn from the left bosom thorow the fence of the heart, that the blood in the hollow vein nigh the heart, may begin to be quickned by the participation of that spirit: But seeing from the left sides there is an ear, and especially the notable Trunk of an Artery; hence also the sucking is stronger from the left bosom. And from hence by consequence also, little of the vital Spirit is communicated to the venal blood: For truly, the blood of the Liver is alwayes throughout its whole, moist with too much liquor, whereof it ought to be deprived before that it be made a fruitful and worthy support of spirit; neither finally hath the Liver had a fit hollownes in it self for the framing of spirit. Wherefore as I have intellectually, seen throughout the whole Scene of Generation, one onely Framer, and Ruler of the spirits of life in the seed; So also, I admit of one onely spirit of the vital family-government.

64 For the venal blood slides indeed within the stems or threads of the Muscles, and is made flesh, but it doth not easily transcend unto the Bowels that are to be nourished, and to the threads or fibers of the flesh: For an infirm man being extenuated by a long disease, a recovering even after youth, doth easily retake the former state of his flesh; but he which is waxen lean by the vice of a certain Bowel, doth not therefore likewise rise again unto his former state: And this is the difficulty of healing the Consumption, and of healing the Ulcers of the Bowels, whereas in the meantime, external Ulcers being far worse, are healed by Medicines taken in by way of the mouth; although they are at a farther distance from the mouth than internal Ulcers: Because the Bowels and inward Membranes are nourished by Arterial blood: more than by Venal blood. But life hath received its bound from God: Therefore also whatsoever things are nourished by vital blood, they stop their increase at a certain number of dayes: Whereas the while, the flesh of the Muscles (which is nourished onely with venal blood, and the fibers of the Muscles which are nourished with Arterial blood) doth uncessantly increase as oft as it faileth, and groweth up to a hugeness, to the destruction of some: So also broken bones are made sound by a bonie callous matter, at any age. But seeing the Bowels do cease to increase, all the spermatick fibers also, and those of the first constitution do cease from growing: For which of you shall adde a Cubit unto his stature? For I have observed that women with child being long afflicted with notable grief, have brought forth the less Young.

First of all therefore, I do not admit of a Livery spirit to be in the venal blood. And then, neither do I distinguish the Animal spirit from the vital: For truly in one onely ship, one only Pilot stands at the Stern, neither do more suffer themselves to be together, without confusion: Neither do I admit of a new Digestion for animal spirits in the bosom of the brain.

65 Like as also, that the spirit doth not differ in the species, from it self, in all the particular Organs of the Senses, and Executors of Motions: Although the senses differ among themselves in the Species, as also from motion: So I think it to be a confused argument, that deviseth many *Archemus* to be in a man: For although the Gas shall draw a singular disposition from

from the instrument, yet this doth not prove a specifical diversity. Therefore in the Fourth, 66
and fifth Digestions, there are no excrements, nor unlike things or parts, nor do they proceed
from them.

And therefore it is false, That in every nourishment there is an excrement : For the arte-
rial blood, and spirit do agree in a simple and vitall unity. But if any superfluities of the former
Digestions do rush into, or are ingendred into the Arteries, let that be a disease, turbulent and
confused government : I now speak of the ordinary Digestions.

At length, the sixth and last Digestion is perfected in all the particular Kitchins of the 67
Members : And there are as many stomachs, as there are members nourishable. Indeed, in
this Digestion, the in-bred spirit in every place, doth Cook its own nourishment for it selfe ;
under which Digestion, as there are divers dispositions incident, so also divers errors of those 68
dispositions do happen : And so the diseases which the Schools do attribute unto their four
feigned humours, should rather be owing unto things transchanged:

But I call things transchanged, dispositions, which afterwards do in the Arterial blood,
consequently succeed into the true nourishment of the solid parts. The Schools divide these 69
transchanged things into four successive cōfary dispositions ; and as if in these, no error
could offer it self, they have forgotten the diseases which from hence ought to be attributed
to a rank or order. Indeed, they say the first is, because the venal blood doth within the ex-
tremities of the veins, obtain the Muscilaginous substance of a raw seed. Presently in manner
of a dew it is diffused or falls out into the empty spaces of the flesh.

Thirdly, When it is now applyed to the solid parts.

And lastly, When it is assimilated or made like to the thing nourished, and is truly in-
formed hereby, it assumeth the nature of a solid part; which to be the dross of the Schools,
surely they do not diligently mind.

For in the first place, Neither the Arterial, or Venal blood do wax white in the extremi-
ties of the Veins, seeing the extreame or utmost parts are not potent with any other power of
a shop or office, which its whole more former Channel of the Vein hath not: And so the Vein,
although it be the vessel of the prepared nourishment for the Kitchins of the solid parts, yet the
Vein is not the Kitchen of the solid parts. Indeed all particular solid parts do nourish their
own and proper Kitchen within. Therefore the venal, and arterial blood are not altered, unless
they be applyed to the solid parts ; Because they are diverted by the property of the solid
parts, into a raw seed, but not of their own free accord in the utmost part of the veins.

Secondly, The spermatick Muscilage is not be-dewed by the veins in a solid Member. For
a Muscilage is badly consonant to a dew. But the thin and fluid arterial, and venal blood sli-
deth along within the Kitchins of every part, which are only transchanged by the ferment of
the place.

Thirdly, Neither are there empty places of flesh, which are devised to be greedy of a
dew.

Fourthly, Neither is nourishment applyed to the sound or solid parts, in manner of a dew,
which but a little before was a Muscilage.

Fifthly, Neither at length is this dew united, and assimilated to the solid parts, but whatso-
ever happens to be assimilated unto them, this is within the yeers of growth; but afterwards, as
the venal, and arterial blood have thoroughly crept into the solid members, by a continued suck-
ing of nature ; so they are there digested, and suited, and at length expelled by transpiration :
Therefore these four Dispositions feigned by the Schools, and badly harmonized, I meditate
to be digested into a Quaternary number (for peradventure a hundred Dispositions do inter-
pose, before of an Egge, of a Chick, a solid part I say be constituted of Arterial blood) with the
blemish of the blindness or giddiness of the Schools: wherein nothing is right or true, but they
do behold the very history of the matter bespotted, and to them it is a truth, because they
have no nourishment of truth without the excrement of Fables.

Therefore also the veins themselves, as they are nourished only with the Arterial blood of 70
the first constitution, even so also in this respect perhaps, an Artery doth every where accom-
pany a vein. For from hence it comes to passe, that through the more cruel issuings of blood,
at last, not venal blood, but a whiteness flowes forth, or the immediate nourishment of the veins,
by reason of the penury of venal blood.

But Paracelsus every where bringing nature over to his own desires, saith, *That in the Di-* 71
gestion of the stomach, a stinking or putrified Sulphur is seperated from the two other Beginnings:
But in the Liver, that the salt is seperated from the Mercury; but the venal blood to be the Mercu-
ry, and the true nourishment of the whole entire part. Neither is it worth ones labour, by scot-
sing at this man, to be drawn any longer on the Stage, while himself doth infringe this his
own Doctrine : For he diligently searching into the original of Ulcers, saith, *That the whole*

venal blood is nothing but the salt (now he makes no mention of *Mercury*, unlesse he confoundeth the *Mercury* with the *Salt*, in name and thing) although the urine of those that are ulcerated doth not contain a crum of salt less than themselves not ulcerated. But surely it is a shamefull thing to reckon the three first things of the venal blood, as if they were excrements, whose Arterial blood is one of the three. Also he every where compareth Milk to the Arterial blood; Not knowing that a thing transchanged, is not any more like it self being not transchanged, as neither is a Chick like to an Egge, or to an Yolk. Indeed he calls the Buttery part of the Milk swimming upon the Milk, the *Sulphur* of the Milk (never in the meantime, not indeed Analogically, doth the Buttery part swim upon the Arterial blood) but the Cheefe or Curds he calls the salt of the Milk; therefore also the Whey of the Milk shall be also the *Mercury* of the Milk, and by consequence its best part, and the best nourishment of the Milk: And the Whey of the Milk shall be the *Mercury*, out of the *Mercury* of the Arterial blood. I will willingly, and smilingly grant *Paracelsus* the Whey, and will my self take the Cream; Because the Butter resembles the smell of flowers, where-with the Cow is fed; but not the Whey.

72 But *Fernelius* thinketh Butter to be nothing but the froth of the stirred Cream: not knowing a presupposing of a four ferment in the Cream, that it may be truly transchanged into Butter by shakings together: For from hence, if a little *Ashes*, *Soape*, *Sugar*, or of those things which do participate of a Lye or *Lixivium*, be immingled with the Cream, there will never be Butter made thereby, by reason of an *Alkali* which slayeth every four Ferment: For therefore in Winter, the co-shaking of the Cream is more tedious, before the Butter be brought forth; because heat doth promote four things; and all putrefactions.

73 But *Paracelsus* being elsewhere unmindful of his own Doctrine, doth prefer the Cream before the Whey, and Cheefe, as well for health, healing, as for the goodnesse of the food: But the *Galenical* Schools do prefer the thin and waterish Milk before the more fat Milk. For this cause they determine Ewes Milk to be the vilest, and then Cows Milk; Thirdly, Goats milk; And at length, they prefer Asses milk before the rest, by reason of its thin substance, and very much wheyiness. But I know, that this one only Milk of beasts fed in dry pastures, is the best, as well in healing, as in eating, and to be least wheyie: For they command a Goat (let the same judgement be of Milke where the like reason appeareth) whose Venal blood the Schools do prescribe in the Shops, and in many places Sheeps blood is sold for Goats blood) to be first nourished with things *Diuretical* or provoking Urine. Therefore the virtues of Milk are to be measured by the soundnesse, life, and meats of the Beast, but never by his grossnesse or farnesse.

And Physicians being called to give their judgement of Milk in a Nurse, do come badly instructed; neither are they ready to judge otherwise, than of the venal blood drawn out by *Phlebotomy*: That is, minds being blind through ignorance, do not see with open eyes. I have observed also, that of the same Cow, of the like quantity of Milk, there is an unlike quantity of Cream, although she rejoyce in the same pasture; for that also is according to the unlike soundnesse of the Cow.

75 But I, for Blood, hang up a He-Goat by the horns, and do bend his hinder legs to his horns: I cut off his Testicles; and his Venal blood being received from thence, I dismisse him without blood for the Butcher. But this venal blood being dried is like unto glass, and of a most difficult sitting, and very far differing from the Goats blood of the Shops. But it being taken in the weight of a Dram, doth straight-way cause sleep, and cureth the *Pleurisie*, &c. without cutting of a Vein: Neither will it ever fail thee.

76 For Asses Milk doth more refresh and recreate or renew, yea and thus far it nourisheth; not as it is more wheyie; For that is to have judged of the virtues of a Kernel never before seer, by the shell. But a she-Asse, as she is long-lived, her Milk is more excellent than that of other four-footed beasts.

77 For it must needs be, that her Milk also hath an *Archens* endowed with a long life: And for this cause indeed, her Cream doth not seporate it selfe till a long time after: Because it doth more slowly hearken to corruption: For that sequestration doth tend unto a duality and destruction. Hence it is manifest, that seeing in child-hood the nourishment is converted into our very Constitutives, Asses milk doth more conferre a long life, and healthier, on Children, than other foods.

78 Wherefore also, Womens milk, although it be most like unto us, immediate, mumial, and nourishable, yet it gives place to Asses-milk for long-life. But the she-Asse is to be combed like unto Horses, and so it may be known by the taste of the milk, whether the Asse were combed that morning, or not.

Therefore

Therefore let the Schools learn a better judgement concerning Nurses, concerning Milk, 79
and Diet; likewise to judge of the contents of the Urine, nor to acknowledge Choler, or
Gaul in the Urine, or Dung; Let them know I say to distinguish the Urine of the venal blood
from the Urine of the drink: and then, that the drawing of Liquor out of the veins of the
Mesentery, doth cause natural thirst, but not from the exhausting of the lesser veins, by rea-
son of the impoverishing of the venal blood. For otherwise Physical or consumptional persons 80
should alwayes thirst, and more than those that have the Dropsie; and the repeated thirst
should bewray a repeated Consumption of the blood, distinguished by small intervalls.

We must also know, that at the end of the Bowel *Ileos*, there is a little Sack, which they 81
have called the blinde gut, in which the ferment of the dung resideth; the which, seeing it is
the work of corruption, and not of nourishing, its putrefaction is never to be accounted among
the digestions of nourishments: For the ferment of the dung doth not proceed from any
Bowel, or vital faculty; and therefore in this terme of mutation, more secure wringings do
happen, while the matter seasoned with a dungie ferment, doth go back, or contract the sud-
den stains of a defiled putrefaction. Moreover, the blinde gut is small, yet the necessary re-
ceptacle of all dung: which is manifest: For indeed, a Wolf, hath beneath the middle of his
intestine, two membranous Bottles, or little round Sacks, which are to him in the room
of a blinde gut: For his meat falls from a long conduct of the intestine, into one of the little
Sacks, but presently into the other; and at length it is brought hence into the following
bowel.

But humane Worms are not generated in the *Duodenum*, and much lesse in the stomach: 82
yea, if they should the longer remain there, they would be digested after the manner of the
food: For whither the Ferment of the Gaul doth not reach, there is the Worms country:
For they are made of nourishment half digested, the which when it is brought down unto its
own places, it is incruited with a skin, as it were luke-warm Milk, and it beareth, and by de-
grees is endowed with life: For Worms do scarce creep upwards out of their vital nest, un-
less by reason of an obstacle horrid unto them, and of an ill contagion; and so they do scarce
presage any good, which are voluntarily ejected upwards: But Worms do presuppose a Fer-
ment of the Gaul.

For otherwise, in the *Celiac* passion, worms should be continually stirred up: For the 83
Cream would presently putrifie, unless the Gaul did presently season the Cream with its Salt.
In the right or straight gut, about the end of the Colon, *Ascarides* do come forth, which are
not Worms of the substance of man, or bred of the Cream; but of putrified superfluities, even
as in Flesh, Cheese, Fishes, and Ulcers, Worms do come forth. Therefore *Ascarides* are
cadaverous or as from a dead Carcase, Worms not so. Lastly, Worms are in us without in-
crease of off-spring; but *Ascarides* do bring forth their own Eggs. Common water boyled
with Quick-silver, in a little, and unhurtful drink, killeth all Worms, as well in the Bowels, as
elsewhere; but in Ulcers, if that water be powred on them. Last of all, for an over-plus, I
will add, seeing the Bowels wherein Worms are bred, cannot digest the same; thence it fol-
lowes, that Clysters put up for to nourish, are frustrate of their hope, and they shall sooner
nourish Worms, and *Ascarides*, than the man.

Nature therefore, hath with me, constituted six vital digestions; But in the seventh num- 84
ber she her self resteth.

CHAP. XXIX.

Pylorus the Governour.

1. *The use of the Pylorus delivered by the Antients.* 2. *The chief Diseases of the Pylorus.* 3. *He is the Moderator of the first digestion.* 4. *Of what sort the closure of the Pylorus is.* 5. *The Command or Government of the Pylorus.* 6. *How vomiting happeneth.* 7. *The Blasphemies of the Pylorus.* 8. *The Stern of the first digestion.* 9. *The Eccentricities of the Pylorus.* 10. *Some Originalls of Diseases neglected by the Schools.* 11. *Some Positions.* 12. *Whence the diversity of matter vomited up, is.* 13. *What that gawly thing may be, which is cast forth by vomit.* 14. *The sluggishness of the Schools.* 15. *Their ridiculous admonition.* 16. *The shutting and opening of the Pylorus.* 17. *The reason of the Scituation of the Gaul.* 18. *Whence Fluxes, wringings of the Bowels, Bloody Fluxes, the Hemorrhoids or Piles, &c. are.* 19. *An error about hunger and thirst.* 20. *Some absurd consequences upon the positions of the Schools.* 21. *A sense of appetites in the Pylorus is demonstrated.* 22. *The remedy of the Bloody Flux or Dysentery, and Flux, hath opened the office of the Pylorus.* 23. *Giddinesses of the Head, whence they are.* 24. *An example in a Cock.* 25. *The leekie Liquor of the stomach, is not that of the Gaul.* 26. *Thirst doth not shew a necessary defect of moisture.* 27. *Whence there is a yellow and bitter vomiting at the beginning of a Tertian Ague.* 28. *The use of the Pylorus is confirmed by four Histories.* 29. *Thirteen notable things resulting from thence.*

IN what part the Stomach layeth open at top, and being conjoynd to the throat, doth lay under it, that by the figure *Antonomasia*, is called its Orifice or mouth: But its utterance beneath, is named the *Pylorus* or Porter: For in those that are well in health, the *Pylorus* is shut, while the Stomach hath received the meats, or drinks, untill that the digestion of the Stomach being finished, the Chyle or Cream be made.

1 For then, not before, the *Pylorus* openeth himself: but the orifice of the stomach is shut, at least, fulness being present (if there be not sufficient cast in) when the stomach begins to give it self up to the performance of its office. These are all things that I have hitherto found delivered by the Schools concerning the *Pylorus*: But I have apprehended a great hinge of health, and sickness, to be involved in the *Pylorus*.

2 For first of all, I have seen now and then, in Fevers, that as to day, undigested things have been vomited up, which were the third day agoe cast in: But on the contrary, in the *Celiac* or belly passion, the *Pylorus* is never shut: Yea some, after that they have been filled with dainty fare, they do not desist from rioting all the night, and therefore they do pisse continually: Therefore it must needs be, that their *Pylorus* being notably passable, doth not onely distil drop by drop, but by a continual thred; neither that it doth expect any bound of coction: For straightway even from the beginning, that it was not suitably or exactly shut, or at leastwise, that it doth somewhat lay open in divided wrinkles, after that the stomach was not sufficient for the entring drink: For that happens in healthy persons, when there hath been a defect of the closure of the *Pylorus*. There are others also, whose *Pylorus* is a more stubborn keeper, they vomit drinks after they are half digested: because the digestive faculty being not equivalent to the drinks received, being provoked, doth cast forth the whole. Indeed there is too much obstinacy of the *Pylorus*, where three dayes meats are cast forth.

3 Which things surely do convince, that the *Pylorus* is not onely the Porter, but also that it doth govern the first and most evident digestion; and so that in this respect, there is a drowsie carelesnes of the Schools: For that I may give enough to their insufficiency, I say, that

that first of all, the *Pylorus* is shut, not indeed by a muscle, after the manner of the fundament, or Bladder; for it is not the Client of a voluntary motion. Neither in the next place is it shut by contracted fibers or threads, like the Cramp, or wringings of the bowels: For it performs its office of a Porter without feeling, and trouble. But no otherwise than as the womb after conception, doth the *Pylorus* shut his neather mouth on every side, by his own proper Blas: thus I consider both the Orifices of the stomach to be shut: yet so, as that the upper Orifice, being in a healthy person once shut after mear, doth easily open it self wholly, at every importunity of a morsel, or pertinacy of a draught; seeing it can scarce endure that any thing should hang above over it in the throat: Although in sick folks, and those that have suffered hunger or want, its opening doth happen with pain and great anguish; because in the same persons, that closure of the Orifice doth depend on an inordinacy. Therefore the closure of the *Pylorus* is more obstinate, and exact, than that of the Orifice. Again, it is not to be doubted, that the motive faculty of either part doth not obey the will, and so that it is natural, or disease.

The *Pylorus* is said in the Schools, to be subject to the retentive faculty: But certainly, it sheweth an absolute power, when as the expulsive faculty being against it, the digestive failing, the attractive loathing, and so others being trodden underfoot, the *Pylorus* is oft-times stubborn, as well in its closure (as I have said above to happen in Fevers) as in its opening (as in *Celiac* passions.)

For vomiting is made while the *Pylorus* being shut, it doth contract it self upwards, not indeed by the co-wrinkling of the stomach, but by a totall motion of the stomach upwards to the throat; and so the *Pylorus* doth command vomiting, and hearkeneth not unto the retentive faculty. Seeing therefore the power of the *Pylorus* is not the Chamber-maid of other faculties, nor subjected to fibers, but Monarchal, and so that the fibers ought to yield obedience to its very pleasure; It must needs be, that this power is absolutely vital, and that it hath a proper motive Blas, like the womb, independent on the will of man: And that so much the more potent a one, by how much the *Dumvirate* of the stomach shall now come to light. And although the *Pylorus* be wearied oft-times by external and occasional causes (to wit from Medicines, Poysons, or Dregs; yet its Blas is free unto its self, which is implanted in its part, or *Archeus*.

Wherein notwithstanding, I admire a certain power from above, like unto the influences of the Stars: For the Blas of the *Pylorus* doth as near as may be, express the Blas of a free will: for truly an external inciter rushing on it, it can nevertheless at pleasure oppose as to shutting, or opening, that as long as the *Pylorus* is well in health or able, it may be moved for lawful ends, or at leastwise those that appear so to it, for the straightning, or loosening of the passage.

Yet when a man being inordinate, doth transgress against those ends, the *Pylorus* as the Governour or orderer of digestion, doth oftentimes constrain the man to expiate his offence by punishing him: But seeing there may be defects in that Blas (in some sort, as it were an arbitrarill one) not onely from occasional causes, but also in its own motive mad principle, so that through fury it doth preposterously open or shut it self freely, like the womb; Surely, it is a wonder, that these things, with the other beginnings of healing, have stood neglected by the Schools. Every power, and especially the motive, doth easily wander abroad, being stirred up as well by contingent causes, as by a proper beck of madness, seeing they are free, and as it were independent; in the error of which motive power, the *Pylorus* doth for the most part, and easily stumble: Even as the womb not being shaken from elsewhere, doth rush it self headlong, ascend, or being furious, doth wriche it self on the sides, doth alienate, straighten, enlarge, contract the throat, weasand, yea and the sinews readily serving the will, against their office, and doth now and then exhibite cruel motions, scarce unlike to magical ones, as the motive Blas is excentrical in stirring up divers Tragedies of Tempests. And these things are diligently to be attended by Physicians, that as oft as through occasion of the provoking cause, the *Pylorus* doth wander from its aims, he may straightway study a removing of the cause. But if the *Pylorus* be exorbitant through the error as it were the fury of its own proper Blas, let him think that he must fight with excentrical powers, and not with matter; and least of all, that evacuations must be trusted to. For we may think that in a temperate state, a man having eaten moderately, his *Pylorus* is suitably shut, least any thing do drop down out of his chinks; and that at length digestion being finished, the *Pylorus* doth open it self: Surely neither doth this come to passe from a forreign pricking quality of the Chyle; but because the *Pylorus* is expert of things to be done in the stomach, and therefore is to be reckoned the moderator of digestion, by whom indeed are the bounds of Government, and the Keyes are kept: For otherwise, if the *Pylorus* be shut longer than is meet, see-

ing that which was sufficiently digested doth not therefore cease to undergoe a further force of the digestive ferment, therefore also it is cocted more than is meet: Nor indeed, that the Chyle is therefore more excellently cocted like Glasse in the Furnace, by how much the longer; but through too much delay it is alienated and corrupted, which afterwards must needs bring forth very many difficulties, as well in the stomach, as in its own neighbouring parts. Notwithstanding, if the *Pylorus* be lesse exactly shut, surely the new drink cannot but be (together with its former crudities) carried into the *Bowels*; about which surely since the digestion of the stomach is not employed, a ferment of the Gaul being received, it is changed into a strange substance; and at length doth procreate divers Infirmities in the veins; because the first digestion being omitted, it is come to the second: For so inspired tremblings and shakings of the hands, beatings of the heart, faintings, sharp Fevers, Tumors, and joynt-sicknesses do break out: So the tartness of Wine being not yet corrected by the first maturity of digestion, being a stranger to the veins, with the *Aqua vita* inbred in it, doth cause the proper nourishment of the veins to degenerate with it self, and an unnamed and unknown guest doth bring forth unwonted and unknown infirmities: Even as for the most part, if the Chyle being well ripened, doth slide down into the *Duodenum*, and at the same instant, new food be injected from above, be sure, that the *Pylorus* being well appointed, is presently shut, the former baggage being not yet plainly dismissed: Therefore the detained part of the Chyle is corrupted, doth wax sour more than is meet, and defileth the new food with a fore-ripe ferment; And the whole Chyle is made a forreigner, unless that before an exact coction it be banished by the *Pylorus*, which is by exciting divers appetites, wringings, and Fluxes. Therefore the error of *Pylorus*; whether it be proper, or stirred up from inordinacy, doth cause many difficulties. But that new food sliding in, the *Pylorus* is presently closed, it is manifest; for else, the new and raw food should slide forth together with the Chyle which should appear in the excrement, as if it were bred from the affect of the passion of the belly, which is sometimes otherwise seen in devouring Children, their *Pylorus* being not yet sufficiently able to obtain its own ends. Therefore weaker stomachs do complain that great founesses do arise in them, which in the morning they do cast up with their yesterdays food, or at night, with the Chyle of the precedent Noon, and the Reliques of their last meats.

11 Furthermore, for a more full knowledge of these things, we must repeat, that it belongs not to the veins of the stomach to suck to them the Chyle detained in the stomach: likewise, that vomiting is made by the *Pylorus* being shut, and that the whole length of the stomach is contracted from the neather parts, upwards to the Orifice. Lastly, that this motion is made by the *Pylorus*, which if he should be opened, he should certainly unload the stomach of a lesse trouble; but seeing he openeth not himself, he judgeth it to be inconvenient for health, to have those dregs dismissed beneath: And so he hath seemed to me, to be the Rector or governour of digestion. But that vomiting doth happen two manner of wayes; To wit, by the proper Blas of the *Pylorus*; but then it is without pain: But the other is made by provokers; and that, although it be made also by the *Pylorus*, yet not by its own proper will.

12 Therefore also it is troublesome, and grievous: at leastwise, vomiting is not made, unless by the shutting of the *Pylorus*: Else that should fall down into the *Duodenum*, which is expelled by vomiting: For when vomiting is made by the proper motion of the *Pylorus*, all of whatsoever it judgeth to be hurtful to it self, parteth at the first vomit: But if the *Pylorus* be provoked by a repeated vomit, other things are ejected, than those which bewrayed themselves in the first vomit: To wit, yellow, yolkie things, and then those things do follow, which are of a more transparent yellowness like the Oyl of Rape-seeds, and which are believed to be gaulie, by reason of their bitterness: and at length, now and then, things Skie-coloured and green, which by taking of the more cruel purging Medicines, do happen straightway after the beginning.

13 Here the *Pylorus* was opened between the first, and following vomits, so that whatsoever doth lay hid in the empty or fasting gut, and in neighbouring places, the *Pylorus* may pull upwards unto himself, whereby he may wash off as it were the mark imprinted by the Medicine: But those things are for the most part bitter, both because they have again and again undergone the ferment of the Gaul, and that an exorbitant and angry one; then also because they are besides their Custom, snatched up into anothers Harvest, where they are corrupted into an excrement, made notable by the quality of the ferment which it hath immediately drawn: therefore the Chyle in the same place becomes gawly and bitter.

But in this place I do behold the Schools with admiration, that they should prescribe meats 14
of an easier digestion to be sent into the stomach; before those which are of a harder cocture;
being unmindful of their own Doctrine, which sheweth, that all Contents of the stomach are
turned into a single or simple Chyle; but the *Pylorus* to be so shut from the beginning, that
it suffers nothing, even so much as a drop, to slide forth before digestion be finished. Next,
that coction is made by the un-cessant heat of the stomach, and so for this cause also, the di-
gestion continued from the beginning, to begin, neither ever to keep holiday, as long as its
Vulcan heat doth remain: But that all particular things contained, do receive that digestive
heat after the manner of the receiver: which Doctrine indeed standing, seeing all things are
reduced into a liquid Chyle, and are thorowly mingled exquisitely in the one onely pot of the
stomach; it followes, that in feeding, those things are first to be sent in which are of a har-
der digestion, because they are cooked by so much the longer space of heat.

Suppings (say the Schools) and things of a more ready coction, if they are taken last, would 15
putrifie, if they expect the ultimate bound of the more hard assumed things: As if the dige-
stive faculty were the parent of putrefaction! neither that there should be made a co-mix-
ing of things eaten! or a conversion into a fluid Chyle! but that those things which are ta-
ken by morsels, should lay secret by Soils or Grounds: As if I say, the *Pylorus* should open
it self by set periods or turns, that the order may be kept in dismissing the Chyle, which
there was in receiving of the meats: which things, if the Schools shall believe to be possible, the
Pylorus at leastwise, should have a greater power of discretion in observing the priorities of
meats, than that the Schools should so sloathfully neglect its office. But the closure of the
Orifice doth not conduce unto digestion, neither doth it govern the appetite: But the *Pylorus*
doth command both; because a sufficient satiety is indeed for the most part present; yet
moreover, we as yet do eat and drink from vice: Therefore the closure of the Orifice is
not from an appetite, as neither from fulness: But weariness, loathings, and aversion from
fleshes, do begin presently after Fevers, and the rise of Diseases of the stomach, and they
have the Orifice shut.

Therefore the Orifice is neither shut from fulness, nor for the necessity of concoction; as 16
neither is it continently or sparingly opened by reason of appetite; to wit, if it be shut with-
out appetite, fulness, and concoction, and doth remain open after fulness in time of coction:
For belchings are uttered in the morning, the stomach being fasting, empty, and desiring; yet
belching doth denounce a closure of the Orifice. In the next place, the Orifice is shut in
those, who being pressed with long hunger, do languish, and who have been infirm through a 17
long continuing abstinence from food; To whom the unstopping of the Orifice is very dif-
ficult, grievous, and painful. If therefore the Orifice be not necessarily shut from hunger,
appetite, fulness, and coction, therefore the closing or opening of the Orifice doth not re-
spect necessities in the coction of the serving faculties; but the Orifice doth especially serve
for this, least to him that layes down; the Chyle should re-gorge into the jawes: whence
first of all it is manifest, that the service of the *Pylorus* is more famous than that of the Orifice.

For truly he is the Ruler of the whole Family-administration of the stomach, even unto the 17
last Circle of the Intestines or greater bowels: wherein, because seeing the operation of the
Gaul is perfected, therefore also the *Gaul* ought to be superstructed and incumbent on the
Pylorus.

Of both which, if there be not a full consent, Fluxes, wringings of the Bowels, Dysenteries, 18
the Hemorrhoids or Piles, and divers miseries of the *Abdomen* or bottom of the belly do arise.

It is also an erroneous thing in *Galen*, and his modern Schools, that we do hunger and thirst 19
onely through the penury of venal blood, and so that as many ounces of venal blood ought to
be filled up, as are unfilled. First of all, if that be perpetual, therefore let the Schools choose,
to wit, either whether they will make the manglings in cutting of a vein, to be vain, or the ap-
petite not to be stirred up from the sucking of the veins, accusing the defect of venal blood:
which thing first of all, is not to be doubted of in time of health: for if there be hunger by
reason of want of venal blood, therefore *Phlebotomy* is badly instituted in the penury of
venal blood: But if that be considered in Diseases; suppose in a Fever, where there is no
appetite, there also shall be no defect of venal blood: But if as many ounces of blood are
supplied, as are consumed, of which Consumption, hunger should be the token: therefore in
a Fever, either there is not a consuming of venal blood, or hunger is not the sense of venal
blood consumed.

But if the venal blood be also wasted in a Fever, *Phlebotomy* shall be in vain. Likewise for 20
every event, after two or three dayes; as much blood shall be now consumed by the Fever
(seeing a Fever doth consume and extenuate more than right health) as a *Plethora* or the
abounding of humours (the one onely betokener of blood-letting) should command to be

emptied out: And by consequence, the positions of hunger being supposed, *Phlebotomy* shall every where be made vain: For the Schools suppose that the blood is dispensed into the lesser veins out of the hollow vein (as if a vein were a dispenser; and there were not a difference between the Vessel it self, and the dispenser; or the power proportionally dispensing) and at length into the small little branches, whereby in the last place, it may be dispersed into the habit of the Body: And therefore onely from the sense of hunger, that the last small
 27 branches of the veins do suck the greater Trunk; but that this doth afterwards suck the veins of the stomach and mesentery, from whence at length that hunger and thirst are felt. Which thing being supposed, first of all, those whose veins do swell, should be pressed with no hunger, or thirst; and then, there should not be a sucking of that sense, unless the greater veins were first emptied: Likewise in the third place, this position doth resist the Doctrine of the
 28 Schools, who teach, that the stomach doth cook onely for it self in the first place; but secondarily, or by accident, for the whole body, as the stomach doth undergo a common self-love: For that being granted, the stomach shall neither cook, nor desire, and hunger for the Body, but onely for it self; therefore neither shall it feel, that it may supply the penury of the veins: But the veins shall primarily thirst and hunger, the stomach onely by accident; neither for it self, but for the veins: For the ignorance of the truth, hath made the Schools every where rash: They have not known I say, that hunger is inspired from the Spleen into the Stomach; to wit, that the Spleen hath known the scope of things to be done, as the chief Bowel for the governing of decoctions; and therefore, it is effectively the chief governour of the appetites, to whom notwithstanding, the *Pylorus*, the ruler, and executer, is an assistant: For the *Pylorus* for all that, hath a free Blas of opening or shutting it self at pleasure, which in time of health is moved by reason of its knowledge of the ends known to the stomach, for which, coction, and appetite are created by the Spleen, as if the *Pylorus* were conscious of the secret ends of the Spleen: But in sickness, the *Pylorus* openeth and shuts it self preposterously, and with an inverted order being as it were stricken with a symptomatical fury. For I being about to buy a Village, I did walk with a notable appetite, then by chance I wrung my foot awry, I slid down, rigour presently came on me, with a loathing, vomiting, and the former appetite to eat, being suppressed; but I straightway reposed my writhed foot, and that, half put out of its place; and at the same instant, my former appetite was restored unto me, and the nauseousness of my stomach was ceased.

21 Indeed my Orifice was open, as well in appetite, as in nauseousness; but I had my *Pylorus* shut in my appetite, and straightway opened in my nauseousness, and again shut in my vomiting: For as I said, vomiting is not made but by the shutting and inverting of the *Pylorus* upwards: but in the hicket or sobbing, there is made an inversion of the stomach it self upwards, which therefore is far different from the inversion of the *Pylorus* beginning to vomit. But that those things were after this manner, is apparent: because seeing my stomach under notable hunger, had not wherewith to vomit, being greedy of meat, the *Pylorus* by his own consent, presently closed himself: who again, even from the distortion or writhing of the ligaments of my foot, being as it were mad with fury, opened himself, and called unto him the filths from the *Duodenum*: For at the time of my vomiting, that the *Pylorus* might expel the conceived ballast, he shut himself, and again had opened himself for a new accumulation or heaping up of filths, unless by the restored small dislocation, the fury of the *Pylorus* had been appeased. Therefore if with the closure of the *Pylorus*, my withdrawn appetite straightway returned, who seeth not that the appetite afforded by the Spleen, is governed by the *Pylorus*? I have said, that the *Pylorus* doth snatch the filths out of the *Duodenum* upwards into the stomach; that he who before being the Porter, was thought to be dedicated onely to detaining and expelling, may think of attracting hurtful things: which things, although they do happen by a common force, whereby all things being once banished, do put on a hostile character, and are thereby presently made worse; yet they are in an inverted order drawn unto the stomach, by a raging Blas of the *Pylorus*. I have likewise herein discerned, that the *Pylorus* is not onely the cause of appetite, nauseousness, and vomiting; but also, to be the one onely causer of the Disease called Cholera of the Dysentery, or Bloody Flux, and Flux; and I have experienced, that oft times, a small Remedy being administred, the furies of the *Pylorus* were appeased, and the aforesaid hurts corrected. Surely it is a thing to be grieved at, that nothing hath hitherto been weighed by the Schools touching these things; and that their whole aid is placed in a Clifter, neither that they have come unto the nest of the evil. They have onely converted themselves unto the thorow passage of the thing produced, like the Dog that bites the stone that is cast at him. For I have seen a young man exceeding well in health, and enjoying a notable appetite, in the morning to have eaten some fresh ripe Mulberries well washed, with bread buttered, and straightway to

to have felt a sweet delight of cooling refreshment in his stomach thereby : And then his appetite being by chance half an hour after sore troubled or destroyed, he fell with the pain of the Colick into a Flux, and he had daily perhaps seventy stools of a Milkie colour: But presently restraining Cordials were administred as well within as without : To wit, the juice of Quinces, with Confection of *Alkermes*, of *Diarrhodon* of *Spodium*, *De hyacintha*, and the like exhilarating things. In the mean time, very many Clusters of Whey steelfied, and the like sweepings were injected, and all in vain : At length also *Opiates* were annexed to other things, and nature laughed at the learned ignorance, and sporting experiments ; but the sick man grieved at the vain remedies : And at length at the utmost danger of Life that was appointed, the Lord healed him.

For I administred two hard yolks of Eggs, tempered with *Rose-Vinegar* : his dejected appetite, and the restoring of his appetite by the yolks taken, do testifie that the Flux arose from the vice of the *Pylorus* : For he perceived a manifest ease, the medicine being as yet detained within his stomach. I remember also that by Horse-hoofs fryed in Butter, and the same being afterwards powdered, the fury of the *Pylorus* hath been oft appeased, that dysenteries and fluxes have stopped, and felt the bounty of healing, that strong smelling remedy being as yet detained within the stomach. But if the hoof be the superfluity of a wanton Colt, it is said *To bring certain destruction on those that have the Dysentery or bloody Flux*. Therefore the *Pylorus* being the Ruler of the closure of Digestion, and appetite in the stomach, it doth also through a long journey of the Intestines, govern as well the contents, as the exorbitances of the neighbour-Veins : for the undigestions of meats, and excrements, their corruptions, and quick passages do testifie, that the indignation of the *Pylorus* only is to be confirmed by remedies.

For so yesterdayes gluttony doth stir up giddinesses of the head, not so much over night, as in the morning, the stomach being void of meats, and those do for the most part cease, the break-fast being taken; Because then the *Pylorus* doth open, and is beset with filth, and afterwards he closed himself at the coming of the break-fast, and doth as it were forget the former discommodity.

A Cock of ours, of two years of age, eats Bran and Oats in the morning, according to his custom : but a little before evening he refuseth to Roost on his accustomed staffs; he layes on the ground, and the morning following is averse to meat : Being giddy-headed, he runs down side-ways, and doth oft-times fall backwards : At length, he shakes or smites his Comb and Fore-head harder on the ground, and dyes before noon : But by Dissection were found some lesser flints, not indeed in the first sack or stomach, but in the more inward and true stomach. But a greater Flint had shut the *Pylorus*, which being lesse than a Flint, had cut of the hope of passage: For neither was there any other cause found of so great giddiness, and unwonted death, but that the *Pylorus* because it was by force and against its will, shut in the place of Coction, it had confected or made a Leaky liquor above the greater Flint : Which surely, could not have come thither out of the Gaul, seeing the Flint had stopp'd up the passage from Gaul its coming within the stomach, out of the Gaul, thorow the *Duodenum* : Therefore that green and leaky liquor was bred in the stomach, through the Vice of the stopped *Pylorus*.

Likewise concerning thirst, I have often observed that those that are thirsty in Fevers, have again vomited up the drink, with a fourfold quantity. Therefore thirst is not of necessity, by reason of the defect of moisture, nor also through the penury of blood, as that for the same cause the same veins may sometimes be the cause of hunger, and sometimes of thirst, and the messengers of a defect of venal blood ; yea now and then of both together, as well of hunger, as of thirst : But the Bowel inspiring a ferment on the stomach, doth stir up hunger and thirst : For in Fevers, the cause of the Fever is an *Alkali* abounding; hence neither doth the thirst cease, although the stomach doth abound with its own drink : for neither doth the drink come unto that *Alkali*. For so salt and peppered things do prepare thirst, no otherwise than as putrified *Alcalies* or *Lixivial* salts do; because they exclude the four Ferment out of the stomach. As salt doth hinder the resolving and transchanging of the food, that is, the entrance of the digestive ferment breathed from the Spleen; So a quantity of the more pure drink, things peppered, hard, and undigestible, are causers of thirst: but not because they are hot and dry things in the middle waters detained in the stomach; but because they do resist the aforesaid Ferment of the Spleen. But four things on the contrary, as they are neer to the Ferment of the Spleen, they do refresh thirst. Therefore thirst in the like cases, is not through defect of nutritive moisture, but by reason of the Ferment of the Spleen being hindred, which at length overcoming (by a longer time of sleep) the aforesaid difficulties, therefore sleep takes away thirst. Also thirst ariseth in Fevers by reason of burnish putrefactions, and coagulated things ; but not because nutritive, and cooling refreshing moisture is desired (as they think)

but a resolver of that which hurts: And so it doth not so much shew and require a nourishment, as a Remedy. And therefore neither doth thirst cease by drink, unless this hath brought a co-resembling mean for the receiving of the Ferment. Seeing therefore the *Pylorus* is the Governour of Coction, and no less the Moderator of thirst, than of appetite, as well meats as drinks shall be also the perceivances of the same Ruler, distinguishing the bounds or ends of digestion.

27 For in the Beginnings of *Tertians*, a plenteous vomiting of a yellow excrement, together with much thirst, doth molest; and those two do concur with the shutting of the mad *Pylorus*; and for this cause he doth instead of a four Cream, frame that yellow or cankered excrement or liquor, which being detained in the stomach of the Cock, caused his death. Moreover I will adde four Histories which will confirm the efficacy of the *Pylorus* in the action of Government.

28 My Wives Brother was by chance ill at ease for the space of eight dayes, at *Mecheline*, from a solemn and gluttonous Feast: But a Physitian of the City offers him a vomitory potion, whereby he vomited twice every day: And so he had written the day before, that he the next day would come from *Mecheline* to *Bruxels* unto us: Therefore being Booted, and now fitted for his journey, the day following before noon, he dyed, after that in the foregoing night he had been ill, and had vomited often as before, somewhat black Liquor, or venal blood there corrupted. But his dead carcase being dissected, shewed no vice, except that in his stomach a blackish Liquor floated on the shut *Pylorus*.

2. A Girle of three yeers old, and noble, takes a vomit to drive away an Ague, of a boasting *Italian* Physitian, being a few Grains of a certain Powder.

Also another Noble young Daughter, not yet exceeding the second yeer of her age, took the same: Both of them indeed straightway after the taking of it, vomited; but both of them had their right eye wrung or wrested aside, and their whole side as it were beset with the Palsie; their arm indeed wholly, but their leg not altogether so: For the elder being wholly given to tattle, yet her tongue sorely annoyed; but the younger, slumber and vomiting now and then interrupting each other, both of them dye. I am called unto both, and I attempted some things in vain: Perhaps indeed because late, and life failing. But both their carcases are opened: And the same stinking Liquor detained in the stomach (the *Pylorus* being exactly shut) the cause of the murder, comes to hand.

3. A Hen, when she would pick grain on the ground, she retorted her neck to one side, and in picking was rowled into a Circle on her left side, and her legs sayling, at the taking of every Barley Corn, or Crum of bread, she slid on her hinder part upon her tail: And that had remained thus perhaps for eight dayes space, before it might be declared to me, I ran unto the unworred Spectacle, I unfeathered her most lean breast, and a certain old woman opened her former or membranous stomach with a Razor. But I found that she had swallowed a small gobbet of rocky Chrystal: but that woman sowed up her stomach again with a thred, and afterwards she survived in perfect health.

4. One of my house-hold servants forming some Vessels about Distillation, with a most sharp fire of pit-Coals, melted a Glasse by sporting: the Fragments and Vessels themselves were dark and white, from green Glasse, and the sweepings of my distillations. But the Fragments of his new Vessels being cast into a corner of the floor, the Hens devoured them, being deceived in the whiteness of glasse: They were well in health: but it happened that the fifteenth day after, the two fatter were killed for the Table: But that there were found in their first Stomack some of the aforesaid Fragments, which were easily conjectured to have stuck in the same place many dayes: But they were diminished (so that when as glasse is not broken, but Point-wise) as well side-ways, as corner-wise: Those Fragments were on every side obtruse or blunted. But I have hence collected to my self things worthy of note.

29 1. That the *Pylorus* being shut, my Brother did alwayes vomit: For truly, also after death, that stinking Liquor was found in his closed stomach, which else had been in the Bowels without any notable damage.

2. That that shutting of the *Pylorus* was furious, otherwise it had opened it self, and had not so hurt.

3. That the motions of the *Pylorus* are of another Re-publick, than all others are: For all contractures do cease with death, those of the *Pylorus* not so.

4. That in the vomitory medicine, its poysonous faculty had stirred up the indignation and contracture of the *Pylorus*: For he was not only contracted or drawn together, but he drew forth or allured a bloody juice out of the veins of the stomach, which was forth-with made black, and stinking.

5. That the same things happened in the two little Girls.

6. That

6. That the indignation of the *Pylorus* doth also produce Palfies.
7. But an *Æruginous* or cankerous Liquor, death.
8. That in the Cock, the only stubborn stoppage, from the Even-tide, caused his giddines-
ses.
9. The Hen which had swallowed the Chrystal, doth more strongly prove this, besides
which, no other thing was found in her fore-stomack.
10. That the detaining of Glasse in the stomach did remain with health, because the *Pylorus*
was not thereby stopped up.
11. That glasse is of easier Digestion than rocky Chrystal.
12. That an *Æruginous*, or black Liquor was made from the indignation and shutting of the
Pylorus, but not from the detaining of a Body, or Glasse besides nature.
13. That Glas was consumed by little and little in the stomach of the Hens.

CH AP. XXX.

A History of Tartar.

1. That a Treatise of the four feigned humors, is to be joyned in this place,
for the integrity of the work. 2. After the rejecting of a quality, being
an elementary distemper, we must then also treat of Tartar, and the three
first things or principles of the Chymists. 3. The Birth and Life of Paracel-
sus. 4. He first brought Tartar into a disease. 5. Strife unhappily fell out
between the Humorists and Paracelsus. 6. They afterwards made use of
Remedies borrowed from our fugitive servants. 7. Humours were long
ago silenced, which I at length have demonstrated in a particular Book,
never to have been in nature. 8. An Epitome or Summary of those things
which Paracelsus hath here and there written concerning Tartar.

IT hath seemed to me a meet thing to premise natural things in order to the matter of
Medicine, because I am he who have alwayes thought the knowledge of the whole of na-
ture to have no respect but unto the health or welfare of man : Therefore have I treated of
the Elements alone, whereby I may drive away the fictions of the Schools, touching the
composition of four Elements in every single body, which hitherto is reckoned to be mixt :
That I might shew I say, that there are no mixtures; nor strifes, nor distempers, or complex-
ions of the same, even as neither that the Catalogue of diseases of the feigned temperatures of
Elementary qualities can stand with truth : That is, that the Schools have not hitherto known
the causes of diseases, all which almost they have ascribed to those qualities. Moreover,
now the same labour remains to me concerning the four feigned and false humours, and the
wandring corruptions of these ; it was to be written & shewn, that such humours were never in
nature; therefore also that they have alike perniciously erred hitherto, as well in the Doctrine,
knowledge, subscription of diseasifying causes, as consequently in wandring Remedies, and
the universal directions and applications of these : And seeing that thing is already perfor-
med by me in a peculiar book printed in the year 1644. at Colonia, by Jodoc Calchove, di-
rected for a fore-runner of this work: and nigh the same year I set forth two other Books, to wit,
concerning the disease of the Stone, and the Plague-grave wherein I have shewn,
that hitherto the causes of those diseases are unknown in the Schools : Therefore it is enough
here to have attested it. Although those books are to be transferred hither for the integrity
or entireness of the work. Therefore the causes and essences of diseases, have even unto this
day stood neglected by the Schools, and they being neglected, therefore the more weak have
been destitute of right Remedies.

Now at length, because *Paracelsus* hath lately dared to remove the general cause of almost
all diseases into *Tartar* : And although *Paracelsus* first, hath rashly made that sufficient; yet he
hath remained uncertain and unconstant, whether he might rather determine the three things
(which by his own Authority he called *The three Principles of all corporall things*) to wit, *Salt*,
Sulphur, and *Mercury*; for the general cause of all diseases, than his own brought-in *Tartar* :
And

And therefore he hath left both of the aforesaid assertions to strive: Nevertheless the more famous Physicians have at this day yielded themselves unto *Tartar*. Wherefore, seeing there is not in either, at this day, the truth of the Causes, and Remedies of Diseases; I have held it worth my labour, and for the good of my neighbour, to brush and sweep away both those errors of *Paracelsus* out of the Schools; That Physicians, who while they do now incline unto the Doctrine of Tartar, all errors being at length removed, they may betake themselves to the true knowledge of diseases and remedies: And that from thence my neighbour (which thing I only have wished) may receive profit. For the knowledge of things according to the Principles by me delivered, is drawn by the definition: But a definition is to be taken from a knowledge of the causes: And therefore in so great darkness on every side, and ignorances of Medicine, I will endeavour to bring those that shall succeed, yea and likewise modern young Beginners, into the true knowledge of diseases and remedies. For I have long since lost my hope of the Seniors, who will refuse to learn, being brought to that pass, as well by reason of sluggishness of assenting to the inventions of *Pagans* already drunk up, and converted into nourishment, and of labouring about Furnaces, as through a bashfulness of learning of me a poor man of little esteem, the last of Philosophers.

3 The father of *Paracelsus* being a Bastard of the master of the *Teutonic* Knights, went for a trivial Physician, rich in a famous Library; who committed his son *Aureolus Philippus Theophrastus* of *Bombast* to *Tritemius* of *Sphanheime*: Whence he being rich in the substance of Secrets, went unto *Spagyrick* or *Alchymistical* works under *Sigismund Fugger*: For he was not there given to *Venus* (indeed a Sow in a place where three wayes met, had gelded him.) Secondly, nor to sloath, nor spent he his life in flattery, being earnestly desirous of knowledge: For he, about the twentieth yeer of his age, searching into the divers Mines of the Minerals of *Germany*, at length came into *Muscovy*, in whose borders he being taken by the *Tartars*, our gelded Physician is brought to the *Cham*: from thence, with the Prince the *Chams* son, he is sent away to *Constantinople*. At length about the 28th yeer of his age, he obtained the Stone that makes Gold, it being given unto him; for which things sake, he took up his Inn in *Basil*, where when he now became famous through many cures of diseases, he obtained the Chair of Medicinal Philosophy, that he might give himself wholly up to *Spagyrickal* labours. Indeed as the stone that makes gold lifted up his mind, and he saw the narrow substance of Physicians, and wandering errors of the same, he had long since aspired unto the chief-dome of healing: Indeed he taught at *Basil* full three yeers space, and expounded a Book concerning *Tartar*, and likewise of degrees, and compositions; surely Both, the work of his own invention, and burdened with many Anxieties. In the mean time, as every ones own pleasure draws him, he indulging drinkings more than was meet, began to despise the Chair; yea and the Latine, whence, he had almost forgotten it, and he supposed that he ought to speak truth only in the *Germane* Tongue. Therefore although he was born with a rare wit, yet he was more happy in the gift of the *Azoth* or *Practick*, than in the searching out of the *Theory*.

4 He I say, first obtruded *Tartar* on us, into the cause almost of all diseases, and accused us, when he perceived that neither in the Schools of the Antients, as neither in his own three first things, he was sufficiently credited: To which Patron, the Schools at this day have subscribed. I also at sometime thought my self wholly gratified as it were with a found Treasure, till the Lord otherwise instructed me.

5 First of all, the pages of *Galen*, and *Paracelsus* have disputed, whether the matters of a Tartarous humour and phlegm were not the same, and onely pure Sunonymal things: But at length, being amazed at coagulations, or neither daring to ascribe so great a Troop of Diseases unto one onely phlegme, the more learned *Galenists* admitted of a tartarous humour, and began to use Remedies which they begged from fugitive Servants.

6 Which things, although they were all poysonous, base, and adulterate, and are at this day as yet more; nevertheless, they have invented a knowledge with pots or Boxes, that they may be daily drawn forth for uses. Likewise *Tartar* rising up, the humours have almost failed among the more refined wits.

7 Therefore the disgrace or reproach of Physicians from the ill success of curing, hath perswaded them to look back unto Chymical Remedies, and the grounds of their own Art being neglected, they began promiscuously to use as well those Chymical Remedies, and most miserable poysons, indifferently, as those which their Dispensatories do describe, as well to abolish heats, as to shave off the phlegms of the stomach; so that the sloath of the Remedies, and speculations of *Galen* being well perceived, the *Galenists* do by degrees decline unto *Tartarous* humours: Therefore what things I have read out of many Books, which *Paracelsus* writeth concerning *Tartarers*, I will contract into a brief tract.

Nature being at first a beautiful Virgin, was defiled by sin; not indeed by her own, neither therefore for a punishment to her self; but seeing she was created for the use of ungrateful man, she was as it were defiled with the fault of her inhabitant, that even by the defect of nature, he might in some sort purge the guilt. It after some sort repented the Creator, that he had commanded nature to obey the disobedient: Therefore he appointed, that the Earth should hence-forward bring forth Thistles and Thorns: under the allegory whereof, the curse and rise of *Tartarers* are designed unto us; To wit, their matter which should exceeding sharply prick us: For the words do shew the progeny of the Earth, by the use whereof they do signifie, that Diseases should at length be incorporated in us: For first of all, the hostile *Tartarers* do trayterously enter with meats and drinks, they pierce into the bottom, are radically co-mingled, and shut up with a hidden Seal: Therefore some of them do even presently separate themselves within, from the pure nourishment; but others do remain together with the nourishment, which being wasted away, the surviving *Tartarers* are coagulated under the form of a Musilage, Clay or Bole, next, of Sand, or a Stone, which then, are not onely uncapable of receiving the breath of life; but moreover, they keeping their wild Thorn, have become as the most inward immediate causes of all Diseases, the daily Nurses of the calamity of mortals: For as soon as the blood is converted into the substance of the thing nourished, and afterwards consumed, this off-spring of Thorns doth often remain, surely inconvenient through a foreign coagulation, if not also through acrimonies or sharpnesses: For it waxeth more hard daily, and bespotteth its own Inn with a 1000 Hostilities: But a *Tartarer* or tartarous humour, differs from the humane excrements of meats in that, because these do putrifie, but that is coagulated: Therefore that stomach, and Liver is onely happy, which have known how to banish the sweepings of *Tartar* from the stinking excrements, in the beginning. As these Thorns are procured unto us by our antient Tartarous enemy; So the Stone that adhereth to the Joynts or Ribs of the Wine-Hogs-heads, giving by reason of its manifest Prerogative, a name to the other Ranks of coagulable vices, is called *Tartar*: For truly the Wine in the Vessel is on every side incrufted with a Stony bark, which is *Tartar*, diverse from the Lees: For this falls down to the bottom, knowing no coagulation; but that being extended round about, doth arm the Vessel, and preserve it within, for ever from corruption: But that guest being through nourishments, a stranger, is called a foreign *Tartar*, to distinguish it from that which groweth together within us, with a fatall Spectacle, by a Microscopical Law: For whereby any violent thing doth rush into us, for that very cause the nourishable humours being destitute of life do appear hostile, are coagulated, and called the *Tartar* of the venal blood: whence are Apostemes, stoppages, and other Calamities, according to the delighted property, and pleasure of every *Tartarer*: And so *Tartar* insinuating it self from the mouth, even into the ultimate Coasts of the Pipes; is also the principal cause of all Diseases. These are the things which I could collect out of *Paracelsus* here and there, into one, concerning *Tartar*.

CHAP. XXX.

A History of Tartar of Wine.

1. A fishing for the Whale. 2. The Spirit of Wine is depressed unto the Center of the Vessel, by reason of cold. 3. How Vinegar differs from Wine. 4. Why the Wine in the Superficies of the Vessel, is lesse good. 5. The manner of making Tartar in Hogs-heads. 6. Why it affixeth it self on the Vessels. 7. It is coagulated in affixing or cleaving on them. 8. The things foregoing are proved. 9. The error of a Chymical Maxim. 10. The History of Wine coagulated in Tartar, is not a like to that of the excrements coagulated in us. 11. The difference of Tartar, and Duelech or the Stone in man. 12. Tartar is not wholly, or truly the superfluity of Wine. 13. The first error of Paracelsus. 14. The Tartar of Wine doth wholly differ from a coagulated superfluity in Diseases. 15. Another rashness of the same man. 16. Why Tartar is not incrusted upon the Lees of the bottom. 17. Wines are distinguished by their Tartar. 18. Tartar is neither Wine, nor the Lee thereof. 19. Why an Alkali or lixivial Salt out of Wine, or Tartar, doth dissolve Tartar. 20. The Wine-Lee, as to a part of it, is matter for Tartar. 21. How badly Tartar doth square to our coagulations. 22. Tartar is among coagulated Salts, not among Stones, as neither among excrements.

BEfore I shall reject the necessity which Paracelsus hath feigned to himself for the constitution of Tartar in every nourishment, for the finding out of the Causes of Diseases, and that the vanity of that fiction may be made manifest, it shall above all things be profitable, to expound the manner how Tartar is bred in Wine: for truly (even as it is begun to be believed) all causes of Diseases do stablish their Family, and draw their name from thence. The Cantabrians, whom they call *Biscans*, before they were associated to our Dutch, for the catching of the Whale, being oft-times under *Groynland* (which is at this day thought to have failed) being prevented by cold under the Quick-sands (they call them *Atalaian*) had their boyled Wines, otherwise generous enough, frozen.

1 Therefore the hoops being taken from the Hogs-heads, they exposed the naked Ice of the Wine, in the form of the former Vessel, unto the open Air: That by one onely night following, the remainder might be wholly congealed.

2 Which being done, they did beat the Ice, and about the Center of the Ice, a Liquor of the Colour of an *Amethyst* came to hand, the meer Spirit of the Wine, and a fiery and vital Liquor, not knowing how to be frozen: Therefore they drank the Ice of the Wine melted by the fire, a small quantity of that vital Liquor being added unto it. The History is brought for that end, whereby it may be manifest, that the Spirit in Wine doth naturally flee from cold, and that it doth by degrees, betake it self out of its proper Habitation, unto the Center of the Wine. But on the contrary, Wines are laid in the Sun, that they may wax sour, and the Spirit of the Wine flies away, and leaveth behind it Vinegar, the Sunned dead Carcase of it self.

3 But seeing it is a far more desirable thing for the Spirit to go into the Center of the Wine, than to vanish by flying away; therefore necessity hath caused cold and deep Cellars to be invented for the preservation of Wines. Indeed the *Austrian* Wines working continually, as it were through the heat of the ferment, are clammy: For from hence the Cellars of *Vienna* are for the most part no lesse than a hundred steps deep. The *Spanish* Wines would undergo the same thing, unless a Caution be administred by admixing a Parget of Lime, while they are pressed in the Press, which they call *Hieso*. Therefore in cold Cellars, the Spirit of Wine by reason of cold, runs back unto the inner part of the Wine, and hides it self.

Therefore

Therefore Wine, because cold doth strike the Vessel in the Bark round about, hath lesse Spirit than in its more inward parts: whence it followes, that as through want of the Spirit of the Wine, Wines set in the Sun do wax four; so also proportionally, that the most outward Bark of the Wine being pierced in cold, is more four than in its Central parts.

Therefore when new Wines are brought into the Store-house, and while they have waxed cold, their Spirit doth straightway flee inward, avoyding the cold; and therefore the Bark of the Wine, being now made small, and also somewhat four, it begins to act upon the Lee as yet swimming on the troubled Wine: For truly it is impossible that there should be any sourness, but that its proportionated object being found, it should not also pretently operate on that. Indeed this is the Law and necessity of natural things: For example, Vinegar, how weak soever it be, if it finde the Stone of Crabs, it cannot contain it self, that it should not straightway operate unto its dissolution, and exchange it into a transparent Liquor.

Therefore the four matter in the Wine being now filled with a small dreg, and now stripped of its own activity, inclineth it self to coagulate: But it cannot be coagulated in the middle waters, but it hath need of a fermenting odour of the side, whereby it doth as it were putrifie: Therefore coagulation is made on the sides of the Vessel, to which it fastneth it self. According to the common Chymical Maxim; Every Spirit dissolving, by the same action whereby it dissolveth Bodies, is it self coagulated. Therefore the more sharp Wine dissolveth the Lee in its Bark, because a sharp Salt of the four dissolving Spirit is presently coagulated together with the dissolved Lee or Dreg, and applyeth it self to be neighbour to the side or Concave of the Vessel: And that, least both (to wit, the thing dissolving, and thing dissolved) be hindered from coagulating; but at least, that it be not on the other side encompassed by Liquor: Therefore Tartar the new off-spring of coagulation, is affixed.

Understand thou also, that before it be coagulated, there is not yet a coagulation, and therefore that somewhat four Wine, the Lee being now dissolved by it, in an instant, before it is coagulated, snatcheth hold on the Vessel, and doth affix, and glew it self on there, by the proper Solder of its Cream: Else it should settle to the bottom.

This very thing is the Tartar of Wine, of which we are speaking. That these things are on this wise, Vinegar it self proveth; For Wine set in the Sun, and the Vessel being heated by the Sun, the Vinegar never hath Tartar in the Vessel; yet it is the same matter, differing onely in cold, or heat: There indeed with Tartar, but here without it.

First of all, a remarkable thing plainly appeareth from what hath been before deduced, that the aforesaid Maxim of Chymistry erreth in that, because it will have the dissolution of a Body to be made together with the coagulation of the Spirit, by the same action in number: For if divers moments of motions should not intercede, the coagulated thing it self should not adhere toughly glewed to the Hogthead, as if by that which is melted, it should be there powdered on it; but if it should be coagulated in the very motion of dissolution, it should fall down to the bottom in the shape of a coagulated matter; but should not adhere to the sides.

But on the other hand, in the Region of the Lee, Tartar is not found. Let there be another remarkable thing, and of greater moment; that the Tartar of Wine is altogether impertinently taken according to the likeness of coagulated things in us: wherefore the name, History, manner, and end of Tartar of Wine hath been impertinently introduced into the Causes which make Diseases: And these things shall be made manifest, when as I shall make the devise of Tartar in Meats and Drinks plainly to appear. Likewise as to that which belongs to Tartar of Wine; for that is not a strange forreigner to Wine, produced by a foreign Mother, matter, against, or besides the nature of Wines, as neither to expiate the wickednesses committed by Wine, by those things which are adjoynd for a curse. And then, neither is the Tartar of Wine ever coagulated by a Cream proper unto it (although Paracelsus hath otherwise so supposed) but the Tartar is coagulated after that the dissolutive sourness of the Wine is worn out and glutted by the Lee.

That is, the sourness being overcome by the dissolved content, doth think of making a coagulation: not indeed to make a true Stone; but a feigned one, because it is that which is again dissolved in hot water, as it were a sharp Salt in Liquor, which is therefore commonly called *Cremor Tartari*, or the Cream of Tartar. All which things surely do badly square or suit with our coagulations: yet they all have by a like identity or sameliness of Tartar, in all particular nourishments, been intruded by a winy devise.

- 12 Lastly, and that a violent one: Because *Tartar* is not an excrement of *Wine*, unless in respect of one part, which is a solved Dreg, which thing surely was not also hid from *Paracelsus*, who now and then doth extol the *Tartar* of *Wine* far above the *Wine*, as it were an heir of greater virtues.
- 13 Wherefore he doth badly accommodate or fit the *Tartar* of *Wine* by the identity of Being, and framing, with disease *Tartarous*, which he calls an excrement, yea a curse arising from the Thistles and Thorns, or an ill-endowed entertained Being in a pure Saphirical Being of things: Therefore the *Tartar* of *Wine*, although there should be any other, being erected into the matter of Diseases, in taking the *Tartars* of Diseases, they should even according to the minde of *Paracelsus*, badly agree together: And so he hath also but impertinently referred the cause of Diseases unto *Tartar*.
- 14 Seeing they do not any way agree in the matter, efficient, manner, cause of coagulations, in the bound of a Cream, in their object, as neither in their principles: For the Sand or Stone are not resolved by elixing or seething, even as otherwise the *Tartar* of *Wine* is.
- 15 Therefore the whole metaphorical transumption of name and property is frivolous, and a bold rashness of asserting, by bespattering all created things with a curse, so as wholly throughout they should be nothing but of *Tartar*: and the boldness hath proceeded so far, that they feign *Tartar* to be even in the Marrows, yet not coagulable, which neither hath *Paracelsus* ever seen; but hath asserted onely by a boldness: Now he maketh *Tartar* not to be *Tartar*, nor coagulable: And so that not onely every coagulable thing, and that which hath solidness; but that every liquory thing, that is, the whole Creature should be nothing but *Tartar*, appointed for a punishment of sin. Now when new *Wine* hath waxed cold, hath lost its sweetness, and hath assumed the qualities of *Wine*; the whole Lee hath fallen to the bottom; and then the transmutation of the more four part of the *Wine*, beginneth to act on the Lee: For truly that which is more fruitful than the Spirit of *Wine* desiring by degrees the more inward parts, doth forsake the Superficies of the Hogs-head; but this beginning thereby to wax sour, nor finding an object nigh to it self, on which it may act, but onely in the bottom, it by degrees dissolves that object in the same place; And thus indeed, the sharpness thereof is by degrees the more confirmed: But seeing every four thing doth as it were boyl up in corroding, hence it comes to passe, that when the sourness which is about the bottom hath acted upon the dreg, it ariseth from thence, and is substituted or affixed in another place.
- 16 Therefore the generation of *Tartar* is slow; And therefore cannot the *Tartar* be affixed in the bottom, by reason of the disquietness of that continual boyling up: wherefore generous *Wines*, nor *Wines* easily forsaken by their fleeing Spirit, do not readily wax sour, and they do yield, none, or but a little *Tartar*.
- 17 But old *Rhenish Wines*, do become weak indeed in the acceptableness of a winie tast, as their sourness was drunk up in the Lee, yet are they stomacical, because that their Spirits are not wasted according to the proportion of the dregs, and sharpness: But red *French Wines*, unless they shall keep their Lee, and the which, they therefore say is the Mother or Nurse, they dissolve their own Tincture, and drink it up together with their own sourness; and therefore those of two years old become discoloured, unless they are exceeding generous: For truly the tincture of *Wines* is a certain separable Body: But generous red *Wines*, because they do more slowly wax sour or sharp, they are kept for many years: But those bearing a little white, unless they are severed from the Lee, they presently grow weak: For the Lee being taken away, when their sourish part doth not finde an object which it may dissolve, the *Wine* remains in its own former State. Therefore *Tartar* is no longer *Wine* or Lee, but a neither thing, constituted of them both. But that the thing is on this wise, it plainly appeareth, because more *Tartar* is dissolved in ten ounces of Rain-water, than in two hundred ounces of *Wine*, however it be stirred by boyling: To wit, by reason of the sharpness of the *Wine*, whereby the *Tartar* was coagulated.
- 19 Lastly, six ounces of Salt of *Tartar* do dissolve seven ounces of crude *Tartar*, because the *Lixivium* or lye of that Salt doth drink up the sharpness of the *Tartar*.
- 20 But that *Tartar* doth consist of the Lee of *Wine*, and not of *Wine* onely, *Printers* do prove, who do prepare the Lee of *Wine* or *Tartar*, to be a suitable Ink for them: And both of these in distilling do helch forth altogether the like Odour, and the like Oyl: But *Tartar* is not dissolved in cold water, because the Lee of the *Wine* doth so compass the Salt in the *Tartar*, that cold water cannot the more fully dissolve it, by piercing.
- 21 Therefore seeing the Nativity of *Tartar* doth not elsewhere consist than in winy juyces actually consisting of Spirit of *Wine*, and lightly waxing soure by reason of the flight of the Spirit

Spirit inward : Let the Schools of *Paracelsus* from hence know, how badly the Speculation of Tartar doth suit even with those Diseases, for whose sake it was invented.

For truly our Stone is by no means solved in boyling waters : because Tartar is rather to be reckoned among the number of Salts, or juyces coagulated with Salt, than among Stones.

CHAP. XXXI.

The rash invention of *Tartar* in Diseases.

1. No Disease doth arise from Tartar.
2. Galen is unsavoury about the matter of the Disease of the Stone.
3. Galen was often deceived herein.
4. He thought the Stone to be hardened in us by the Element of fire, in the middle of the Urine.
5. Some ignorances of the same man.
6. A neutral Judge is called for.
7. The drowsiness of the Humorists, unexcusable.
8. An explaining of the thing granted.
9. Paracelsus came nearer unto the nature of Stones.
10. But he also slid in stumbling.
11. Paracelsus recanteth.
12. His rashness brake forth from the ambition of a Monarchy.
13. Blockishness is the Companion of ambition.
14. The nodding unconstancie of Paracelsus.
15. He was deceived by the Metaphor of a Microcosme or little World.
16. His hidden boasting.
17. The like boldness of Aristotle.
18. That the Metaphor of a Microcosme differs from the truth.
19. Paracelsus hath not sufficiently trusted to his invention of Tartar.
20. Two ignorances of the same man are demonstrated.
21. The Rise of hereditary Diseases.
22. The Schools have erred in both extremes.
23. The Philosophy of Paracelsus concerning Tartar, is rustical or rude.
24. His error is proved.
25. The incongruities of Paracelsus.
26. Paracelsus was ignorant of a formal transmutation of things.
27. He blockishly proceeds.

SEEING that Tartar hath first entred into Medicine for the consideration of the Stone, I have finished a Treatise touching the Disease of the Stone, and I have shewen in print, that Tartar is a stranger unto the nature of the Disease of the Stone. Now at length, I will make manifest, that plainly no Disease doth arise from Tartar, but that the meditation thereof in Diseases, is vain.

Galen had known a man to be grieved with Stones and Sands in his Reins and Bladder; but he knew not to what cause he might ascribe so great a hardness in us: at length I found, that not any thing can be condensed or co-thickned, except one onely excrement, which I call muck or snivel; but he names it Phlegm or a waterishness: And when he discerned the Stone to grow in the remote, and so in the ultimate Coasts of utterance, and did think that nothing had access thither besides his own humours; he boldly affirmed that the same thing doth happen in the Urine, and therefore that the Stone cannot otherwise be constituted than from a watery Phlegm.

Which thing, because he marked with the Element of water, and watery properties, therefore that it ought to grow together at the water-pipes in us: The Invention smiled on him, especially because a Stone being brought into the Bladder, there was a continual voyding of muck, together with Urine.

Therefore he thought that our fire, because he believed it to be one of the four Elements which do concur unto the constitution of us, was necessary for the hardening of the matter of the Stone, and that the Phlegm should dry up even in the middle of the waters, seeing he knew no other operators in nature besides heat and cold.

5 For he knew not, that all things did at sometime arise out of nothing: now at length, that from a necessitated continuation in nature, all things afterwards should flow forth from a certain Genealogy of Seeds; but not that from a casual conflux of Elements, and by the virtue of supervening heat and cold, they are so fitly adorned with vital powers: Neither considered he, that those first qualities at the most and utmost, could not generate, or contribute any thing unto a new Being; but onely occasionally to promote or fore-flow the vital dispositions of seeds, in their own simplicity, but not as the Elements should be combined. Surely it grieveth me for his pains, and that all posterity of sick folks doth hitherto pay the punishment of its own credulity; because he never deservedly measured, or of himself once desired the Causes of the Disease of the Stone (as otherwise he ought) before he erected a method of healing: So his Soul is made the Chamber-maid of his own desires, and he feigneth plausible reasons to himself, according to the appetite of disturbance, which removed it from its place to a content of himself.

6 Therefore a strange Judge is called unto the Reasons found out by us, least being credulous, we worship our own fictions, and love them as it were Sons, and pledge for the same against equity, as Parents.

7 Therefore let the fire, the sieve of Reasons, be that Judge: But the art of the fire was not yet known in *Galen's* time, but it was hidden among privy Counsellors under an Oath, in the silence of *Pythagoras*.

8 For *Galen* never saw even the distillation of Roses: Therefore in so great a want of knowledge, his ambition unto the chiefdome of healing might happily be excusable, if he had once at least boyled the snivel coming out of the nostrils, or out of a stony Bladder, in Urine, under a luke-warmth most like to ours, or had by it self dried it without Urine: For he had undoubredly found that Phlegm which he supposed to be hardened in us unto the consistence of a Stone, never, or any where by any degree of heat wholly to become a Stone, no snivel or muscilage ever to be hardened (unless otherwise great with Child with the Seed of a Stone:) but to be constrained into a light and brickle *Tophus* or Sand-stone, or to be again resolved like Glew: For so it had behooved the Monarch of Medicine to have proceeded, and not to have exposed himself as a laughing-stock in time, among his coequals of posterity, and of a wiped nose, because he being content with so wan a devise concerning Diseases, had filled huge volumes concerning the griefs of the sick, their life, and healing.

9 Indeed I do not deny, but that any Muscilage doth now and then become a Stone; but I constantly deny, that that comes to passe, in as much as it is slimy or snivelly; but onely if it be great with young of a stony or Rockie seed: For the more brickle stones do not consist of a pure and transparent Liquor, but of a Clayie and Muscilaginous one: wherefore the whole muckie and phlegmatick Doctrine of *Galen*, hath been dried up in a seminared or seedied Stone, hath remained barren in the Schools without an Ear, and fruit, and hath there grown sick under the Chair, and as brickle, being even now presently scattered into powder, shall vanish away. Indeed the following Ages being more prone to believe than diligently to search, have followed the flock of their Predecessors, going not in the way wherein they were to go, but wherein it had been gone; and through the ignorances of their Ancestors, under the conduct of sloath, the easie Schools do hitherto subscribe to so great ignorance.

10 Wherefore *Paracelsus* aspiring to the new Monarchy of *Elias* the Artist to come, not resting in the luke-warm and drowsie Dreams of snorters, seeking more firm principles of Stones, finally admiring amongst his diligent searches, the *Tartar* of *Wine*, he conceived and nourished great hope in his minde, thinking every Stone, as well in the great Universe, as in the little World, to be meer *Tartar*.

11 And then, through a rashness of boldness, his Progress began to affirm, that every Body doth extract its own solidiry with the same coagulation of *Tartar*, that those which he had said before to come upon things, from the curse, now he may recant, that they were from the beginning, by the appointment of the seeds.

12 He afterwards withdrawing this his own intent of *Tartar*, and that ingenious enough, plentifully collected, that even as *Tartar* was a Stone of *Wine* (a Metaphorical Stone I say, because resolveable in waters) So that the Stone in man should be hardened out of meats and drinks, by a co-like curdling: For so he supposing that he had the sure Beginnings of the Stone, believed that he held the Hare by the eares: His boldness pleased him, and being thereby raised with a hope of Monarchy, he began to commend in many Volumes and glosses, or compendious expositions, almost all Diseases unto his *Tartar*, so that he believed the Plague also to arise from *Tartar*. Moreover, so great was the consequent of this prosperous and

and easie invention, that he thereby promised himself the Monarchship in healing.

But when he had sufficiently well weighed, that the Elements, Complexions, and humours failed, nor that they were sufficient for Diseases, and so the true cause of a Disease not yet to have been made known in the Schools, and the which he did promise to himself to have unfolded together with Tartar; at length, that he might establish the causes of Diseases, he affirmed that all solid things were either meer Tartar, or that they did contain, for a great part of them, the same for our destruction: As if the vast Goodness in the Object of Creation, being solicitous of a Disease, had likewise gaped greedily after our Diseases. The labour of *Paracelsus*, and his emulation of finding out the cause of a Disease, are to be gratified by us; who knowing the vain trifles, and shameful sleaths of the Schools, wholly contended for the publick good: And I shall believe, if he had been more negligent of ambition, that through the most bountifull Grace of God, he had come unto the true fundamentals of healing: But as ambition is swelling, and alwayes hanging on others wills or Judgements, therefore God doth alwayes suffers ambition to float into uncertainty.

Therefore *Paracelsus* being unconstant, could never satisfie himself by the invention of Tartar, wherefore he runs sometimes unto Complexions, and then to the Stars, but then to his three first things, and calls upon the Elements themselves; that he might confirm the causes of Diseases: For sometimes he accuseth Chrystal in the fourth degree of heat, as the off-spring of the fire; but then, as being the Daughter of water, he saith, it is hardened by the greatest cold: And then, he affirmeth that a great heap of Glasse burnt up by a continual fire, and diminished into pieces, doth passe over into a Beryl; having forgotten his Tartar, and being addicted to the first Complexions of qualities through Elementary Degrees, he affirms the Beryl to be the off-spring of Heaven, and of a deeper fire: Being unmindful that he had seen in his own *Helvetian* Rocks, Ice to lay knit together by great cold, perhaps for a thousand yeers, yet not to be Chrystal, but to remain Ice as from the beginning: Therefore he was not yet at quiet in full rest, to have tied up the eyes and credulity of his followers in Tartarers, and to have framed to himself a glorious name; as being confident, he fleeth unto another the last Anchor of his hope; To wit, he translated the Metaphor of a *Microcosme* into the truth it self; Willing, that we should expresse every way and fully, the whole Universe exactly or as to the square, and in very deed, to contain it in all the differences of Earths, Mountains, Fountains, Stones, Mines, Plants, Fishes, Birds, four-footed Beasts, creeping things, also of the Stars, with all the properties, motions, Tempests, Diseases, Defects, and interchangeable courses of the same: Asserting, that unless we do fully and fundamentally know and believe this thing knowingly, quick-sightedly, distinctly, most certainly, most profoundly, and most properly, in every created thing, we are unfit for to exercise Philosophy, to practise Medicine, or to dispute against their suppositions: And moreover he saith, that this undoubted particle, and oprick Science is easier to be learned by ten fold, than unwholesome Latine: By which Elogie or commendation, he is thought amongst his own, to have shined exceedingly in the knowledge of these things, who by a late testimony of the World, hath onely vanquished incurable Diseases.

So also *Aristotle* aspiring unto the sameliness of name of [the Philosopher] despised the contradictees of his own, and indeed false beginnings; no otherwise than as *Necromancers* do require to be credited without demonstration.

Let eternal prayse and glory be to my Lord in all Benediction, who hath formed us not after the Image of the most impure VVorld; but after the figure of his own divine Image, therefore hath he adopted us for the Sons of Election, and co-heirs of his glory through grace: Surely the condition of that similitude were to be grieved at, and too much to be pitied, which had hitherto subjected us under the Law of all calamities, from our Creation even till now, and that before sin we should onely be the engravement of so abjected a thing: as if the VVorld had been framed for it self, but not for us as the ultimate end; but we for the VVorld, whose Images indeed onely we should be: to wit, we ought to be made stony, that we may represent Stones and Rocks: And so we should all of right, be altogether stony, leprous, &c. For indeed, seeing we are by Creation, that which we are, and a Stone should be made in us, that we may represent Rocks; Now death and a Disease were in us before that we departed out of the right way or fell: Let Heresies depart: For neither do we all suffer the falling evill, neither do they who labour with it, have it; that sometimes we may represent Thunder, or the Earth-quake, or an unknown Lorinde of the Air its unconstancy: But now, if there were at least, the least truth hereof, verily he who suffers damages according to Justice, ought also to perceive the profits of the *Microcosme*, even so that, especially we ought to fly; Seeing it is more rational, for us sooner to shew our selves Birds, than great Stones, or storms of the Air, or water. Therefore let allegorical and moral senses depart

part out of nature. Nature throughly handles Beings as they do in very deed and act, subsist in a substantial entity, and do flow forth from the root of a seed, even unto the conclusion of the Tragedy: neither doth it admit of any other interpretation, than by being made, and being in essence, from ordained causes.

- 19 I observe also, that *Paracelsus*, Tartar being invented, and introduced into Diseases, hath not yet stood secure enough: for truly, he immingles Tartar also in the first Beginnings of our constitution, and soneither doth he require the Seeds of things themselves out of Tartar; but he will have Tartar to be radically, intimately, and most thorowly immingled with the Seeds, whereby he may finde out the Seminary of Hereditary Diseases:
- 20 Of which mixture he being at length forgetful, calleth it ridiculous. He saith that a Woman having conceived by the Seed of man, it doth separate, snatch, lay up Tartar into it self, and that the Seed being as it were anatomized, doth constitute it self the flattering Heir of that Tartar: On the contrary, that the Spirit of *Wine* is never so refined by possible circulations, as that it doth not as yet contain its own Tartar in it: As if Tartar were the chief Root of the Universe, or an immediate Companion thereunto: But I know, if any forreign thing be materially in the Seed, generation doth never follow: Next, that the Seed of *Adam* being materially prepared in *Paradise*, had not generated a more perfect off-spring, than that which afterwards after the fall was made in him, *Cain* and *Abel* do especially prove that thing. At length, if Tartar should so intimately grow in Seeds, that after many years from generation, it should cause hereditary Diseases by materially separating it self from the whole; surely that Tartar should not so soon be separable by the Magnet or attraction of a Woman, seeing, if any thing be separated from the seed, it is a Gas, diametrically opposite unto Tartar: For if the womb should separate any thing from the seed, that should happen by drawing: but such is the condition of drawing things, that they draw for themselves and unto themselves, and then cease: but if the womb shall extract for separation sake, there shall now be no fear of an hereditary evill, because the womb hath a power of serving that which is hurtfull. Lastly, although Diseases shall come by degrees into the place of exercise, yet they were never materially thorowly mixed with the Seed, after the manner of Tartar; that not
- 21 Tartar, nor a gowty Chalk fore-existed in the Seed, but that Diseases derived from the Parents, do lay hid in manner of a Character, in the middle life of the *Archeus*, whose Seal doth at length under its own maturity of dayes, break forth, and frameth a Body fit for it self, and so is made the *Archeus* of a Disease, together with every requisite property of the Seeds: For a Disease also, is a natural constitution proceeding from the Seed, consisting of an *Archeus* as the efficient cause.
- 22 It hath otherwise rustically been thought in the Schools, that Disease Bodies do materially conflux unto the Generation of hereditary defects. It also contains an Idiotism, to exclude a Disease out of the number of natural Agents, and corporal Beings, seeing the matter also (which they say is diseasifying) is now and then obvious to the finger, if it be thorowly viewed by the eyes. If therefore a Disease be now reckoned among the Beings of Nature, why should it not be established by a necessity of its own seed? It is rude Philosophy, that
- 23 Tartar had been from the beginning in the seed, and that after thirty whole years, it should begin the first principles of a Cream, and should meditate of an Increase, and as it were a particular Republicque for it self, and that wholly without the direction of the seed. God made not death, nor therefore hath he connexed Tartar unto seeds, as the matter of Diseases: For if so stupid errors should happen unto the seminal *Archeus*, the Ruler of Nature hath already forsaken the Rains of the same, and mankind shall shortly go to ruine. Also that saying of *Paracelsus* is absurd, that not so much as the Spirit of *Wine* doth want its own Tartar: For although it should be circulated for the space of an Age, yet it shall never in very deed separate any Tartar.
- 24 For *Paracelsus*, who never saw or found that Tartar of the Spirit of *Wine*, will therefore be credited in his own good belief, no otherwise than as elsewhere, where he thinketh, that water, as oft as it hath ceased to be seen, doth wholly depart into nothing, and that something is created anew: For it doth not follow, a Salt is made out of the Spirit of wine, it receives a coagulation in the Salt of Tartar, therefore the Spirit of wine doth contain Tartar: Because although every coagulated thing, should be Tartar (which it is not) yet those Bodies do not contain those things which at length are made of them: To wit, Milk is made of Grasse, of Milk Arterial Bloud, and from hence the seed of man; yet Grasse doth not contain a man in it self, as neither doth Grasse contain Cowes Milk. Therefore he bewraies his own Idiotisme, because he will have every coagulable Body of what sort soever, to be Tartar: That is, whole Nature to be Tartar, for the introducing of the cause of Diseases also out of the most refined Liquors: For even as if he had been to have said, that the matter of a Disease

ease is taken from created Bodies; but what then had he made himself besides ridiculous? doth he not the same thing now? while he tieth up every Body, as well that which is coagulated, as that ever coagulable, under Tartar, to finde out the cause of a Disease? For what new thing doth he bring which before was not known, besides the name of Tartar? Hath not *Galen* known, that the material cause of Diseases is coagulated, or coagulable? Therefore by the name of Tartar, he hath at least dazled the eyes; Seeing coagulable Bodies do not assume a hardness elsewhere than from the appointment of their own feed; but not after the manner wherein wine and Lee do strain themselves together in acting. First of all, these things do resist the holy Scriptures, and his very own position, which teach, that Diseases have come into man from sin, and the position, that Tartar was sprinkled on the Virgin Nature: And by consequence, that before transgression, Bodies had their Creams in them, and not from Tartar: For he had found in the History of Nature, if not an Idiot, that no Liquor doth undergoe a coagulation by virtue of Tartar, but from the intention of the Creator thinning forth in the seeds: And therefore whatsoever is condensed, is a new Generation; but not the ripening of a fore-existing Tartar: For else there had been Tartar not onely in meats before sin; but whole nature had been nothing but a Disease, and the cause of death a punishment before an offence, and death had arisen from the Creator.

For *Paracelsus* elsewhere thorowly weighing, that favours do remain in the thing trans- 26
changed, wandering as yet farther off, thought, that Essences do not die, that they are not corrupted, lastly, that they are not transchanged; but that they remain safe in the dungs of living Creatures; and he perswaded himself, that where no, or perhaps the slender footsteps of favours did remain, that their ancient Essences also remained safe; being badly instructed by the Schools, that the same accident did not wander from subject into subject: And so if he had been pressed, he had denied also the transmutations of things: For he would have fruitful fields dunged, because that the Essences of Vegetables being safe in the mud, as knowing no death, should sub-enter into the Roots of things sowed: Being no more mindful of his own Doctrine, wherein the dung of living Creatures is deprived of every property of the composed Body, and is onely the last matter of Salts: But elsewhere he will have the dung to contain the most especial matter of the Tartar, and that in this respect, the undunged fields of *Bohemia* do yield lesse tartarous fruits than those which were fattened with a stony, or earthy juyce or food, or at length with the dung of living Creatures, wherein indeed abroad in the Air in a long race of years this earthy Sumen or fattening juyce doth voluntarily melt: Because this Sumen-soil should produce a Tartar in Herbs, more wild and Rockie than dung so often re-cocted and refined into the matter of Salts: In which respect, some filths do wash out of Towels like Soap.

And *Paracelsus* hath grown to that insolency with his Tartar, that as oft as any thing did 27
gnaw the Bladder, or bring on the Strangury or pissing by drops, he presently nameth that thing, a Chalk or Lime, a frosty Tartar, or any such like thing: As if Lime, and Tartar were now Synonymalls! as though any thing could be calcined in the middle of the Urine, without burning! as if Lime did not presuppose the matter whereof the Stones consist! Seeing there is not ashes which was not before a Coal. Finally, he acknowledgeth also the Tartar of Marrow, not to be coagulable: But how knew he this Tartar, which he could never see? For he will have himself believed in all things, who knew most perfectly the Beings, and all the properties of the Microcosme: But why doth he now call Tartar a Being not coagulable? but that all Diseases, will they, nill they, may obey his fiction of Tartars? For I being a Christian, could not admit of Microcosmical Dreams; as they have been delivered by *Paracelsus*: That is, by literally, and not metaphorically understanding them, which sense or meaning, doth alwayes banish it self from the History of natural things: Neither do I suffer his Tartatars: but according to the same *Paracelsus* I will say, we must believe no man [in that] which he cannot prove by the fire: And therefore I may not consent that Lime is burnt in us, as neither that Tartar is bred in us, because Tartar is not to be acknowledged but in Winy Liquors: but that the matter of Tartar doth remain from Generation to Generation, through the Shops of the digestions, I reject it as a Fable.

Nourishments are guiltless or innocent of Tartar.

1. Physicians at this day do by little and little accustom themselves to the Doctrine of Tartar.
2. An Argument against Tartar.
3. The Tartar of a Disease should not be a Creature.
4. The Thistles and Thorns not to signifie Tartar.
5. Two womb Sisters in nature.
6. By what means the transmutations of solid things may be.
7. An unbelieving invention.
8. An impossibility, some impertinences.
9. The unconstancy of Paracelsus.
10. A frivolous thing.
11. Absurd Consequences upon the Position of Tartar.
12. The Archæus prepares matter for himself, while he doth not finde the same.
13. The Error of Paracelsus about the Idea of the Microcosme in Bread, about Anatomies declared in meats, and Medicines.
14. Other absurdities.
15. Some notable things against the Tartar of meat.
16. Manly Age is lesse subject to Worms.
17. A stone growing to a Tooth, hath deceived Paracelsus.
18. Hence another fiction hath sprung.
19. The aforesaid assertion, and some absurdities are discovered.
20. Some absurdities concerning the Stone of a Tooth.
21. A frivolous thing of Paracelsus.

25. Teeth have their Age.
26. Why Cold is an enemy to a Tooth.
27. An Errour about the hardness of Stones in us.
28. Why the Stone of the Reins doth at length arise pale.
29. The unconstancy of Paracelsus.
30. The neglect of the same man.
31. An instance brought on a Maxim.

THE more refined Physicians do so by degrees go back from the Humorists the Schools, that with Paracelsus, they now ascribe almost all Diseases unto the one thing, Tartar: wherefore it hath behoved me to decypher the beginnings of my repentance, and how far youthful and inconsiderate credulity hath in times past seduced me. In the mean time, seeing the counsel of judgement doth spring forth from the understanding, through the Grace of God, with a free choyce of the assenting will, I will not compel any one. Every one may uncompelledly choose, as much as the free gifts received of the truth, shall shew themselves in the understanding. I likewise being also greedy of the truth of Nature, although a dull searcher, began to meditate, if there be any Tartar in us, with a property of subsisting; to wit, all or every digestion being neglected and finished in us by the retentive faculty, of re-assuming a Cream against our will; that shall be either miraculous or supernatural, or plainly natural, or deceitful, or divelish; which although it be not above Nature, yet by reason of its unaccustomed order in Nature, it is sequestred into a peculiar rank: But whatsoever doth subsist onely by art, seeing essential Forms are secluded from the power of Artificers, the artificial Being thence arising, doth not fall under a Medicinal Consideration: Therefore from a sufficient numbring up of parts, the aforesaid division of Tartar is commended. Again, although Tartar were disease, and thus far besides the intent of humane Nature, yet it should not be in its own entity besides nature; seeing every material Being is enclosed in the bosom of Nature: therefore whether Tartar be supernatural, or meerly natural, at least it should be a Creature: therefore Tartar should be created from the beginning, seeing none is read to be created forthwith after sin, neither any matter to be formally transchanged by the curse: Therefore the Creator had made the punishment before the fault, and death in the matter: which resisteth the truth, and Text.

After what manner soever therefore Tartar be taken, it was not created by God; And therefore it is not any wise created.

Indeed the seeds of Thistles and Thorns were promised to the first Husbandmen, not that thenceforth through the curse, a new Creature in all nourishments should be transchanged or immingled into or with Tartar, which it had not been before the fall: for the curse had gone before the sin, and the punishment had been brought in before the guilt: For Paracelsus ought to have known that there are in nature two Sisters of the same womb or Mother, among tangible things; To wit, resolving, and coagulating; which do mutually receive each other by course.

For

For a Liquor waxeth solid, and solid things do likewise melt: Because that successive change is a Law written in the Stamp of Bodies.

For truly a solid Body is never transchanged into another Body, but it is first reduced by resolving into its first matter, which is the Liquor, to wit, which it had before it was coagulated: neither must we believe that there is any Body at this day, whose matter was not created from the beginning: neither was there after the first six dayes, any void thing in the Body, which by a new Creation of Tartar following after sin, was supplied: And much lesse, that God had created Tartar in us for Thistles and Thorns, which our first Parent and capital transgressor, had not much more principally, originally, and capitally felt, and by consequence, likewise all Diseases, which *Paracelsus* deviseth to arise from thence; Seeing God is not an excepter of persons; but a just and severe revenger for every one their deserts.

Lastly, very many things do hinder me to believe, that any Tartar doth traiterously enter into us, and that although it be rightly subdued and transchanged by our digestion, yet that being afterwards mindful of its malignity, it severeth it self from the company of the good nourishment, doth retain its ancient inclination of hurting, and its ancient Hostilities of coagulating: For indeed, although *Adam* had not sinned, yet Wine had not therefore been without Tartar, Milk without Cheese, Rivers without Stones, and Meats without excrements. Surely, the emanctories of dungs were before sin, neither appointed, that onely after the fall they should serve for their uses. Surely the Tartar of Wine it self, hath deluded this first inventor of Tartars, being ignorant, that that Tartar had proceeded from its Creation, as a profitable and good Creature, having proper ends according to the intention of God; By how much the more, that the inventor of the Tartar of a Disease doth confess Tartar to be more excellent than Wine; but excrements are not more excellent than the Bodies whose superfluities they are: At leastwise, it is not reasonable, that a Being should possess a great virtue, which it had drowned in Nature, from the curse of sin: But if a Body in as much as it is coagulable, is Tartar; now the whole Universe shall not be free from this guilt, but it is the Son of cursing, and not of Creation. In the next place, Tartar of Wine is resolved by the boyling of water, and the water being evaporated, it again groweth together into a Powder, which is now called a Cream: But it being once subdued by our digestion, it is no more afterwards coagulated into a Powder: For even as there is need of boyling water to dissolve; so there is need of the digestive faculty to transchange.

Therefore he should be a Physician of wicked Counsel, who should give Tartar to drink, if it might again be coagulated within, and should traiterously adhere to the Vessels: For if after absolute digestion, any thing should retain its ancient force of coagulating, and thereby should bring forth some Centuries of Diseases, that thing by all prerogative, should be the very Tartar of Wine it self, under whose Banner, the others have given their names in the power of *Paracelsus*: But besides, the Tartar of Wine is not any more coagulated into its ancient state, but it layes aside all hope of hardening, so that it cleanseth the stomach of muckinesses or filths: therefore much lesse could the Tartars of meats do that.

Furthermore, if any Tartar having entred out of the Earth, into meats, should again retake the drawn Counsels of a Cream in us, surely that Tartar first undergoing in Herbs and lesser Cartel, and so in meats themselves, the same Lawes of transmutation, it being banished and separated from the same, had either been like Tartar, or otherwise, it had lost in them the wild nature of coagulating: But seeing it shall not exercise in meats that treason of hardening, neither shall it retain, or hath it the properties of Tartar: after what sort I pray, shall it resume that in us, which at first when it was made an Herb, or afterwards, when the flesh of Cartel? For how shall it forget its treachery, in its first transmutation into an Herb, and afterwards in its second, into a Beast, and should at first repeat it in us by its third transmutation, with Pot-herbs, with Milk? But if it had been formally transchanged, and had lost the essence and property of Tartar, while it did put on the vital Spirit, and substance of a Cabbage, Grassie, Milk, and flesh, and was truly made vital in these, the brutishness of Tartar being laid aside, how I say, and whence shall it finde in us its ancient and unchanged principles of coagulating a disease Tartar? or if it shall not lay aside the properties of Tartar, while it was made an Herb, while Chyle, Cream, Bloud, and at length Milk, why doth it not shew it self an open enemy? For neither doth Philosophy permit, that it should be both a Tartar, and also a Cabbage, or at length, living arterial bloud, and Tartar also.

Wherefore, if Tartar hath lost its own essence, and departed into a strange one, it could not have retained its own, and much lesse, rather have passed in us from a privation unto a habit, than in Herbs, than in Bruits: At length, if there be real Tartar in things, surely that should be persevering through all the transmutations of a Body, nor suffering any thing by the

the powers of sublunary things, which should suffer nothing at all by so many transmutations succeeding each other, unless being taken by us alone: But this is absurd, to endow any thing with the excrements of perpetuity, which should not be familiar to their pure Being: yea, either a field that is dunged (Rape roots springing a fourth time therein) should bring forth fruits laden with no Tartar at all; or it is absurd, that at the third or fourth turn, Tartar should even manifest itself, before it be hidden. Moreover, if every growing or increasing thing should have a proper and unseparable Tartar in it, that in us onely, but not in the Milk and Blood of bruit Beasts, Tartar by an appointment should be made; it should needs be, that Tartar began from the beginning of the Creation, and not from the reproof of sin: But if Tartar should not be in other Creatures, but onely in us, now its original should be supernatural, and no Disease should be natural; but every Disease should arise from a Miracle; and our digestion should be viler, and life shorter than that of the vilest little Beast, whereof to wit, there is a digestion unto a true transmutation, and in respect of them, all Tartars of meats do remain miraculously changed in its first matter: This I say, Philosophy destroyes, which teacheth, that a transmutation is never made without the death and deceale of the former Being, and the destruction of the terme, from whence, to wit, least one onely thing should consist to be in two terms or bounds at once: For that the juyce of an Herb may be made venal blood, the essence of the arterial blood of the Herb must needs first perish, with the properties of its own *Archens*, and for this cause also all Tartar to perish in every transmutation of things. VVhat if Stones in Cherries, Peachies, Medlers, Peares, &c. be the created Tartars of those fruits, surely they ought rather to have been brought on the Stage of Tartars, and into the causes of diseases, than the very Tartar of Wine it self, which is resolved in boyling water: Also the Medicinal Schools should be wicked and pernicious, who do give the shells of those Fruits to drink to their sick folks in manner of a Powder, in as much as whatsoever should melt through our digestions, should contain Tartar, and therefore should necessarily increase our Stones. And moreover, Tartar being granted for the cause of Diseases, of necessity a Kernel had before sin, been in a Cherry, without a shell, and so every created thing after sin, had been forthwith changed, even unto the Sciences and Idea's of Seeds, and had put off its former disposition and figure, and should presently increase from the curse, and not from the virtue of the blessing, *Increase and multiply*. Therefore are the shells of those Fruits vainly adorned with so great a grace, are sealed by providence, and do keep every where a specifical sameliness, if they are the off-springs and Reliques of excrements or Tartars, if they are not the appointed works of Seeds; but the accidental structures of Tartar. So also thorow the stalk of a Cherry (surely a small thred) a Liquor should passe, the future Tartar of so great a hardening, which had never grown together in the stalk or body of its Cherry, but onely about the Kernel: And moreover, the appointment of Nature is rather and more prime about the skin, and shell of the Cherry, than about its Winy juyce: And so nature should intend an excrement, before the thing it self: But in us, onely by the co-touching of the teeth, Tartar should straightway wax hard: Also Tartar should exceed in a notable knowledge, because it being taken, doth not yet wander thorow the Plant, nor also while it being chewed by a bruit Beast, is it wasted or grinded; but being in the possession of man alone, should be formed into Tartar, but elsewhere it will not, or knowes not how to be coagulated. Truly if in Fruits, Tartar doth not follow its own appointments; but first, onely in man; I can scarce believe, that this Command was enjoined it by God, while it enters into us in manner of meat: But rather, if any thing of meats doth degenerate within, from the banishment of that which was accustomed in nature, let that be our vice, nor the vice of things great with child of Tartar: But if Tartar should lay hid in things, the errour should be in the *Archens*, from the ignorance of the Lawes of his own nature.

- 12 Let that be an absurdity, to wit, to deny that through digestion, the thing digested and transchanged from the former visage and inclination of its seed, can be changed into the nature of the digester: For indeed by one onely and homogeneal juyce, four hundred herbs, and as many diverse trees are sumptuously nourished; not indeed that from that similar juyce that is separated for wood, which containeth more of Rozin, and a stronger cream, and as many separations of the same juyce of the earth are made, as there are diversities in the aforesaid plants: far be it: That is unworthy of the *Archens*, who hath fully known the office of his own life, and hath obtained means for the perfecting those things which are to be done by himself in the matter subjected to him: For not any thing is seperated from the seeds for a roor, stalk, leaf, flesh, bone, or brain: The diversity of members is not drawn from the truth of a simple liquor, for the *Archens* wanteth not a little, and unperceivable diversity thereof in seeds, on whose power every interchangeable course doth depend, and of which

which fore-existing disposition, indeed the *Archeus* himself is the principal and one onely workman, to wit, from the same *Vulcan* the diversities of things do issue forth, no lesse than the properties of diversities; for else the *Archeus* should not be a transchanger, but onely a ripener and cook. For was not wood a juice in its beginning? and so a meer herby liquor waxed hard by a feminal virtue, but not by a fore-existing hardnesse in the matter.

That also of *Paracelsus* is absurd; that although material dispositions, the causes of heterogeneous members, do not actually exist, at least wise there is a spiritual humane Idea in the bread, without which the food should not be turned into nourishment: and this Idea or Image he calls an uttered Anatomy, and he boasts that it is visible by art: I think that in the same bread there might be thus together, the Idea of a Sparrow, a Carp, a Swine, an Oxe, a Dog, an Horse, an Ape, &c, which Idea's should pierce the humane one, in the same morsel of bread, so that *Paracelsus* did not shew always an humane Idea, but now and then he offered a swiny one; unless a spiritual separater were present, who might remove the other Idea's as oft as he will, from the humane one, to wit, who makes himself appear visible in an humane Idea to whom he will. Away for shame, with serious trifles in healing.

Furthermore, a Bean being set or sowed, the bean presently comes forth to light, neither hath it lost its heterogeneous parts to be propagated into a root, stalk, branch, and leaves: But a thing separated being granted, which should be made in the seeds of things, according to the varieties of parts to be constituted; therefore how much more curiously hath the *Archeus* watched over *Tartars* to be separated from the meat or food? Nevertheless, if any *Tartar* be granted in the food, surely that is never sent into the veins, but when it shall be converted into a true Chyle, that is, after that it shall cease to be *Tartar*: And therefore coagulation being taken away, it is no more a Tartarous matter, otherwise the whole Universe should be nothing but Tartar.

For a certain young man loosing with us from *Cales*, sailed eighteen whole dayes, even unto *Bilbo*, and he did eat daily, not lesse than as much as he had eaten in six dayes on land; but he went once aside on the ninth day, and again on the eighteenth day to unload his belly, but his excrement scarce exceeded the bignesse of two eggs: Whence I infer, that so great an heap of foods was changed and consumed into juice, straightway to be blown away in nourishing. If therefore his meats did contain Tartar, and that young man should not expel this by excrement, he had of necessity been sick; seeing indeed Tartar is not digested or turned into good arterial blood; but according to the lawes of Tartar, it being snatched into the veins, ought to have been coagulated; yet he lived in health above four years after: Therefore the Tartarous trifles do fall to the ground.

Again, a man being made not a little lean by a more durable disease, recovered; but he could not abstain from much meat, because he was exceeding hungry; neither yet cast he forth thorow his bowels the sixtieth part of the food taken: so that whatsoever he is wont lately to deject by excrements, did then repair his flesh: For so a more strong stomach doth easily coct even the harder meats without hurt, or remembrance of Tartar, which meats notwithstanding, the *Archeus* separates abroad, as a true excrement, being lately become more loathful than himself; to wit, he sometimes is luxurious within, while with threatnings to himself, he corrupts with a superfluous delight, those things which otherwise are unhurtful unto him, and banisheth whatsoever lesse pleateth him, although it be full of juice: For whatsoever he will not overcome, that he is not intent upon, doth not attempt, but repelleth from him, and condemneth: But as much as he doth not resolve in the shape of a transparent liquor, but leaveth troubled or besmeared with colour; all that he leaveth as unprofitable, to run down in haste: But that which is fully resolved, being fit for himself, he chooseth, retaineth, and suits with a conformity, draws it inwards, and entertains it within his own possession, being then stript of the inclination of every cream, and it borrows that inclination from the *Archeus* of the members that are to be nourished: But so much as the *Archeus* hath once despised, it is either a superfluity in it self, or it presently becomes such, for a repulse; but whatsoever he hath once repelled, that he hopes will never be assumed again afterwards. Therefore it is manifest, that if meats are not changed into good venal blood, that happens through the vice of digestion, but not for the sake of any *Tartar*: for a more slow and delicate digestion doth loath all things, as it were with much huckstery, and reserveth but little to it self from much meat, though full of juyce; but it despiseth the rest, being affrighted through the abundance, no otherwise than as being enraged by its own unaptnesse or drowsinesse: For I remember, that a cock being filled with wheaten bran, expelled the brans whole by excrement, without the floure of the meal; but that he being by and by pressed with hunger, again are up the ejected brans, and in his second dung, that all the bran returned into a liquid excrement.

16 Whence I have learned, that if any thing among the excrements doth appear lesse bruised, or changed; that is not from the vice of *Tartar*, but from the errour of the digestive faculty: VVherefore also I have conjectured, that manly age is lesse subject to wormes, than old age, or childhood is: For one onely bread in this is almost wholly reduced into blood, which in the other departs into an excrement. Likewise, the venal blood is made a bone, flesh, liver, gristle, &c. And it undergoes various hardenings, not for the sake of *Tartar*, but of the transchangeative virtue of the *Archeus*.

17 Therefore finally, we are constrained or cannot admit of any *Tartar* in meats; for that hath deceived *Paracelsus*, because he saw a yellowish stone to grow to the teeth, which although it neither had its like elsewhere in the body, nor abroad in the world, yet because it after some sort answered to the Stone in the bladder, in hardnesse, he rashly affirmed this stone of the teeth to be the Tartar of meats: moreover, to be the harder, by how much the neerer it should be to the meats, and mouth.

18 Lastly, he thinking that nothing of a meaty *Tartar* did belong to the bladder, said, that the stones of the reins and bladder are onely the *Tartars* of drinks, not of meats: and to be fitly of that property, that it was the harder, by how much the farther it proceeded or went from the mouth. Surely an elegant devise, which he also imposed so much the harder on it, by how much the longer he persevered in it. For he plainly shewed therein, that he neither knew the original and matter of Tartar, nor of Stones in the kidneys or bladder, yea, nor of the stone of the teeth: And therefore he also hath rashly brought *Tartar* for to be the Father of any Diseases, which things surely are here more largely to be explained.

19 First of all therefore, I will suppose ale or beer of the best and wholesomest water, (to wit, rain-water, and refined from all suspicion of *Tartar*) and heavy, to be made strong, and to be drunk by one inclined into the disease of the Stone; verily notwithstanding, this man shall not therefore be free from the Stone, because his drink hath nothing but a meaty matter, but not the *Tartar* of drinks. VVherefore if *Paracelsus* hath not dictated Fables, that Ale or Beer could never supply matter for a Stone: yea, the *Tartar* (which he feigneth) in corn-grain, should lose its meatie property of coagulating it self afar off, and should assume the property of the Tartar of drink, by the onely coction of it self: and by consequence, that the same thing should happen unto bread baked with fire, as also to other meats; and the aforesaid rule of *Paracelsus* should be onely for raw meats: So that he which eats onely boiled things, should not be apt for a Stone of the tooth: As if he who drinks pure distilled water, should not be subject to the Stone! which thing *Paracelsus* himself denieth concerning *Frederick*, the Emperour, abhorring *Tartar*: and he will also have drinkers to be subject to *Tartarers*, by pure water, and boyled, because water once boyled, easily putrieth: therefore putrefaction, in respect whereof *Tartars* do decay, shall now be made the Mother of *Tartar*, which one onely thing otherwise, is wont to be the enemy of coagulated things: As if indeed decoctions, or the broths of fleshes, should either not be subject to putrifying! or unwholesome, as being boyled! or that *Tartar* in waters not boyled, were instead of a *Balsam*: why therefore doth *Paracelsus* prescribe preservatives to be chewed with every food, least the drink wax *Tartary*, if this hath lost its *Tartar* by boyling? or if water shall suffer nothing by boyling, why doth he say that it is unwholesom, soon putrifiable, and the cause of a stinking breath? But if Urine be made of Drink, through a sufficient mixture of meats; how therefore will it make the Stones of the reins and bladder out of the Tartar of drinks alone, and not likewise out of a promiscuous meaty Tartar? Doth he perhaps intend to say, that none doth pisse solid meats? But that is a folly, if it be spoken in earnest: But if he will have that to be a property to drink, that it makes Tartar so much the harder, by how much the farther it shall be brought down; yet then likewise he shall badly distinguish the Tartar of drinks against the Tartars of meats, seeing (if there were any) the Tartar of the meat should be as alike well immingled, as the Tartars bred in drinks: For what journey or delay should drink give to Tartar? or what shall this obtain for its hardning by running down? for truly the Stone is not coagulated by heat, course, or digestion, (as shall be made manifest in its own place) but from the seminal root of its own internal coagulation. Therefore it must needs be, that Tartar should lesse exactly inhere in meats, than in drink.

First of all, Ale or Beer contradicteth this, which although it consist of a water not *Tartarous*, yet it begets Stones, and the stone of the teeth, no lesse than simple water.

Secondly, waters do contradict, which in falling, do at any obvious thing presently wax stony, and so much the less, by how much the farther they shall decline from their Spring-head. VVherefore, seeing at the time of digestion, separations of superfluities do happen, which digestion doth want a flowing water; Surely the drink should under the first narrow examination of digestion, put off every stone, and that which is most exceeding hard and sincere, and

and the Tartar should hang too loosely in meats, which by chewing onely as soon as may be, should fasten it self to the teeth, and should separate it self from the meats wherein it had lurked before through so many circles of years, and metamorphoses of forms, in plants, beasts, milk, &c.

But I pray, what separating faculty is there in the teeth, which through a naked, mill-like bruising of the meats, should not onely draw the Tartar out of meats in healthy persons, but also may be for the severing of the grosse from the fine, and the hard from that which is less soundly durable? But if this do not happen by the severing and election of the Tartarous parts, then the whole meat should be of the same condition, and whatsoever is of the meats, all that should be suitably Tartarous: Thus far therefore God made death, and all things whatsoever he saw were not good. If all meats are Tartars and excrements, why likewise do not earthen pots of the Kirchin affix to the Tartar of the teeth, unto the thicknesse of some fingers? and while it is stinking and smelling after the manner of the teeth? For how shall the Tartar of meats being separated from the meats by biting, be able to be affixed in biting, if the teeth do cleanse and moisten themselves by biting? yea, that Tartar should equally grow to all the teeth without exception, because all things do equally concur, to wit, the teeth, meat, and chewing. But many have their teeth free from being invaded by that stone; for besides the Ethiopians, whose gums do end into a sharp point upon their tooth, these especially do not easily fasten a stone to their teeth. But on the contrary, whose bloody gums do swell, do end into an obtuse or blunt one, and are badly joyned to the teeth, such a stone is often co-heaped on them. Prince *Radzvil* tells, that he hath observed a thousand jaw-bones of dead Carcasses in Egypt, seasoned now for two thousand years with a mumial balsam: And that he found none whereunto a tooth was wanting, that was rotten; or lastly, black: For such is the goodnesse of the Climate, for the teeth, and their brightnesse, which surely it punisheth another way; because there is scarce a third man in the same place without blear-eynesse, or a notable vice of the eyes.

Lastly, if such should be the property of the teeth, that it should separate such a Tartar from meats; now the teeth of all should be altogether equally beset with stinking Tartar: And likewise if any co-chained order or row of teeth, and that detained with the hand, should be led or held by bruised meats, even the meats with that order should be bruised as it were with a pest, and the row should be so much cleansed by washing, as one onely draught being professedly taken doth since our teeth for us, yet never any stone should grow to those teeth, and much lesse that which should stink like a stone of the teeth, because it is that which makes the breath to stink. And then to him that hath a Fever, who eateth or cheweth nothing for four dayes space; a muscilage is not therefore wanting to his teeth, which at length becomes a stone; yea, he hath it more plentifully than one that is well in health. Therefore it is manifest, after what manner the muscilage becomming a stone first about the roots of the teeth, where they do appear without the gumme, can be the Tartar of meats: and then, that meer drink should readily cause the same hardnesse which he feigneth to be proper to the Tartar of meats. Next, another who eateth nothing, and that drinketh by a cane through the defect of his mouth, palate, tongue, jawes, &c. and therefore cheweth nothing, and so touching not any nourishment with his teeth, yet he daily affixeth a stone to his teeth, no otherwise than he which eateth. Likewise, after every repast, although the mouth and teeth be exactly cleansed by washing, yet in the morning a new stone and stinking muscilage is conversant about the teeth, which at least could not have remained of the meat, and the which, if it should be the Tartar of meats, this should also be as often diverse, as there are interchangeable courses of meats; which the *Carthusians* have, the same, and alike smelling, as the devourers of flesh have. Likewise they who are fed with simple bread, and apples, have it no otherwise than those who do eat bread, and likewise cheese; Even those *Irish*, who live by *Trifol* or three-leaved grasse (which they call *Ciambrock*) instead of bread and water: with the *Norwayes*, who are content with raw and dried fish; all do agree in the same stone, except a few of a more happy disposition.

Therefore it was a frivolous thing to have founded the invention of Tartar for diseases, out of the Tartar of meats, by reason of the tooth-stone, which certainly in the first place doth not issue from a dreamed *Microscopical* property; because the *Macrocosme* shall never in chewing affix a stinking stone to its teeth. If therefore the stone be not from the Tartar of meats, neither surely shall it also be from the Tartar of drinks; because seeing it is that which seldome toucheth at the teeth, it swiftly floweth thorow, and should sooner wash off the same Tartar, than apply it. Therefore I will shew from whence the tooth-stone may have its matter, and efficient cause; Because it will afterwards as yet be certainly manifest, that the reasons of Tartar are vain.

Therefore

22 Therefore it is an undoubted truth, that the tongue is cloathed with a fimbrious or seamy coat like unto whole silk; and if it shall wet any thing of the meat, or drink in the mouth, that this is contained within those seams or hems, until they are filled up with the same moisture: Yet that is not any Tartar of the meats, or drinks, as if it were a coagulable body separated from that which is not coagulable; but it is soundly the whole substance of the meat, which perhaps became wet by the spittle, and is detained within that whole silk. And moreover, that filth being shaved off from the tongue, yet it doth not attain the hardnesse of a tooth-stone, with whatsoever lukewarmth it may at length wax dry: It stinks indeed, yet not altogether, by reason of the cadaverous smell of the stone of the teeth: For if presently after feeding, the tongue be shaved or scraped with a file, or rubbed with a more course towel, in the morning indeed thou shalt again scrape off lesse muscilage, but not therefore lesse strongly smelling. The like thou shalt find concerning the teeth.

Understand thou therefore, that this ballast of the tongue doth spring, not onely from the meats, but also from the spittle and superfluity of the tongue: For if the meat that is detained in the hollow of a tooth, the same excrement whereof is drunk up in the coat of the tongue, hath remained there all night, it breatheth forth a far more stinking vapour, than the aforelaid shaved muscilage of the tongue: So also between the gums and the cheek-bone, how clean soever thou shalt wash thy mouth after supper, every morning a certain white muscilage is co-heaped, which being wiped off from thence by a towel, and dried on it, doth smell with a proper stink: Therefore by an oblique passing thorow the matter, I will give notice, that this muscilage of the tongue is the special cause of the difficulties arising in the jawes; consequently also, those that are subject unto these evils, to have freed themselves by a frequent filing, or scratching, to wit, as after every meal or time of feeding, and in the morning, they do claw their tongue: For truly the tender and neighbour parts abhorring this muscilage, when it putrifieth, do wax wroth through a horrid contagion on themselves; therefore they do kindle a thin inflammation, by reason of the presence of a guest that is a foreigner unto them. But that tooth-stone is not the son of the spittle or meats; seeing neither, nor indeed both of them together, can ever be coagulated into such a hardnesse, and much lesse into a smell so stinking, infecting ten thousand times every day the whole air of a stinking mouth and breath. I have long since admired with my self, that a generation or birth, so frequent, strongly smelling, and manifest, hath remained unknown for so many Ages, and by so many wits of men: Therefore, as being afraid, I sighed; what therefore would the Schools act about more abstruse or hidden things! I will shew what the Mistis of things hath taught me: In the mouth nothing is conversant, besides spittle, meat, and drink: But the tooth-stone is of none of these, but in its first rise is like a white snivelliness, which on the morrow becomes of a pale-yellow colour: thence at length it growes to the teeth into the hardnesse of the Stone of the Bladder, from whose gums it begins to be of a clayish colour, and in the teeth oft-times manifest with black spots, yea, and makes the tooth to be rotten and black: So that the most hard and dry thing of the whole body, that is, the tooth, doth also most speedily putrifie. I have known indeed that the muscilage of meats, and the spittle, did grow together, but never into the consistence of a Stone.

24 For which cause we must note, that the tooth is nourished, not onely in its bottom and root, but also side-ways from the gums themselves; gums themselves that are bloody, or lesse sound, are witnesses, which do not fitly co-here unto the teeth, because they forthwith from the beginning of their indisposition, do leave pits or little trenches at the tooth that is badly nourished, and do tinge the tooth with the blacknesse of their out-hunted venal blood.

Then lastly also, because the tooth is of a most acute feeling under the gum, which our of it, it wanteth: Therefore in so great a liveliness of sense, the tooth lives, and therefore also is nourished. Therefore the excrement of the gums, as it was of prepared venal blood, for the nourishing of the tooth; so also it hath received some kind of limitation, or power, of a tooth-like hardnesse: Which excrement surely of the teeth, when as it hath drunk up the muckinesse of the meats and drink, it straightway also hastens to harden unto its appointed hardnesse.

For that which I have said in my Book of the Disease of the Stone, concerning the stony feed, and so of petrescency or the manner of making in stones; that also not incongruously doth totally agree to the tooth, for the framing of a tooth-like Stone: For it once received the Seal of a Cream, and Seed of a Stone making for the tooth, the which, although it were already made a superfluity, it as yet retained; not indeed, that it might therefore be *Tartar*, but from the determination of the *Archæus*, whereby it had been already appointed for the making of a tooth. But a spear-like gum is there a sign of the most perfect health, or soundnesse, and therefore it scarce createth a tooth-stone: For the gum co-touching with the tooth

tooth, even unto the end of it, doth not admit the tooth to bring forth excrements, but preserveth the tooth: Even as a tooth being bared of gums, doth easily ake, doth putrefie, and affix a Stone: For the eyes do weep forth a Liquor, which in the morning in the eye-lids, looks like Amber, and the which by the *Germans* is for this cause by way of similitude, called [*Augstine*] or *Austine*. But the excrement of the eares, like unto a yellow Oynment, is a great comfort in the pricking of the sinews: therefore it hath not been an unaccustomed thing for the teeth to produce an excrement, and this a strong smelling Carcase resolved out of stinking blood: For the muckiness cast on the tongue from the meats, is dried, neither doth it wax stony, unless it shall be admixt with an excrement which doth unsensibly break forth between the tooth and the gum: For as that is the excrement of the tooth, it had drawn a limitation of hardness from the beginning: And so it being grown to the tooth, it deceives with the shew of a stony crust. I have observed also a tooth to grow even unto the fortieth year, with a true growth: For that which is opposed to the tooth pulled out, through the penury of attrition or grinding, doth exceed its own rank, and enters into the opposite rank, even unto the aforesaid terme: therefore a tooth, after it ceaseth to grow, scarce wanteth nourishment, or but little (because it is a substance scarce capable of distation or blowing away); then therefore the gum is fruitful in more superfluity, snatcheth somewhat more of nourishment, becomes bloody, and being swollen, is presently lessened, and becomes as it were rotten: For from hence is there often tooth-ach, rottenness, hollowness, and putrifying, especially in those whom a little after due season, they do in youth suspend their growth: therefore the teeth, as they do live in a peculiar Family-administration, so also they have their own ages, which I thus remarkably distinguish.

For the tooth which after a mans eighth year doth shew forth the clearness of dark or thick Glasse (which from the colour of Milk, *Artificers* call *Lattimo*) or of a *Snail-shell*, is a young one; It is a white Colour, bright and polished: And then by degrees it waxeth pale: presently afterwards it becomes dully white, as it were Ivory; It is the youth of the Tooth: Then afterwards it becomes obscurely pale, as is seen in those who swoon, & in deceased Virgins; And this is its manly Age: And at length it waxeth palely yellow like a bone, and looseth its former brightness; Then doth the old age of a Tooth begin: For so much as a gristle differs from a membrane; but the Tooth-ach is frequent, while the Gum decreaseth, and the Tooth is of a bony Colour: But last of all, a rotten, hollow, black, wormy and strong smelling Tooth, is the frail or declining age of that Tooth: therefore cold is an enemy to the Teeth.

For it hastens their old Age: the greyness of hairs doth argue the old Age of the same, even besides the old Age of the man, and one hair waxeth grey long before another: So also one Tooth waxeth old before another: whence it is plain, that every Tooth doth live in his own quarter. *Southern* people have brighter Teeth than *Northern*; because they enjoy a more bountiful Air for the Teeth: the Teeth of Children before the seventh year of Age, do easily feel rottenness, because they are driven out of their ditch by another growing up, are deprived of nourishment, and loaded with a Tooth-like excrement: therefore the hurting, or anointing of the Teeth is to be esteemed according to the annoyance of the Gums: to wit, from the plurality, and bruitishness of the excrement: No otherwise than as the Brain being hurt, doth heap up very much muck, and any other part being discommodated, many dregs; so the Teeth and the nourishing parts of these, if they are hurt, do thrust forth not a little of a stony, and stinking superfluity: But because that excrement is not so much the superfluity of meats, as the excrement of man; therefore all Nations have very equally a stinking Tooth-stone, which doth circumvent *Paracelsus*, and hath increased the suspicion of *Tartar* in us.

Hence therefore it is manifest, why of the same Urine, the same stone doth first grow together as bricke, in the Reins; and afterwards in the Bladder is most exceeding hard: not indeed, because there is *Tartar* in the Urine, which by how much the farther it slides down, by so much it is the harder: that is a childish thing: But surely every stonyfiable juyce hath its own determined, and not a foreign hardness, from the virtue of its own seed: For this juyce being oft-times mixt with a matter not becoming a Stone, waxeth greatly hard: Suppose though Rie meal doth not become a Stone; but being at length resolved into dung, it falls in rottenness or a worm: Notwithstanding, if it be joyned to Lime which is conjoyned with its Sand, it affords a stony, and not perishing Morter: So likewise the Bladder at the time of the Stone being its guest, weeping out the muckiness of its own nourishment, doth also co-mingle it with the stonifying juyce of its Urine, affords a hard Stone to the Bladder far different from the Disease of the Stone of the Kidneys.

Wherefore

28 Wherefore the Reins also being vexed with a Stone of long continuance, do no longer produce a reddish and sandy Stone; but a whitish and hard one: to wit, when the Superficies of the substance of the Kidneys being wasted, the fibrous parts, and seedy or spermatical stuffe or threds do supply a white co-like muckiness, from a spermatick alimentary juyce: wherein, it hath no lesse been erred hitherto, than if thou shalt say, that Rie meal is of it self stony, which borrowes that from an adjunct, which it had not from it self: therefore the Muscilage in the Stone, is not phlegme; but a spermatick nourishment separated under the burden, being not of it self stonifyable, but onely by its adjunct: For thus in distinguishing causes by themselves, from causes by accident, sufficient ones from co-assisting ones, primitive causes from transplanted or derived ones, we come down to the knowledge of the thing.

29 For *Paracelsus* doth for the most part ascribe the hardness of Bodies unto feigned *Tartars*, but elsewhere, all hardness to be from Salt or from one of the three things: However, both together cannot stand, seeing one of the three first things doth not subsist as a Beginning, nor without the fire: Also if it should subsist, it should differ from *Tartar*, as it were a principiating material cause from a formal effect. So I have sufficiently and over-proved, that neither of them is true: For it hath hitherto been unknown, that all Bodies are materially of water onely. Indeed *Paracelsus* had seen Metals, and Wood to stonifie, and to be immediately reduced into a Salt; yet he knew not that the hardness of things, as also their solidity, compactedness, and weight, is not from the nature of his thorowly taught principles (because they are those things which are demonstrated to be non-beings in the nature of principiating) as neither from a material virtue elementarily; but onely from the appointment of the Seeds. Therefore I collect two things; one is, that *Paracelsus* is unconstant to himself touching the *Coagulum* or curd of Bodies, and concerning *Tartars*: But the other is, that the Maxim of *Aristotle* falls to the ground; That for which every thing is such, that thing it self is more such: For although hardness do proceed from the Seed, and its appointments, the Seeds ought not therefore to be harder than the things constituted: For the *Archens*, which disposeth the bones to their hardness, is not therefore harder than the bones: yea neither are the means directed to the end, more hard, solid, or compacted than the things constituted: For *Aristotle* being readily inclined unto Maxims, brought over his experiences from artificial things into nature: therefore hath he every where slid in nature, because he being wholly ignorant of nature, doth miserably quarrel.

CHAP. XXXIII.

Tartar is not in drink.

1. Some suppositions proved before.
2. That Tartarers are not in things constituted.
3. Three Monarchies of things, whence a threefold stone.
4. It far differs from the Tartar of Wine.
5. The Stone in man is made from error, but not from the intention of Nature.
6. An Argument from the like, is not of value.
7. Some Arguments taking away Tartar out of drink.
8. An opposite Argument.
9. The rashness or heedlessness of the Schools.
10. Two Histories.
11. The boastings of Paracelsus.
12. The swellings in the neck or Kings-Evill, are not from Tartar.
13. Wine is innocent of humane Tartar.
14. Whether stony or Rockie waters do contain Tartar.
15. Whence there are Strumaes or swellings in mans neck, and not in that of Bruits.
16. A Remedy against those swellings.
17. A Remedy against Scirrus's, and swelling pimples in the face.
18. A preoccupation or prevention.
19. A distinction by a Maxim.

VV Hatsoever Arguments do take away Tartar out of Meats, are like premises in this place: But seeing waters do immediately wax stony, the proposition is to be confirmed by a stronger Engine. In the first place, I have taught, that every Stone is immediately the Son of water, but not of Tartar: And then, that the concretion or growing together of every Body is from the Seed, but not from the Law of Tartar. Thirdly, that the concretion appointed by the Seed, is from the integrity of nature, and so from the gift of Creation; but not from Tartar, which according to Paracelsus, is nothing but the excrement of a thing.

But a natural product is of its Mother matter, but not of a step-mother; and moreover of a seminal or efficient beginning, in which, all the figures, Idea's, and knowledges of things to be done, are. At length, the Types or figures of Tartars are not in things by Creation, framed for our destruction, as neither a Medicine of destruction in the Earth: what therefore doth it make to the introducing of the nature of Tartar into Diseases, that a stone is the fruit of water; if the condition of Tartar be not in a stone? Or that Tartar is the fruit of Wine, if there be no such thing in other things? For what doth it prejudice nature, if the phantasie deluding a Stone external, or the Stone internal with a name, shall call it Tartar? And he weakly enough, and without proof affirmeth, that Stones, and every solid Body do mutually agree with Tartar of Wine in every property? For truly that his own assertion is free, without truth and probability: For the Stone in us is generated by another seed, mean, and progress, than Tartar out of Wine, or a Stone out of water, are: To wit, there are three Monarchies of Bodies in the Universe; the Animal, Vegetable, and Mineral; therefore there is a threefold Stone, and that distinct in the whole Monarchy: For a Mineral Stone differs from the Case of the Kernel of Medlers, Peaches, &c. and both these again from the Stone of Crabs, Bezoar, Snail-shells, Fish-stones, the Stone of Man, &c.

Again, those three Stones do also far differ from the Tartar of Wine, which is not to be reckoned among Stones, seeing it is the concentered Liquor of a Salt: For a Mineral is either a Rockie Stone, which may be turned into Lime; or a small Stone, which is not calcined, as Gems, Marbles, Flints: But both are now concluded in one onely name of Petra or a Rock: But a Vegetable Stone, seeing it is burnable, as the Jeat or Agath, otherwise also, Mineral Sulphurous Stones, it is rather a knotty Wood, than a Rockie Stone: But an Animal Stone is rather a stony bone (because it is partly burnt) than a Rockie Stone. Also for distinction of the stone of man from other stones, that is by Paracelsus called *Duelech*: Because rockie stones, as well the mineral as vegetable ones, are fruits, natural, necessary, and of the first intention in creating: But *Duelech* is onely a Disease, and like to a monster: But in other enlivened Creatures, the stone hath obtained a profitable appointment.

K k

Whence

- 5 Whence it is made manifest, that although waters do beget a Rockie stone; yet that they do not therefore follow the essence, seed, and manner of generation out of the Tartar of Wine: For *Duelech* after sin, doth from a disease excrement, but not from the intention of nature, nor from a Rockie or tartarous matter, but by accident, to wit, through the error of the faculty, breed a disease seed, through the necessity of a connexed agent: wherefore I do not admit of Tartar rather in drink than in meat; but if it be potentially, in Wine, that comes to passe by the necessity of a connexed agent, and by accident, neither can it have place of exercising forces, or actuating in us, to wit, that by a power, a potential Tartar may be actuated in us; and therefore I do not admit of a tartarous generation in drink, appointed by God for our destruction: for what if bones are found in the flesh, and the seeds of a Mineral Rock are stablished in the waters, shall therefore the seed and immediate matter of bones be in Fountains? or the seed of a Mineral Rock, and its immediate matter, be in the flesh, or venal blood? If not in the venal blood, then neither therefore in drink and meat; For death is not the handy-work of God: And God saw that whatsoever things he had made, they were good; as well in his own intention of goodness, as in the essence of the Creature: Therefore there is no matter in the waters, which was created to stir up the Tragedy of Tartar, or a *Duelech* in us. Moreover, if there be any evil now, or that may come to passe among the digestions, surely that is not from the Creation, appointment, property, efficient of matter, and the finall intention of the Creator; but doth issue wholly from our error, and the corruption of nature: Indeed such things do happen through a received importunity of forreign seeds, a defectuous transmutation of nourishable things, or a not sufficient severe expulsion of hurtful things. *Tartar* fore-existing, and being solved in the drink, if it were so, verily it should by its appointment presently wax corrupt in us, before digestions, putrefactions, and resolutions, neither should it expect the counsels of coagulating into the last passage of the Urine: And the same should rather stonifie equally in all: Notwithstanding, seeing the stone doth not grow up in the drink, but onely in the excrements, by the admission of the Salt of the Urine, and the assistance of other co-workers (even as abundantly in my Book of the Disease of the stone) it is presumed, that *Duelech* doth not consist of a fore-existing *Tartar* of the drink; which is made plain by a Handicraft resolving thereof in the fire: For *Duelech* being distilled, the Glasse-vessels also being shut, doth produce a stinking Oyl; lastly, the Spirit, and Chrystals of the salt of the Urine, being such kinde of things as are allured out of mans Urine by distilling: For it is certain, that the stomach, bowels, veins, Liver, and kidneys, do not generate *Duelech* or the stone in man, of their own nature, much lesse do they continue the same, and as yet much lesse of a prepared and fore-existing *Tartar* in drinks: For else all likewise which do generate mans Urine, and in any man without exception, no otherwise than as little stones do grow in Crabs without exception, should procreate *Duelech*: But *Duelech* doth wax stony from a seed, being at length generated in the Urine by a transmutation of a matter: That seed is so prevalent, that although one subject to the stone, drink nothing but distilled water, he should not therefore cease to generate *Duelech*. But they say, red Wines do generate very much sand in those subject to the stone, therefore they do contain a sandy *Tartar*: therefore not onely in those subject to the stone, but in all altogether, they should bewray a Sand; but seeing that thing happens onely in defectuous persons, hence it is made manifest, that the sand is not made by way of matter, but some other way: For truly the stomach of those that are defectuous, should separate the sands before they should come down to the kidneys.

- 9 The ignorance of the Schools hath arisen from hence, that they know not, or do not thoroughly weigh, that many things are made by transmutation, which were no way materially within: For truly, none but a ridiculous man will say, that bones are in grasse: This dispute will cease, when I shall shew that *Duelech* is formed of things far estranged from coagulation: for neither doth it follow; some Wines do contain more of the spirit of Urine, or of a volatile Earth; therefore they contain the stone *Tartar*, or therefore the *Tartar* of Wine doth materially generate the stone of man by its separation of it self. *Ginger* brings forth much sweat, therefore *Ginger* containeth very much sweat materially: For the Schools do give their judgement after a rustical manner concerning the things of Nature, not knowing, that many things are brought to passe by the endeavour of the Efficient of transmutation, I say, by the seed of the thing coagulating, and at the time of the Operator's transchanging: which works are never due to matter, nor to their heats, and feigned combates of the Elements.

For I have seen two that were Twins, educated also by the same Nurse, and meats, the elder 10
whereof was subject to the stone, the younger not so: for the milk did contain no more of *Tar-*
for the one, than for the other. Likewise the Child of a certain Governour or chief Ruler,
being born of two healthy Parents, had three healthy Brothers and Sisters before him; but
being nourished onely three moneths by a Nurse that had the stone, he underwent *Lithotomy*
or cutting for the stone, once at seven years, and then again at ten, and thirdly, two years at-
ter; and the last time, he gave up the Ghost under the knife: these two Histories at least,
happened not from the coming of a forreign *Tartar*.

Seeing therefore there is not matter, existence, truth, knowledge, necessity, or conse- 11
quence in things taken, which may square themselves unto *Tartar*; *Paracelsus* hath to brag-
gingly boasted, that he first found out every cause of Diseases, that he was the chief Monarch
of Secrets and Medicine, and that by this his own invention, he hath accused others of igno-
rance: But moreover also, that he did discern by the *Tartars* of Countries, to what Diseases
the Inhabitants were subject: For if there never were *Tartar* either by creation, or from
the curse, which may be the original of Diseases; surely its a frivolous thing, that he hath
searched into the same by distilling, and hath found that which never was. Indeed he had
seen great stones to be generated in the bottom of waters: Also that in *Siria*, *Sabaudia*,
Valesia, horrible *Strumae*s or swellings in the neck, did with a miserable spectacle, deform
the shape of man: And he being deceived, hence he concluded, that from the *Tartar* of wa-
ters, there were stones, *Strumae*s, and consequently every stopping thing: For he was badly
ignorant, and that for the destruction of his followers; that all things do arise from seminal
Agents, and that it is granted to them to bring over the matters subjected unto them, accord-
ing to the appointments and ends of the seeds: For indeed although some drink be more
hurtful to those that have the stone; yet that is neither *Tartar*, nor doth it from hence con-
tain it, neither is any thing of the form of *Tartar* co-thickned into *Duelech* (as I have taught
in its place) but it is the work of that which operates, whatsoever is in the waters, by an actual
seed, unto a Rockie Stone or Bole.

But if there be any thing in Wine, it shall be as to the Lee, by it self, but as to *Tartar* by 12
accident; but not as to *Duelech*: For thou shalt ask in vain, whether waters in distilling,
are potentially made a Rockie stone: For Rivers and Springs do teach that without labour
and expences: But of Wine, a Rockie stone, or *Tartar* is never made, & much lesse *Duelech*:
neither shall also the plurality of Lees or dregs accuse *Tartar*: as neither the stone: Be-
cause *Duelech* is of another Family than *Tartar*: Hence, by how much the richer vvines are
in *Tartar*, they ought to be so much the more healthful against *Duelech*, if *Tartar*, otherwise,
be given to drink for the cleansing of filths.

I agree indeed, that Rockie waters are of a wild disposition, of a mineral condition, and 13
the causers of undigestions, as they do contain strange or forreign things: But they do not
therefore materially contain *Duelech* in them, although they do occasionally destroy digesti-
on, do imprint a rockie middle life: whence the enfeebled vegetative faculty of man puts
on that wild inclination: But that makes nothing for the Authour of *Tartars*: For truly, it
is a far different thing to be made stony occasionally, from a stonifying virtue of the middle
life of things, imprintingly and sealingly introduced into the *Archem*: and to be made to
have the stone from *Tartar* melted and resolved in waters, which at length in the period of
dayes, may re-assume its former coagulation in the drinker:

For this latter to be in Nature, I deny: but the former I affirm to be among ordinary ef- 14
fects. But as concerning *Strumae*s or *Kings-Evil*-swellings in the Neck, and swelling pimples
in the face, many think that they proceed from mineral waters being drunk; also *Paracelsus*,
from the use of waters of an evil juyce or disposition: But I could with according to the mans
own Doctrine, that he may shew by the fire those evil juyces in waters, whose property it is
to be coagulated onely in our last digestion, nor elsewhere than about the neck or throat-
bone: But I know that he never found in waters such a *Tartar*: Therefore he may be
condemned by his own Law, wherein he gives a caution, that none is to be believed, but so
far as he is able to demonstrate that thing by the fire. I confess indeed that there is in the
water a middle life, whose property it is to stir up the *Archem*, and to infect it in the ex-
changing of good nourishment (but not of a forreign *Tartar* existing in it materially) into a
Rockie hardness: But unto *Strumae*s a matter is required, which by the property of its own
Archem, may be bred to stop up our jawes, and as it were to strangle us, and that without
the tast of astringency, or an earthly sharpness or harshness (for otherwise this tast sticking fast
in the bosom of the matter, being ripened by the first digestion, dieth) and which being trans-
changed into nourishment, and retaining the ancient virtues of the middle life, performs its
power more about the throat, than elsewhere: which power being left to it by an heredi-
tary

tary right, in nourishments, and from hence in the venal blood, doth convert the nearest nourishment of solid Bodies into a Rockie excrement, which goes unto the throat by a strangling faculty of the director. And I narrowly examining that thing in *Germany*, have found Mushromes to be strong in the aforesaid poyson of strangling; and that those do often grow out of the Root of a Fountain the Fir-tree, and Pine-trees, in steep Rocks, toward the North, where black *Agarick*, an Heir of the same crime, is often in the Trunk or Stem. I have learned therefore, that the whole *Leffas* or Plantry juyce of the Earth is there defiled with a Mushromy disposition: Therefore I have believed that hard swellings of the Neck are bred by the use of Herbs and waters, which have drunk in this sort of *Leffas*.

15 Furthermore, that an Archeal power of the middle life in things, doth beget *Strumae*s, but not a reviving ill juyce *Tartar* of the water, the thing it self doth speak: For otherwise, a *Struma* should bewray it self no lesse in the bottom of the Belly and Liver, nor more slowly, than in the throat.

16 For River or ill juicy waters do not respect the throat, nor should promise so great hardness: Nor surely should the hard swelling of the neck or throat dissolve by an astringent and earthy Remedy, whereby I have many times seen very great *Strumae*s or hard swellings of the Neck to have vanished away in one onely month, and the strangling suddenly brought on people by a poysonous Mushrome, to be cured: which Remedy is on this wise. Take of *Sea-Sponge* burnt up into a Coal, 3 ounces; of the bone of the Fish *Sepia* burnt, long Pepper, Ginger, *Pellitory* of Spain, *Gauls*, *Sal gemma*, calcined Egg-shells, of each 1 ounce; mix them with the stilled water of the aforesaid Sponges, and let it be dried up by degrees. Take of this Powder half a dram, with half an ounce of Sugar, the Moon decreasing, that it being melted by degrees, may be swallowed: Or make a *Lincture* or *Lohoch*. It shall also disperse *Botium* or the swelling pimple in the face. Others for want of the Sponge, did take the hairy excrescency growing on wild Rose-Trees, very like to the outward Rhine of the Chestnut, rough, and briery or hairy: the powder of which alone, they did use successfully. Likewise I have used an unctiō in *Strumae*s, and *Schirrus*'s: Of Oyl of Bay (not adulterated by Hogs-grease) 8 ounces, of *Olibanum*, *Mastic*, Gum Arabick, Rosin of the Fir-tree, of each 3 ounces; distil them, then distil them again with Pot-Ashes. If therefore the hard swelling of the Neck, or a hard *Schirrus* elsewhere, should grow together from a foreign *Tartar*, it should rather wax hard by hot Remedies, neither should it be so easily dissolved: Therefore the *Struma* is a defect of the *Archeus* the transchanger, and not through the coagulation of *Tartar*: even as concerning *Duelech* or the stone in man, I have more clearly and abundantly demonstrated: For the *Archeus* transchangeth every masse subjected unto him, unless being overcome by a more powerful middle life, he shall give place: Therefore the *Struma* is of good venal blood, on which, a strangling power of the middle life is felt. And *Botium* or the swelling pimple of the face, a remedy being taken, perisheth, which is not for dissolving a Rockie matter, if it were of *Tartar* brought over thither: otherwise, it is altogether impossible that *Tartar* (if there should be any) should conceive a breathing hole of our life, be made lively, be co-fired to the members, and be admitted inwards unto the last digestion, & conceive a ferment of the Arterial blood, but to be discolled or blown away by an unsensible transpiration; as also *Schirrus*'s bred of vital venal blood, the aforesaid Remedy being administred.

17 But besides, the contention is not about the Asses shadow: for truly it is not all one to have denied *Tartar* to be materially in meats and drinks, and likewise to remain throughout the shops of the digestions, and therefore at length to be coagulated in miserable men; and it is far remote from thence, to admit of a thing in us, to be transchanged out of a good Cream, Chyle, or venal blood; into an evil one, by virtue of the middle life transplanting the directions of the *Archeus*: For as there is one order of generation; so also is there every where another of fore-caution, and healing: Therefore there is no foundation, truth, appearance, or necessity of tartarizing: For which way doth it conduce, to devise *Tartar* to be the stubborn Prince of coagulations, which oweth his Birth to a fiction? For truly the dispositions, coagulations, and resolutions of things do depend on their own Seeds. *Duelech* is made no lesse of the purest meats and drinks, than of those lesse exact, if the middle life do badly season the *Archeus*. And then, which way is it convenient, to render meats and drinks which the Lord hath judged good, infamous through a tartarous treachery? I suppose indeed, that it was invented by Tartar Hell, or the Infernal, when Satan did now conjecture, that there would speedily be a banishment of Humours out of the Schools of Medicine.

18 And indeed, seeing every thing is dissolved by the bursting of the bonds which tie the same, it helpeth to have admonished, that coagulated things are not made in us by drying up (the gowty Chalk excepted); neither by *Tartar* privily existing in us: surely much lesse from

from a stony and limy condition of the Microcosme: For that Chalk after the attained thick-
ness of the Sunovie or degenerated spermatick Muscilage, is afterwards by degrees dried up:
Even as elsewhere concerning the Gout. After another manner, even as any Schirrhus thing,
and likewise a bole, clay, muckiness, sand, and Duelech, are in their beginning coagulated
and resolved by seminal beginnings, and are far otherwise solved and coagulated, than if a
stubborn and unchangeable Tartar of any kind of things, had of its own free accord yielded
a foreign curd in us. It is a Sophistication, to have accused not the cause, for a cause, or to
have neglected the cause, as not the cause, which Sophistry, if it be wont any where to
bring on great straights: surely in healing, as great as may be, full of dangers of life, and
damnation, as also of damages: For one doth well digest, and difficulty separate, but a-
nother doth successfully expell, and troublesomely digest. Lastly, a third doth briefly di-
gest and cause melting; but doth viciously transchange for himself under the command of a
foreign seed. Therefore it is one thing to chastize a forreign impression of the middle life
(which consisteth in the concretion or growing together of the thing digested) & it is another
thing to expel or separate that which else being retained, would hurt. And that is contained
by dissolving and expelling.

Finally, if there should be any Tartar in things taken into the body, ending at length into a
stubborn coagulation, which it had treacherously brought inward with it, it should every
where even contain a desperation of healing: And in this respect a medicine of destruction
in the earth had been framed in nature from the beginning by the Lord of things.

Last of all, Tartar is not in meats, as neither in meaty drinks; but in the water there is
indeed a seed of small stones, but that Stone is no more Tartar, than a rocky stone is bread:
wherefore also from a stonifying Seed, the presence, or power of Tartar can in no wise be
concluded.

Likewise, although in superfluities or degenerated venal blood, there be a power unto a
Duelech or Schirrhus, yet not unto Tartar; and much lesse that there is Tartar naturally as
well in the blood, as in superfluous excrements: For whatsoever is bred by accident from a
foreign and estranged seed, and by a Metaphor, by reason of its coagulation, is likened unto
Salt coagulated in wines, is onely by an abusive alienation called back unto Tartar: For Na-
ture hateth metaphorical and poetical liberties. Therefore Tartar is not the internal occasi-
onal matter of diseases.

19

CHAP.

CHAP. XLIV.

An erring watchman, or a wandering keeper.

1. The Schools nod or doubt concerning the four humours.
2. The Authors repentance.
3. A Position, with proofs.
4. What muck or snivel is, and in what sheath it is generated.
5. Who the keeper in the terms proposed may be.
6. The unexcusable necessities of the keeper, hitherto unknown.
7. It is proved, that snivel is not the excrement of the Brain.
8. The brain is from thence concluded to be most miserable.
9. The vanity of Diseases dedicated to a Catarrhe or Rheume.
10. Snivel is not made of venal blood.
11. An argument from a like suitable thing.
12. From the Pose, or distillation of the head.
13. From the likenesse of the other Bowels.
14. From the supposed doctrine of the Schools.
15. From the identity or samelinese of the Archeus.
16. From Anatomy.
17. From an absurdity.
18. From the necessity of stoppage.
19. From the constitution of the brain.
20. From its scope or aime.
21. From experience.
22. The rashnesse or heedlesnesse of the Schools in a matter of so great moment, and so plain, is taken notice of.
23. That the excrement of the Ears is brought forth by a vapour.
24. A necessity of watchmen or keepers.
25. It is proved by the Pose.
26. By Hoarsnesse.
27. By Coughs.
28. The Keeper is an unheard of power.
29. The Schools thought both powers to be a certain distemper, even in healthy persons.
30. A diversity from other powers is proved.
31. The testimonies of the keepers.
32. A stuffing in the head, or descending Rheume is never healthy.
33. The Cough is examined.
34. A wandring keeper.
35. A dry Cough.
36. The difficulty of curing, from whence it is.
37. The Remedies are taken notice of.
38. The rashnesse of the Schools.
39. Remedies out of Sulphur.
40. A twofold Asthma or difficulty of breathing.
41. The difficulties of healing.
42. The use of the Keeper.
43. The erring Watchman of the wind-pipe is the more destructive one.
44. Snivel differs from a spitting by reaching.
45. That the Keeper differs from the other Faculties in the brain.
46. That the Diaphragma or Midriff is pory.

THe Schools pointing with the finger at the muck or snivel from the Brain, and the spittle of Coughs, have said, *Behold, Phlegm is one of the four constitutive humours of us.* And afterwards they alwayes subscribed to themselves. That boldnesse in wantonizing increased, being confirmed by the prescriptions of so many ages, and subscribed authorities of Schools: As if the brain had consumed the three other supposed and feigned humours for the nourishment of it self, Phlegm onely being excluded, although most like to it self, and otherwise, according to the minde of *Galen*, most fit to be totally transchanged into venal blood. Also sometimes the Doctrines of the four Humours being forgotten, they have sent away the same muck or snivel, no longer as a Phlegm, or a snivelly Phlegm, but as a superfluity of the brain, being as it were a banished enemy, a superfluity resulting from digestion. It hath deservedly shamed them of that their own Doctrine, because they have acknowledged snivel to be an excrement of the last digestion, but not any longer a humour produced in the Liver, as it were one part of four of venal blood: For an excrement resisteth a vital humour. Therefore they do oftentimes nod, and stagger, and doubt again, while they do promiscuously point out a snivelly man, (to wit, from that dung and disease affect) to be Phlegmatick, and after-

afterwards they thereby measure and divine of his strength, wit, manners, and fortunes. In the mean time, the Beginnings of the Schools are unfortunate, which from an excrement known to themselves, do denominate the essence, existence, properties of phlegm, of Elements, and the constitutive humours of us: For the phlegm which about the beginning of a pose, doth rain down out of the Nostrils watery (as they say) and thin, after some dayes is made thicker, and yellow, because it is thickned by a daily cocture of heat: As if perhaps for full forty years, without the corruption of it self, the Scull being empty, it had expected a thickning as its chiefeft good? nor otherwise being more thin, should it finde chinks enough for utterance! These dreams do not deserve reproof by Argument, unless by a serious credulity, they had translated the method of healing into the destruction of mortalls.

I confesse indeed, that at the time of my young beginnings, I believed, that snivel, if it arose not from one of the four Humours, at leastwise, that it was an excrement of the digestion of the brain: But afterwards, through a more liberal diligent search, I declining from the Schools, began to observe, that in Summer I seldom cleanse my Nose, but in Winter very often: Notwithstanding in either station, I through the Grace of God, do enjoy a brain and its fruitfulness or operations, alike strong at both seasons: For I moreover considered, that my Winter venal blood is alike lively with that which I make or digest in Summer: (For the life according to the holy Scriptures is placed in the Arterial blood) and that the digestion as well of my brain, as of my other parts, is alike wholesom, because compleat: which things should not be on such a manner, if the brain should daily draw out at least four ounces of an excrement, and therefore sixteen ounces of venal blood, for the onely nourishment of it self, and the abundance of so great a quantity of phlegm (to wit, besides that which hath remained in the nourished Body for a pledge of nourishment) which ounces, it should otherwise in Summer leave in the venal blood: Or if they do suppose that to be made by a more exact digestion of the brain: or if they had rather to have the brain, by reason of the injury of a Winter Air, to be badly disposed; and which way soever it be taken, the snivel must needs be caused at least from some indisposition: therefore not from the abundance of phlegm, and so from the vice of the Liver, as neither from a more exquisite separation of winter phlegm, and the neglect of Summer phlegm. Neither in the next place doth that indisposition happen through the vice of the brain, as not of the venal blood: For that resisteth the position proposed. Therefore that very thing doth spring from elsewhere: For if those superfluities should remain in the venal blood, or brain, in Summer-time, which are otherwise, expelled in Winter; a place should be wanting for the entertainment of the phlegm which was collected in the whole Summer.

Hence I lay it down for a position; that the snivel of the nostrils is more watery, and plentiful, and therefore there is a continual cleansing of the same in winter, but not in Summer: whence it followes, that that thing is caused by reason of an untemperate Station: which if it doth occasionally hurt the digestion of the brain, that shall be, either throughout the whole brain, or in its lower plain, whereby the cold strikes: If it be offensive throughout the whole brain, all the functions of the brain should be hurt together with it, the imagination, the discourse, &c. which is false: For it should denote a superiority of the encompassing Air over the Spirit, the Fountain and Ruler of all Functions: And then the snivel ought to be made, and to descend from all the intimate, connexed, and least particles of the brain, and not onely from those which may immediately be shaken by the entering Air.

Whence it is manifest, that snivel is onely an excrement of the lower parts of the brain, degenerated from the totality or wholeness of its nourishment, before it could nourish: But that it is not an excrement surviving from the last digestion, which they affirm to be dispersed in manner of a dew, by the least pieces, into the solid parts: For this also doth equally exhale in manner of a vapour, no lesse from the brain, than from the whole Body. If therefore snivel be naturally stirred up by external occasional causes, and hurtful seasons, and hath its effective cause about the plain of the brain, which way it toucheth the Air, but not from cold; for that would sound that the brain were conquered, overcome, and its powers as it were extinct; therefore the matter of snivel (which I shall teach in its place, to be the matter of the Liquor *Latex*, and also of nourishment) is converted for a good and ordinary end: which conversion of that matter, seeing it is natural, is extended as it were a Coat of Mail on the part stricken by cold.

And seeing the matter is vitiated through the injury of the Air, surely it doth not adhere, but doth distil a continual drop of water: Therefore I call this effective power of snivel, the Keeper: which thing, to have thus now supposed, let it be sufficient. Furthermore, the

the excrements of the Paunch, and Bladder, are indeed the superfluities of the whole Body, and of the parts wherein they are made and do grow, they being superfluous and unprofitable, from within themselves: But sweat, and an unsensible efflux, are superfluities now made in the last digestion, and expelled after the utmost discharging of their ends.

6 But snivel is of a neither kinde: For it is made by the Keeper onely, provoked indeed; but he is that, which that he may defend and oversmear the part, doth thus change the more crude juyce, and also the venal blood; and that changing of the same is plainly natural, ordained to a good end, as long as it riseth from a well appointed keeper. Truly I do also greatly wonder at the drowiness of the Schools for so many Ages: That because they saw the snivel to distil thorow the Nostrils, therefore they suddenly by an undoubted Statute, decreed, that the same was nothing else besides the excrement of the brain: yea whatsoever is thrust forth by spitting and cough (because the likeness of Colours deceived their eyes) they dictated it to be nothing but a descending excrement of the brain: For neither have they once by the way enquired; If it be an excrement of the brain; therefore it ought to be the remainder of the last digestion: when indeed the Arterial blood, after that it is made a nourishable humour, and distributed in manner of a dew, throughout the equal masse of the brain, should not indeed be consumed in the same place, although now first being assimilated to the substance of the brain, and being expelled, should depart thorow the pores without any remainder of it self, by an unsensible transpiration; but altogether by a diverse or strange kinde of defilement, after that it had put on the condition of a spermatick muckiness (for we are nourished of those things whereof we consist) the snivel being as it were recalled from the remote windings of diversity of kinde, and being collected at length into its Cup-board, nigh the Nostrils, should be expelled: For they which touching at the uses of parts, have so greatly provoked themselves to the Gummy Itch of a well-pleasing laughter, have not indeed once touched at what should be the cause of so great an abuse in this digestion.

7 Because, if an excrement be a superfluous part of digestion: should an old man consume more Arterial blood in his brain (because he cleanseth out more excrement) than while he was young? Is therefore the Arterial blood being now half cocted, and vital, then at length corrupted into a similar substance of Sperme? And being thereby on every side recalled from the remote or far scattered places of the brain, is it also collected by the least Atoms of Reliques? Are these things thus daily performed in healthy persons? and is an estranged corruption of the Arterial blood, together with the enjoyment of health? wherefore hath not the same thing happened to the rest of the bowels, which hath happened to the head? what if three ounces of snivel be daily expunged, hath there happily remained a tenfold quantity of good blood (to wit, forty ounces for the brain, and as many at least for the other parts) that it may there be co-sprinkled in manner of a dew? For by what priviledge, or by what necessity doth the lawless brain rejoyce, being a bowel so noble, that it should endure a daily slaughter or ruine of its own Family-Government, without hurt? The confusion of corruption and alienation? After what sort in the middle way of transchanged venal blood, shall the brain wander unto a spermatick and vital Muscilage by so ordinary an exorbitancy, and should be corrupted by the error of digestion abounding? For was not the use of another thing even thereby made manifest, and the necessity of that which is not yet known, which might not return backwards from on every side out of its hidden and least cells (to wit, in the likeness of the Identity of the substance of the brain it self, and of a digestion capable of equality throughout the whole) corrupting by an ordained motion, its own & proper nourishment, with the same force whereby it had entred, that it now departing into an excrement, it might be ad-united within the Cup-board: For if that thing do happen in the middle of digestion, or for fear of labour; now that cannot but bewray an unexcusable corruption, native to the brain; or if that doth happen in the end of digestion; for besides the diverse kinde, and as well the same and ordinary rule of so alienated a digestion, and now also the course and tract of the venal blood into the remotest and similar parts of the brain, and the re-course of the excrement from the remainder being left of arterial blood; the pains of the brain should be altogether vain, its digestion cruel, its error intolerable, and its daily labour foolish.

8 For if any of these things be true, I suppose the brain to be the most miserable Cottage of the whole Body: to wit, to want a greater nourishment, the troubles and labours of the brain to be more intently increased, whereby the force, efficacy, and digestion of the Head is the lesse, slower, and sluggishier: for what had compelled the Brain thitherto, which while the more vile parts do rightly digest their nourishment, and do well disperse the whole into Air; that the onely and miserable brain, through so plentiful a deluge of snivel, had alienated its own and lively nourishment.

As yet pass by the trifles of Catarrhes or Rheums; raining down with so large and continued a shower, into the breast, and the whole habit of the body: For after what sort shall the chief powers remain safe, which they will have to abide in the case of the Brain, while there is so great a rumour, confusion, and so abundant a diversion of digestion, to wit, a tumult of muscilage returning, and arterial blood going expressly to the corrupting of it self? But it hath not been once thought even hitherto, whence so great plenty of Snivel should proceed: but the Schools have slept *Epimenides* dream or sleep, being as it were fed with *Lotus* or a feigned tree; so that they may treasure up a little advantage from their credited Catarrhe: for neither is ordinary Snivel from venal blood.

And that thing the Schools might have easily taken notice of, if they had not been accustomed in subscribing to trifles: For truly, from great thirst a large quantity of drink doth presently bring forth a poorly muckiness in the throat, instead of spittle: And so the disease affects of the throat do pretently thicken all spittle: And therefore the Faculties, which from the use of their necessity, I call the Keepers; its no wonder if from the whole race of our Reeds or Pipes, they do naturally allure unto themselves another liquor besides venal blood, (which I therefore first do call the *Latex*, and will describe in a particular Tract) and adopt it into their own borders, to wit, no more unprosperously than the Kidneys do separate the Urine from the venal blood, and draw it unto themselves.

For I do here thrust in the Urine, because it is not an excrement of the Reins, as if it should be the remainder of the nourishment of a Kidney, or a committed error of its digestion. Therefore I give the same judgment concerning Snivel.

Therefore, in the pose, as long as the evil doth mostly rage, and the North wind is more fierce; by so much also is the Snivel the more watery, yet under an equal digestion of the Brain, and the health of the senses, as well internal as external. Therefore the thicker, rougher, more sparing, and more yellow snivel is praised about the end of digestion (as they say.) Then next, I consider, that from our small brain, so great a quantity of excrement cannot daily be severed, by reason of the unaptness of nourishable venal blood:

Especially, because the Liver doth bring forth no excrement from it self; or from its own nourishment; Yet is it nourished, and the like fortune of digestions and equal weight of excrements ought to grow on all the Bowels proportionable.

At length, I remember that the nourishment of the solid parts are made, with the transmutation of the whole venal blood into nourishment, without a separation of the pure from the impure (because it is that which should be too troublesome for the Bones, Sinews, Bowels, &c.) Neither do the solid members therefore yield another excrement in their nourishing, unlesse, after that the nourishing liquor hath satisfied the hunger of the parts, the whole is equally consumed into a very transpiring vapour; that is, There is not made an excrement of all the solid members; while nourishing is in making, but onely in its being made. Indeed then the whole doth exhale, according to the consent of the Schools. Therefore, because the Brain is held by the lawes of all the solid members and bowels; which the *Archæus* prescribeth; there shall be no muck of the Brain, neither shall it yield any other thing in the place of an excrement, than that which it wholly exhaleth by transpiration; after the manner of other members.

Again, an excrement is a Relative unto digestion, which is made in the thing nourished, because it supposeth the same: But nevertheless, Snivel is not an excrement of the aforesaid digestion, or the univocal or simple work of the vital *Archæus* should cease to be in the digestions of the similar parts.

Moreover, if Snivel should be an excrement of the brain, it should be collected from on every side from the whole, and should betake it self unto a like Cell; but not unto the Basin: But a collection of the Snivel, (that is, of a common excrement, and of the whole brain) from the unperceivable, and all the least parts of the brain, should be difficult, but that it should leave very many obstructions, &c. behind it, which nevertheless do never stand in the way; especially because the brain is nourished by a few and slender veins throughout its whole body; neither doth a passage or channels appear, whereby the Snivel may be derived.

Likewise also, the thorny marrow should inlike manner have its own muck, and while it should endeavour to evacuate it, that ought to be done, either from above by the fourth little bosome of the brain, or falling downwards (as a body otherwise fluid, when it is deprived of life, is born alwayes to fall down) it should stop the common principle of the moving sinews, and especially because Snivel hath the roughness of a muscilage, it should not be so easie a follower, but that it might alwayes leave from it self a sorrowful fear of stoppages.

- 18 In the next place, Snivel, after what manner soever it be taken, and stirred by a luke-warmth, doth never wholly fly away, or is unsensibly dispersed without its remaining dreg: but its vapour being assumed, it is plainly hardened into a *Tophus* or sandy stone: And so an excrement of the solid brain, or from the whole similar part thereof, is unprofitable, yea un-
- 19 possible. For it wholly resisteth the thicknesse of the brain, the which, seeing it is not open by pipes or channels, yet that it ought from on every side to be every where continually filled with a tough excrement. At length, by having respect unto the ends for whose sake every thing was made by the Creator:
- 20 Surely, there doth not any aim appear, why the brain doth prepare snivel as the superfluous excrement of its own digestion, and doth thus far make it self an out-law from the rest of the bowels: For the whole nourishing liquour is at length severed from the whole body by an unsensible transpiration, without any remainder of it self. Seeing therefore there is such an evident inequality of Snivel in Winter and Summer, that could not come from an internal foundation of mixture, but from elsewhere: And so Snivel is not the dung of the venal blood, much lesse of the brain.
- 21 For it happens to a man well in health, and sleeping, that he doth not eject any thing of Snivel for eight hours and more: under which period notwithstanding, the brain finisheth a full digestion: how much more, because the natural faculties of the brain, as also of the whole body, do never keep holiday. Therefore the Snivel is not an excrement of a thing, neither is it made by the intent of a natural digestion, neither is it a foreign excrement collected here and there by the brain, and brought back into the basin its natural emunctory or expunging place, nor framed through the vice of digestion; seeing that else the brain should suffer a continual disease, and especially in Winter.
- 22 Therefore the testimonies of the Schools in the behalf of phlegm do fall to the ground; and then their foundations of a Cararrhe; and lastly, those helps which are drawn forth by the method of healing, from both the foregoing particulars. Indeed they have erred in the shewings of Causes and Remedies from the matter, efficient, beginning, place, conveyance, sliding or falling down of Snivel. Wherefore, we must fitly take notice in the first place, that healthy eyes have no excrements or filths.
- 23 But that bitter excrement which the Ears do sweat forth, is little in one in sound health, and it is exhaled in the last period of digestions, which is plain enough to be seen: for truly by how much the deeper thou shalt scratch within thy ear, thou shalt find so much the lesse of filth, as a sign, that it hastens outward in manner of a smoaky vapour: no otherwise than as the toes do collect their own moisture, bran doth grow to the basin, &c.
- 24 For indeed the air ought by every storm and courfary succession of tempests, to be immediately drawn inwards, as well to the lungs, as to the instrument of smelling. Therefore the parent of things, suiting ends or bounds, and dispositions to their own uses and necessities, as it were to a direct mark, hath appointed one Keeper beneath in the last confines of the brain, and another in the winde-pipe; a power I say, before me, neglected, whose property it should be, that as often as the injury of an unexcusable air should rise up against either part, that it should as often oppose the snivel or muck, out of the *Latex*, or more crude venal blood, as it were a garment, and as a partition against it; against which, the raging air, the inclemency of its first stroak being partly laid aside, should wax mild, and partly conceive within it self the blemish conceived by the air, and should wash off the gotten brand, (if happily any should be imprinted on the part by a sufficient quantity of Snivel. And that thing is first of
- 25 all written on the distilling Pose. For a small offence of the evening Air, or a blast of a more cold North-winde, I suppose hath given occasion, that the Keeper might object his own muck, which being exorbitant, besiegeth the spongy bone, through which the Organ of smelling doth receive its odours; which wandring and watery Snivel, the Keeper doth at first endeavour to wash off with a plentiful liquour *Latex*. And then, when as this is made void unto him, he brings forth a more tough Snivel, to wit, while the other is made more glewy in the *Ethmoides* or straining bone. In like manner also, hoarsnesses do happen through Snivel objected by the Keeper.
- 26 For the Keeper being a delegated power, that he may break the injuries of the air, and fence the part from cruelty through error, he doth now affect the wind-pipe, and affixeth muck on it for a coat: Then, as if it repented him of his error, he first brings forth watery, and then glewie excrements, wherewith he intends to wash off the opposed filths. But that which I have now determined concerning hoarsness in the beginning of the throat, let the same thing be judged, if the trunk of the rough artery or wind-pipe be the more low or downwards beset, to wit, when as that which I but now before spake concerning hoarsness is cast out of the breast by Coughs.

There-

Therefore the Snivel of the nostrils dropping down from above, even as also that which is spit out by Coughs, doth take its rise from the Keeper the faculty, an excrement indeed in it self profitable, but through error of the Keeper, hurtful. But I call these powers placed at both the folding doors of the gates of the air, Keepers or Watchmen, and oft-times erring or wandring ones, while by reason of a frequent strife with forreign injuries, the Keeper doth not rightly execute his Offices. Yet the Keeper is not to be numbred under the Quaternion of faculties (to wit, the attractive, digestive, retentive, and expulsive.)

Because it doth not onely expell its own, but also frameth its own, and indeed onely excrements, which are not made by digestion, but by an abortive or miscarrying power.

Wherefore the Schools have altogether neglected both these Faculties prefixed before the doors of the Brain, and Lungs, and have dedicated both, onely to the Brain, and have accused onely the distemper hereof, in those who are in the most perfect health.

As long the Keeper is in its right strength, as a Conquerer of the Cruelty of the Air, it overcomes: but when, by reason of its much broken strength, it cannot satisfie its first ordination, according to its desire; it at least frames much Snivel, that it may wash off the conceived blemish, in separating, about which it was not at first bruised. Therefore the Keeper differs from the digestive and family-administring property of the Brain.

And it happens that one is hurt, the other remaining safe; which truth, sneezing medicines do discover unto us, which do, presently after the neighbour Snivel being dispatched, stir up meer waterishnesses, most speedily brought forth by the provoked Keeper; So that at length, if the sneezing medicine shall be the sharper, fibers of venal blood do fall down with the thin muck, and a salt water waxing pale, is expunged from the red: According to the Proverb, he that expungeth too much, doth at length draw forth blood. For the red blood began to wax palish, which through the troublesomnesse of sneezing, was untimely drawn or allured, otherwise it had been snivel.

Therefore the Keeper doth first of all witnesse Divine Providence to have watched over both Bowels, in so ready and frequent a necessity: Also they do bewray the effects, not indeed of the digestion of the Brain, and Lungs, but of their own proper power, which neither brings forth disease effects, unlesse it wander from its mark.

Therefore it is false, to have said that a pose is healthy, as being the expunger or wiper out of filths: For the Offices of both the Keepers, and their errors, I have by the way already touched: Now moreover, for the confirmation of the granted Doctrine, I will explain the exorbitances of the wandering or erring Keeper. As the Keeper hath received its Lieutenantship, chiefly by reason of the cruelties of the adverse Air; so it also moderateth the same, taking to it a matter obeying its functions, to wit, out of the masse of the whole, to wit, of the liquor *Latex*, and venal blood: Which Doctrine, although it shew a novelty, and for that cause may carry difficulties with it; yet the ignorance of Ages is never able to prescribe to the truth.

For first of all, a multiplicity of matter being drawn out under the error of the Keeper, sheweth the same not to be the excrement of the brain, otherwise sound and strong: Therefore the instinct of preparing, speedy, ready, and diverse mucks, is raised up from elsewhere. Indeed the Powers are for the washing of the filths off the atomes of the air, therefore placed at the doors or entrance of the Bowels that are passable for Air. Surely all things proceed well, and orderly, so long as the Keeper doth not exceed its own limits: But seeing all humane things are exposed to ruines, where, as often as the Keeper wandreth from its aim, presently, Poses or Distillations, Hoarinesses, Coughs, &c. do invade us after a miserable manner.

Concerning the Grief or Stuffing of a distilled Rheume or Pose, I have already spoken sufficiently: Now moreover I will speak of the Cough.

The Cough ariseth from a feeling of that which is hurtful, troubling the wind-pipe from the beginning thereof even unto the bottome or depth of the Lungs, to wit, smoaks, smoaky vapours, sharp exhalations, minerals, and likewise moist vapours, stinking ones, &c. At length, cruel cold overcomes the force of its Inne, as if tending to the extinguishing of the vital guest. The Cough therefore is an effect of the act of Feeling: for as soon as the spirit implanted in those parts is grieved with a trouble leaping on it from without, the Keeper presently performs his own office: For that unnamed Faculty doth readily call to it as much out of the mass of the juyce *Latex*, as seemeth fit for it, and transchangeth it into snivel, which in manner of a dew it thrusts forth unto the wind-pipe; whereby the injury of the Air may the lesse nakedly and immediately affect the solid part it self; but may break it self against the aforesaid coat of snivel.

But alas! when either the outward injury is greater than that which may suffer it self to be mitigated by touching, or doth more deeply strike the very substance of the wind-pipe, or

- Lungs; now the Keeper stumbleth: neither doth it withdraw its aid onely from the Latex, but doth alienate the very substance of the next nourishment, and wander into a muckie glew: indeed so much the nearer to the immediate nourishment of the Bowel, by how much it shall come deeper unto a Colour of yellow, looking ruddy, and nearer to redness, and having slidden from that Colour, it returns into its former Colour, while it shall approach from a ruddy Colour, nearer to the yellowness of Chasse, and from thence at length unto the similitude of the white of an Egg. Hence on the other hand, in hectick Fevers, the snivel becomes bloody, and assumeth the Colour of the more dark ashes, while the very substance of the nourishment it self being transchanged, departs, and doth there shew forth a failing integrity of life: Then indeed the stinking smell of a dead Carcase beginning in the breath, doth bewray the faintings or doatages of the *Archeus* of the Lungs: Therefore the snivel doth readily serve for a partition wall between the hurtful thing coming unto it, and the forces or strength of the Inn: wherefore it hath a saltness brought to it as the prick of its expulsion, that it may provoke the feeling of the Wind-pipe. And in the smallness of Salt snivel, Coughs are dry. But because old Age is likened to a defect, and the Lungs are first deficient (as above) hence Coughs are natural to old Age, as it were by property, and they are scarce silent, do scarce cease, or are restrained, worn-out nature not admitting a restauration: These things of the Cough. Concerning the Remedy thereof, nothing hath been dreamed of which may be profitable: For first of all they have given to drink the decoctions of Herbs and Colts-foots, but with what an unprosperous event, almost every house doth mournfully detest by its own Law. At length, decoctions being lesse successfully used, it hath made the Physitian to meditate of Tablets made or confectioned of Sugar: lastly they have receded into Syrupes and Lohochs, hoping (I have shewen that to be ridiculous in its place) that by swallowing slowly, the spittle together with the *Eclegma* or *Lohoch* would slide down through the chink of the voice into the VVind-pipe: Nor having regard, that there would be a straightning of breathing, Coughs, choaking, and expectorating, of greater misery, by reason of the admitting of a forreign guest, than the Cough it self becomes, which stirs up such unhappy fictions of help: which things I have elsewhere on purpose opened at large.
- Alas! and a wretched remedy of Fox-lungs hath also entred, whereby the poor living Creature may bestow the power of his daily race, which living, he possessed, on Sugar, after death: For the Schools, and the dispensatories of these, have been wholly ignorant, that the Lungs is only a sieve of Brasse, neither that it doth bring any help at all unto the in-breathings of a daily motion: They are ignorant I say, that it affords no comfort to him that is lame, or hath the Palsey, although he should daily eat Hares feet, or Stags-feet.
- At length, the rout of *Chymists* succeeded, who when they saw the ground where *Sulphur vive* groweth, to wax dry and barren, (but I call the *vive* or quick, naked Sulphur, & that which is not exacted out of the Firestone, or from elsewhere) they likewise hoped, that snivel the offspring of the Keeper, was to be dried up by Sulphur: which thing the Schools hoped to finish by the flour of Brimstone: Therefore some have sublimed that from Aloes, Saffron, Myrrhe, and burnt Vitriol: But others afterwards tryed to solve it by Lime, and Alcalies, which they have named the milk thereof, surely a stinking one: but that lost its credit, after that the milk, yea the yellow Liquor of the Sulphur being prepared with Lime, Vinegar being powred on it, the antient Sulphur returned again unto it self. Indeed they have covered the stomach with a various Visard, that they might restore the defects of the Keeper placed in the entrance of the Wind-pipe, and the apprehended blemishes of hurtful things: For so the hope of the sick, and the purse hath been divers wayes deluded. I deny not indeed, that Sulphur fitly resolved, doth relieve or help the Asthma or shortness of breathing:
- But that Asthma is not the guest of the Lungs, to arise from its proper Epileptical passion: to wit, whither those Sulphurs have not entrance: But the nest of that Asthma is about the Stomach (which I shall teach afterwards) which way also there is an entrance for the Sulphur the helper: Furthermore the saleable floures of Sulphur are from the vein of Brasse; For the veins are burnt with a slow fire, that they may thence drive away the cheevish Sulphur: For else the Sulphur would snatch a great prey of the Brasse: Therefore let every one who hath known why *Arsenick* hath obtained the name of the fume or smoak of Mettals, well consider the strength of that Remedy.
- Truly, the Lungs doth speedily hearken to the destruction of it self, and there is a very difficult restoring of its sliding life: Also the Lungs doth scarce obtain help by nourishments, which have through so many shops of digestions, long agoe laid aside the endowments of their natural disposition, before they enter unto the Lungs: And it is little, although they have reserved a small quantity of their antient Odour from their own composed Body, in their middle life: For that is unefficacious enough and unsuitable or unequal for restoring their weakness.

weakness: And that is especially more manifest in the Inn of the Lungs; where the power of the Keeper, according to his pleasure, doth retort, alienate, and corrupt its proper nourishments that are immediately to be assimilated or made like unto it: Wherefore I have expelled Minerals from this aim or scope (except the greater Secrets) because they are those which neither have a passage to, nor have contracted a familiarity with the implanted *Archens* of the Lungs. I have also examined the Remedies throughout all their Ranks or Orders, and those vulnerary ones have promised singularities, which do appease the *Archens*; next, which do divert from corruption, and hence do restrain the wonted furies accustomed to the wound: But not that I hope that those Remedies can reach unto the Lungs, or vvind-pipe in their former power (even as I shall elsewhere make manifest more commodiously on purpose:) But onely I did meditate, that although the defects of Coughs were not separations of the Continual, as neither that spittings were corrupt Pus; yet that a vulnerary potion is that which might afford a nourishment to the whole Inn of man, of such a sort, that it might materially, and efficiently by it self, employ it self in restoring the exorbitancy as well of the *Archens*, as of the Keeper.

Therefore there was a great necessity of both Keepers to wipe of the inspired filths, which 42
else being brought inward, would willingly affix themselves to the moist sides of the Ribs, and the Breast would presently thereby in all its parts, be filled up with a Clay: wherefore the snivel which should receive those opposite filths, ought to sweat out, as well in the entrance of the vvind-pipe, as before the Organ or Instrument of smelling: Snivel I say, and not water was necessary, because this would presently hasten drop by drop into the bottom: But the inward parts ought to be moist, least through a continual in-breathing of Air, they should chap or cleave alunder: Therefore a certain distributive virtue ought to accompany the continual moisture, such as is that which dispenfeth the Spittle: I say a moderate, and flow or gentle moisture, ought to be borrowed out of the masse of the juyce Latex, in healthy persons: but when as the Keepers are ill affected, they do continually weep out part of their own nourishment, which they ought to assimilate to themselves; To wit, it being diversly altered in the form of water, or also of a transparent, or thick Muscilage, according to the variety of passions whereunto the Keepers have hearkened.

But the restoring of the Keepers from weakness, is very difficult, and that of the vvind-pipe 43
more dangerous or destructive than that of the Nostrils, because it threatens a Consumption, doth alwayes gape, and is molested with a plenteous Air. At length, it never satisfied me, that the snivel of the nostrils, although not much unlike to the snivel of Coughs, in colour, taste, and aspect, should be the same with that which is expectorated from the inward pipes of the Lungs: For I could not perswade my self, that the same snivel should proceed from 44
two Bowels so diverse: (For if it be the same and co-like, then that one onely snivel is not the superfluity of both bowels) therefore, as the Keeper being well affected, doth scarce produce any snivel, and that likewise according to opportunity; so being provoked, it brings forth snivel according to its own indignation, and the property of the bowel receiving: To wit, a fury being snatched to it, it brings forth a Salt, biting, sharp and stinking thing or quality in its snivel, exceeding a mean in quality and quantity! For from hence are their gnawings of the vvind-pipe, and from thence Consumptions and bloody spittings, &c. For although an Imposthume full of matter may bring forth divers difficulties of breathing, and straightnesses of the Breast, yet scarce Consumption-Coughs: Therefore I have thought these to spring from the hurting of the rough Artery or vvind-pipe.

But that the Keeper doth not touch at the Essence of the Brain; I conjecture from a 45
strong young man, to me known, who morning and evening, hath daily undergone miserable spittings by reaching, for some years, he being in the mean time, strong enough in his Brain, Sinews, and Muscles: But where one of the faculties is notably hurt, but the other not at all, they must needs be both divers in property and Essences: wherefore also the Keeper of the vvind-pipe, and Head, do far differ.

Therefore the Air, after that it is brought down thorow the Lungs into the Breast, and thrusts downwards the very transverse partition (which is named the *Diaphragma* or *Mi-* 46
driffe) into a circular form, then therefore the *Diaphragma* pierceth the pores thereof, and straineth the drunk-in Air thorow it self: which thing, Odours drawn by some nostrils, and at length returned by belching, do teach: For so the fume of Coals doth provoke vomit, and doth sooner affect the Stomach than the heart: yea the Sent of a dead Carcase is felt about the Stomach long after. So also a VVoman great with young, bearing long a dead child, the very dead Carcase smells in her breath.

For that smell passing thorow her Womb, and Midriffe, teacheth that breathing is serviceable, not onely for the cooling refreshment of the heart, but for the whole Body: So also from a pining fume, others have shewen that their Stomach was tinged with yellowness by reason of smoaks: So also the Stomach abhorreth the smells of loosening Medicines received, although those very purging Medicines are cloaked with Sugar and Spice, because it perceiveth the same Odours by its own smelling: Therefore if an Odour doth proceed in a straight line unto the Stomach, the Air also doth. The Plague it self being introduced by an inspired breathing, is forged for the most part, about the Stomach: therefore vomitings, Head-ach, drowiness, &c. do accuse and shew the Stomach to be affected.

CHAP. XXXV.

The Image of the Minde.

1. *The fear of the Lord is the Beginning, and Charity is the end of Wisdom.*
2. *Man was made after the Image of God.* 3. *Three Ranks of Atheists.*
4. *The Authours wish.* 5. *The Intellectual Understanding of the minde.*
6. *The intimate Integrity of the minde, suffereth by frail things, without the passion of extinguishing.* 7. *The action of the minde is scarce felt or perceived in us.* 8. *The first Atheists are scoffers at the divine Image.* 9. *The second Atheists have newly arose.* 10. *The Atheistical ignorance of this is manifested.* 11. *The variety of vital Lights.*
12. *The minde, how it differs from an Angel.* 13. *An intellectual Vision of the Authour.* 14. *Every wish or desire without God, is vain.*
15. *The Authours misery.* 16. *The Vision of the minde being separated from the Body.* 17. *That the minde is figured.* 18. *The minde is an immortal Substance figured with the figure of God.* 19. *A common error about the Image of God.* 20. *The error of those who think the Image of God to be placed in a ternary of Powers.* 21. *Against the opinion of Taulerus.* 22. *The Image of God in man hitherto not evidently shewen, because it is incomprehensible.* 23. *The minde is damned by accident.* 24. *After death there is no more memory, or remembrance.*
25. *The will was accidentally over-added to the minde after its Creation.* 26. *In Heaven the will is void.* 27. *A will appears in Heaven, not indeed a power, but a substantial intellectual Essence.* 28. *If the minde be the Image of God, this was known to Plato.* 29. *The definition of the minde.* 30. *That Reason is not the Image of God.* 31. *The Authours Opinion.* 32. *These two thinglineses or Essences, do lay hid in the Soul, through the corruption of Nature.* 33. *This love is onely raised up by an extasie; not otherwise, in the miseries of this nature.*
34. *A precision or abbreviating of the Understanding.* 35. *An Objection is solved.* 36. *That a triplicity or ternary in the minde, is unfolded in every Systeme or Constitution of the World.* 37. *A Similitude for the Image of God is far another thing than that of a ternary.* 38. *A repeated description of the minde.* 39. *How the minde doth behold it self.*
40. *The constitutive Birth of the Phantasie.* 41. *The minde doth understand far otherwise.* 42. *The Prerogative of the minde.* 43. *An explaining of living love.* 44. *The differences of Understandings*

in mortal men. 45. Why that desire doth not cease in heaven. 46. A description of desire. 47. How sin is in the desire of the mind. 48. The love of the mind is a substance even in mortal men. 49. How great darknesse hath veiled the minde by the corruption of nature. 50. The Image of God quite marred or trodden under foot in the damned.

THe beginning of Wisdome is the fear of the Lord ; but the fear of the Lord begins from the meditation of eternal death and life : But most of the Moderns (with the Stoicks) suppose the end of wisdome to be the knowing of ones own self. I call the ultimate end of wisdome, and the reward of the whole course of life, Charity or dear love, which accompanieth us after other things have forsaken us. Wherefore also, the knowledge of ones own self, according to me, is onely a mean unto the fear of the Lord.

And the knowledge of life doth presuppose the knowledge of the soul ; because the life and soul are as it were Synonymals. And indeed, it is believed by faith, that man was created into a living creature of nothing, after the image or likenesse of God, and that his mind is never to perith or die ; But that other souls, when they cease to live, do depart into nothing ; The weights of which difference elsewhere, concerning the birth of Forms.

But hitherto it is not sufficiently manifest, wherein that likenesse with God, our Archetype, or chief or first Example, doth consist. I will speak what I perceive under an humble subjection to the Church. There is no knowledge more burthensome than that whereby the soul comprehends it self, although none be more profitable, Because the whole faith doth stablish its foundation upon the unobliterable or undefaceable substance of the soul. I have found indeed many Demonstrations divulged in Books, about this Truth : but none of them at all, wherefore, or for what cause it is so, in respect of Atheists, who deny the one onely and constant Power, or Deity from everlasting.

Indeed Plato hath determined of three ranks of Atheists ; to wit, one which believeth no Gods ; And then another sort, which indeed doth admit of Gods ; yet such as are uncareful of us, and despisers of small matters, and therefore also ignorant of us. Lastly, a third sort, which although they believe the Gods to be expert in the least matters, yet do suppose that they are flexible and indulgent toward the smallest cold prayers or petitions. This most frequent sort of Atheists is among Christians at this day, especially those who professe themselves the most perfect. Indeed they dare do any thing, they grievously impose burdens on the shoulders of others, which they touch not so much as with their finger ; they sweep the purses of those that believe, and set heaven to sale to dying men, and do every where mingle themselves in secular and unknown political affairs, as they have married Religion to Political matters.

And as they see themselves Schoolmasters, Deputies for the instructing of sorts of children ; so also they being ignorant persons, bear in hand, that they are fit for the Stern of the Common-wealth. Verily, it should be my greatest desire, That it might be granted to Atheists, to have tasted, at least but one onely moment, what it is intellectually to understand, whereby they may feel the immortality of the mind, as it were by touching. I am even willingly ignorant of the rules and manner, whereby I might illustrate the understanding of another : yet I am deservedly sorrowful, that they who do alwayes enquire into the truth by studying, do never, notwithstanding, come unto the knowledge thereof. Because those who are blown up with the Letter, have not charity, but avarice and ambition doth hide Atheism in them.

But I long since learned, that our mind doth understand nothing by imagination, nor at length by Figures or Images, unlesse the wretched and miserable Discourse of staggering reason shall have access to it.

But when as the soul doth comprehend it self, or in it self, intellectually, reason faileth it, and the Image of its own self, whereby it may represent it self to it self ; that is, the soul cannot apprehend it self by reason, as neither by Images or likenesses. After that, I had known that the truth of essence, and the truth of understanding have pierced each other in unity, and identity or samelienesse, I knew the Understanding to be a certain immortal thing, far separated from frail or decaying things. Truly, the mind is not felt or perceived, yet we believe it to be within, not to be tired, nor disturbed by Diseases.

There-

6 Therefore sleep, fury or madnesse, and drunkennesse, are not the Symptōms of the immortal mind being hurt, but onely the Pages of life, the passions onely of the sensitive soul; for brut beasts also do even undergo such passions: For neither do I think it a meet thing, that an immortal thing should suffer by things mortal, and be subjected, or overcome by the: For the mind feeleth and suffereth the torments of hell, yet it is not overcome, as neither is it extinguished: So it being knit unto a frail light, it suffers by frail things. But as the minde is in us, yet is not perceived by us; so the continual, and unshaken operations thereof are unperceivable: For that which is in it self perceivable or sensible, cannot at all be spiritual, and meerly abstracted: And indeed neverthelesse, although it may seem to us, that we understand nothing by a total abstraction or withdrawing of Discourses, and sequestration from all things which may fall under Sense, under the Mind, and Understanding, (and that under the beginnings of contemplations;) Yet the mind acteth in those things, after its own unsensible manner and spiritual efficacy; which I have thus perceived.

7 For he that confesseth, doth oft-times not feel the effect of contrition, and he greatly bewaileth that his own unsensiblenesse: Yet he being asked, whether he would sin; perhaps he would answer, that he had rather die. Therefore in confessing, there is an unsensible operation of the mind, an effect of a supernatural faith: Because the actions of the Understanding are the Clients or Retainers of another Magistrate: Therefore indeed mytical men do teach, that the minde doth more operate, and in operating, doth also more profit in faith alone, without discourse and cogitation, than he who prayeth with many words, and by discourses doth stir up compunctions in himself. But he is happy to whom it is granted to perceive those unsensible operations of the mind, and to reflect the same into, and over the powers of the sensitive Soul, as operative Faith makes a beginning: Because these do for the most part leave their foot-steps on the life afterwards, and do stir up the memory operating for the future, together with grace, in faith.

8 The first Atheists and Christian Libertines do laugh, as either that the image of God in us, is feigned, or that we were created after the Image of God.

9 But other Atheists of the second sort, do believe, not onely that we were created after the Image of God; but they feign in us an identity with the immense or vast, and uncreated Deity: Neither that man differs in substance from God, otherwise than as a part from the whole; and that which had a beginning, with that which was not principiated: But not in essence, or internal property: Surely it is that which besides blasphemy hath very many blockishnesses:

10 For truly, whatsoever began, for that very cause it is a creature: but it includes an impossible imperfection in God, that he could create any thing besides himself, in substance or essence, a compeer, or co-equal to himself. For it even is manifest by Philosophy, that all the parts of an Infinite, are of necessity altogether infinites; but the creature cannot be more infinite according to its substance, than according as it was to be, exist, and endure, as a co-equal or second to the eternal Being. And therefore it is a foolish thing to believe, that the Soul, which began of nothing, is a part of the Substance of God, or essentially like to him in power, greatnesse, duration, and glory. If therefore God could not make the soul of man as a part of his own Divinity, seeing there are no parts or minorities of that which is infinite: therefore the Soul was not made by God after that manner: Therefore it voluntarily flowed forth of nothing, and had made it self otherwise than before it was. Therefore they do greatly erre, who believe the essence of the Divine Image to be seared in the mind, by the identities of substance and essence, seeing they differ from each other every way in the term or bound of infinitenesse; and the mind of man should of its own accord slide or turn, and be dissolved again into nothing, whence it began, unlesse it were preserved in its essence by the Divine Goodnesse: And the mind hath an eternal permanency henceforward, not from its own essence, but from the essence of eternity freely given unto it, and kept with it: Therefore from elsewhere, and from that which is infinitely more powerful than it self. Therefore it is sufficient, that the mind is a spiritual, vital Substance, and a lightsome creature.

11 And seeing there are many general kinds and species of vital lights, that light of the mind differs from other vital lights in this, that it is a spiritual and immortal substance; but that the other vital lights are not formal substances, although they are substantial forms; and therefore by death they depart or return into nothing, no otherwise than as the flame of a candle.

But the Mind differs from the Angels, that it is after the likenesse and image of the eternal God: for the mind hath that light, and lightsome substance from the gift of Creation, seeing it self is that vital light; but an Angel is not a light it self, nor hath it an internal light natural or proper to it self: but is the glasse of an uncreated light: And so in that, it faileth of the perfection of a true divine Image: For else, seeing an Angel is an incorporeal spirit, if it were lightsome of it self, it should more perfectly expreis the image of God than man. Moreover, whatsoever God more loveth, that thing is more noble for that very cause: but God hath loved man more than the Angel, who to redeem the Angelical nature was not made in the Figure of the evil Spirit; even as the thrice glorious Lamb, the Saviour of the world took on him the nature of a servant that he might redeem man. Neither also doth that withstand these things, *That the least in the Kingdom of Heaven is greater than John*: For the Son of man is not lesse in dignity and essence than an Angel, although he be also made a little lesse or lower than an Angel; because the Son of man in his condition of living, was diminished a little lesse than the Angels, while he was made man; so also was *John*: therefore also an Angel doth alwayes remain a ministring Spirit; but he is no where read to be the friend, or Son of the Father, the delights of the Son of man, and the Temple of the Holy Spirit, wherein the thrice glorious Trinity hath made its Mansion: For that is the famous or royal Prerogative of the Image of God, which the eternal Light imprinteth on every man that commeth into this world.

In the year 1610. after a long wearinesse of contemplation, that I might obtain some knowledge of my mind, and because I then, as yet thought, that the knowing of ones own self was a certain compleating of Wisdome; I having by chance slidden into a dream, being snatched out of the paths of reason, did seem to be in a Hall, dark enough; on my left hand was a Table, whereon there was a Bottle, wherein there was a little Liquour, and the voice of the Liquor said unto me, *Wilt thou have Honours and Riches?* I was amazed at the unwonted voice, I walked about, weighing with my self what that should denote: in the mean time, on my right hand, a chink was seen in the wall, through which, a certain light with an unwonted splendour, dazled mine eyes, which made me unmindful of the Liquor, of its voice, and former counsel; because I saw that which exceeds a cogitation or thought expressible by word; and then that chink presently dispersed: I returning thence unto the Bottle again, but sorrowful, brought this away with me: But I did endeavour to taste down the Liquor, and with long pains I opened the Bottle, and being sore stricken with dread, I awaked out of my sleep. But the foregoing and great desire of knowing my Soul, remained; with which desire I breathed for 23 full years: For at length, in the year 1633. in the vexatious afflictions of Fortunes, yet with the rest or quiet of my life, given me to drink from the safety of an innocent life, I saw in a Vision my mind in an humane shape; but there was a light, whose whole homogeneous body was actively seeing, a spiritual Substance, Chrystalline, shining with a proper splendour or a splendour of its own: but in another Cloudy part it was couled up as it were in the husk of it self, which whether it had any splendour of it self, I could not discern, by reason of the superlative brightnesse of the Chrystal spirit contained within: Yet that I easily observed, that there was not a sexual note or mark of the sex, but in the husk. But the Seal of the Chrystal was an unutterable light, so reflex, that the Chrystal it self was made incomprehensible; and that, not by a denial, otherwise, than because it cannot onely not be expressed in word; but moreover, because thou knowest not the essence or thinglinesse of the thing which thou seest: And then I knew that that light was the same which I had seen for twenty three years before, thorow the chink: I likewise from thence comprehended the vanity of my long desire.

For howsoever beautiful the Vision was, yet my mind obtained not any perfection to it self thereby: for I knew that my mind in the dreaming Vision, had acted as it were the person of a third; neither that the representation was worthy of so great a wish.

But as to that which hath respect unto the Image of God, I could never conceive any thing, not indeed in the abstracted meditation of understanding, which would not by the same endeavour, bear some figure before it, under which it should stand in the Considerer: For whether I shall conceive the thing in imagining it by its own Idea or shape; or whether the understanding doth transchange it self into the thing understood; A concept hath alwayes stood under some shape or figure: For neither could I consider the thinglinesse of the immortal mind with an individual existence, deprived of all figure, neither but that it at least would answer to an humane shape.

For as oft as the soul being separated, doth see another soul, Angel, or evil Spirit, that is made with a knowledge that these things are present with it, while it distinguisheth the soul of *Peter* from that of *John*. For truly such a distinction doth happen onely by a proper

vision of the soul, which vision of the Soul includeth an external interchangeable course, and therefore also a figural one: For truly an Angel is so in a place, that at once, he is not elsewhere; wherein as well a local as a figural circumscription is of necessity included.

- 17 And then, the Body of man as such, cannot give unto it self a humane shape: therefore it hath need of an Engraver, which might be shut up within the matter of the seed, and that had descended into it from elsewhere: yet that Engraver, for as much as it was of a material condition, it hath of it self no more power of figuring, than the Masse of the Body it self. Therefore something doth precede in the masse or lump, which should be plainly an immaterial, yet a real and effective Beginning, wherein there should be a power of figuring by the impression of a Seal: Therefore the Soul of the begetter, while it slides outward, and doth lighten the Body of the seed, in a certain Air, it delineates the Seal and figure of it self, which is the cause of the fruitfulness of seeds: Otherwise, if the Soul should not be figured, but the figure it self of the Body, should as it were of its own accord be formed; now the Trunk in some member, should also generate nothing but a Trunk: for that the body of that generator is not entire, but at least faileth in the implanted Spirit of that member. If therefore the shape be implanted in the seed, it shall receive that Image from a vital and former Beginning, out of it self: But if the Soul doth imprint a figure on the seed, it shall not dissemble a forreign or strange face, but shall decipher its very own Image: For so the Souls of bruit Beasts do keep their own particular kinde in generating: But the minde, although by reason of its beginning, it be above the Laws of Nature; yet by what foot it hath once entred the threshold of Nature, and is incorporated and joynd unto another, it is afterwards also restrained by its own Laws: Because there is a univocal or single progress, ascension, descension, limitation, and end of vital generations: For neither otherwise doth it want absurdities, that the operation of so great a thing (as is the generation of man, and the continuance of his Species) should happen without the co-operation of the minde. Therefore it must needs be, that fruitfulness is granted to the seed by a participation, and specifical determination of vital principles: which thing surely, doth not otherwise happen, than by a sealing of the Soul in the Spirit of the seed, whence the matter obtains a requisite maturity, and a delineated shape or figure, that at length it may obtain by request, a formal light of life from the Creator, or the Soul of its own Species, the similitude whereof is expressed in the figure.

- 18 Furthermore, it is of faith, that our minde is a substance never to die: The new framing of which substance of nothing, belongs onely to the Creator; who if it hath well pleased him to adopt the minde alone, into his own Image, it also seems to follow, that the vast and unutterable God is of a humane figure, and that from an Argument from the effect, if there be any force of Arguments in this subject.

- But because the Body is oft-times defectuous, they have thought the glorious Image of God the Arch-Type, represented in the minde, to consist onely in the power of Reason: Not knowing that the rational power is a servant to the understanding, but not of its essence, as neither its unseparable companion: which thing I have already explained in the Treatise of the *searching or hunting out of Sciences*. But others hold the Soul most nearly to express the Image of God, by a single simplicity of its own substance, and a ternary of its powers, to wit, of understanding, will, and memory: which similitude hath alwayes seemed to me fabulous, that the minde should be the Image of God by a singular valour or ability: For truly an Image doth involve a similitude of essence and figure, but not an equality or likeness of number onely: yea if the Soul doth in its substance represent God himself, now understanding, will, and memory, shall not be the powers, properties, or accidents of the Soul: And so the likeness of ternariness shall cease, & such an image shall badly square with the Type, whose image it is believed to be. And then it is absurd to compare the persons of the Trinity, to memory, or will; Seeing no person of the holy sacred Trinity, doth represent the will onely, or the will a separated person in God. Also the three powers in the Soul cannot any way expresse the image, or a nearer supposed thing, than a naked threeness of accidents collected into the substance of the Soul: In which sense, the Soul doth lesse denote the Image of God, than any peece of Wood: To wit, because it by its resolution, doth expresse Salt, Sulphur, and Liquor, but not (like the minde, in the aforesaid similitude of its own powers, and the divine persons) three powers onely, or a naked ternary: For every Wood hath three substances concluded under a unity of the composed Body, separated indeed in the things supposed, which in their connexion, do make one onely substance of Wood.

But *Taulerius* severeth the Soul or minde, not indeed into three powers, but into two distinct parts: To wit, the inferiour or more outward, which by a peculiar name, he calls the Soul; and the other the superiour, the more inward, and the which he calls the bottom of the Soul or Spirit: In which part alone, he saith, the Image of God is specially contained: unto which there is not access for the Devil, because there is the Kingdom of God. But to either part, he assigneth far unlike acts and properties, whereby he distinguisheth both from each other. But at least, that holy man, doth blot out the simple homogeneity or sameliness of kinde of the Soul, whereby notwithstanding it ought especially to express the likeness of God: or at least, he thus far denies the Image of God to be propagated throughout the whole Soul of man. Surely I shall not easily believe a duality of the immortal Soul, or the interchangeable course of a binary or twofold thing, if it ought to shew forth in its very own essence, a unity: But rather I shall believe, that the minde is rather made like unto God in a most simple unity, by an indivisible homogeneity, of Spirit, under the co-resemblance of immortality, and undissolution, and identity without all connexion.

Therefore the glorious Image of God is not separated from the Soul, as neither to be separated; but the minde it self is the glorious Image, as well intimate to the Soul, as the Soul it self is to it self: for therefore, the likeness between the minde, and God, cannot be declared, or thought, seeing God himself is wholly incomprehensible, neither can therefore the Character of identity and unity wherein that likeness is founded, ever be thought or conceived. It is sufficient, that the minde is a Spirit, beloved of God, homogeneous, simple, immortal, created into the Image of God, one only Being, whereto death adds nothing, or takes nothing from it, which may be natural or proper to it in the essence of its simplicity.

And because from the constitution and appointment of it, it is a partaker of blessedness: therefore damnation coming upon it, is to it by accident, to wit, besides its purpose, and by reason of a future fall or defect. Therefore the minde being separated from the Body, doth no more use memory, nor the inducing of remembrance, by the beholding of place or duration: but one only thing is now unto it, and there it containeth all things.

And therefore if any memory should survive in it, it should be vain and burdensome for ever: As also remembrance or calling to minde; because it is that which is drawn forth into act by the discourse of Reason, which is now dead: And so in eternity it hath no longer place: where indeed the Soul stands out of the necessities of remembring, by the beholding and enjoying of naked truth, without declining, weariness, and defect. Likewise the Soul that is blessed should stand out of the aforesaid ternary of Powers, and therefore neither should it any longer represent the Image of God: for which things sake alone it was notwithstanding created. Yea by looking more fully into the matter, I do not finde in man being mortal, memory to be a singular, or separated power of the Soul, but a naked manner of remembrance; whereby those that are unmindful, through the aid of the Imagination (which is the Vicareffe of the Intellect) do fit or forge an Artificial memory, and far more strong than else a natural memory would be of those things.

And moreover, together with the life, the will also departs from the Soul; and therefore it seems to be accidentally, as it were added to the Soul: For God, after man was created, placed the same in the hand of his own free will: which denoteth not onely a posteriority, but also in a proper manner, that the will is not originally essential to the minde, which from a grant, was added like a Talent unto it; that man might follow the way which he had rather choose. Otherwise surely, in the whole stage of things, there is no power more destructive to man than free will, because it is that which alone brings forth all disagreement between God and man. Wherefore, such a faculty, in the blessedness of Eternity, cannot likewise have place: But a liberty of willing being taken away, the will it self also perisheth, or it shall be frustrated by torment. Therefore they say, the will is confirmed in Heaven, or rather therefore taken away: That is, in Heaven there cannot be a willing, or a willing to will, except that which God willeth: And they who are in Charity and Glory, cannot but will those things which belong to Charity: Therefore the will of man ceaseth, when the liberty of willing is melted away: And by consequence, the will is a frail power of the Soul; Because it cannot be serviceable to, or profit a blessed Soul.

While a wishing onely, neither can, nor could any more be brought into act, which is not in Heaven, where there is full satiety and possession of desirable things with all abundance. Therefore the will of a blessed Soul should be a burdensome appendice. Let it be sufficient, that there hath been a treasuring up in this life, by a power of willing.

- 27 Therefore together with life, a power of willing perisheth, and a substantial will manifesteth it self from the understanding, and Essence of the minde; not any thing distinct, and therefore having its Essence distinct from the free accident of willing: For as the power of the Imagination or phantasie, is estranged by deatages, doth deat, and perisheth with the life; So the free power of willing, ceaseth.
- 28 *Plato* his *Parmenides* at sometime understood; that there are not accidents in God, neither that there is a duality, distinct from his Essence: wherefore I conclude, if the minde ought to shew forth his Image, likewise that every property of the minde ought to dissolve together into the intellective substance of a simple light: Even so, as the smoak being kindled by the flame, is the same with the flame in figure and matter: So the Soul is a naked and pure Intellect or Understanding, and Image of the uncreated Light.
- 29 And so as the eye doth behold nothing more truly and properly than the Sun, and all other things by reason of it; So also the Soul that is blessed doth not understand any thing more truly, than the light, wherewith it is inwardly enlightened, and which it enjoyes, from whence indeed, it wholly and immediately dependeth. But as the eye doth not bear a stedfast beholding of the Sun; So the minde cannot understand God, unless according to what Charity it shall have, according to the measure whereof it also possesseth God gloriously within: For its understanding being free, it doth attain the use of the thing understood, as by removing, it transformeth it self in well-pleasing, and a study of complacency, unto a unity of the light, which pierceth the minde it self, and in piercing, makes it blessed. So indeed, the minde doth principally and primarily contemplate of God by understanding, is illustrated by way of piercing, and so the Image of God which it shewes forth, by transforming the same, doth make it like unto it self.
- 30 But they which have placed the Image of God in Reason, do argue; That the Law is the Image of God, but the Law is written in our Souls by reason; and so they think the Soul to be the Image of God, as it is rational: But they do not consider, that the Soul might so indeed contain the Image of God: but not that the minde should therefore essentially be the very Law it self: No otherwise, than the Law and the Soul do differ in the supposingness of essence: For there was not yet a Law, when the Soul of man was now created. But I, concerning the searching out of Sciences, have shewen, that it is a blasphemous thing, to have brought back the Image of God into Reason; Seeing there is no likeness of Reason, or comparing of an uncertain and frail faculty, with God. Therefore I will speak my own: For the understanding hath an intellective will, coequal, and substantially co-melted and united with it self, not indeed that which may be a power, or an accident, but the intellectual light it self, a spiritual substance, a simple essence, undivided, separated from the understanding by a supposingness of its essence, after an incomprehensible manner, and not in essence. In the minde there is likewise a third thing, which for want of a true word, I call Love, or a perpetual desire: Not indeed of having, attaining, possessing, or enjoying, but of loving or well-pleasing, equal to the two aforesaid things, equally simple in the unity of substance: which three, under the one onely and indivisible substance of the Soul, are co-melted into unity. But that love is not any act of the will; but it proceeds together from the substantial understanding and will together, as it were a distinct, and glorious act. Neither in the next place, is that love a passion; but a ruling essence, and a glorifying act.
- 32 Therefore the will and love of this place, hath nothing common with the will of man, or flesh: because they are essential Titles, whereby for want of words, the minde doth after a certain sort, represent the Image of God: Because the Intellect doth understand, is intent upon God, and doth love him with all the minde, with an undivided act of love, and one onely act of complacency or desire, in the every way simplicity of it self: But these two intellectual things, to wit, will and love, were together with the understanding from the beginning of Creation: neither must we think, that the same are stirred up anew after death; seeing they are of the essence of the minde, or of the Image of God: But as soon as the disturbed understanding gave place to the sensitive Imagination; so also the will, and love that were intellectual things, have through corruption of nature, admitted of a will, and memory, which together with the mortal Soul, depart into nothing, the integrity of the minde remaining: For in an extasie, the understanding, will, and memory do oft-times sleep, the fiery act of love alone surviving, but so distinguished from those three, that notwithstanding, it is not without the understanding and will which are substantial, and also suited to it self.
- 33 Therefore love, the other being as it were laid asleep, stands in the superficies or upper part, as long as it shall sup up the other into it self: But in this life, love is before desire, because it is a passion of the amative or loving faculty, which proceeds from that suppositionality

ality of the minde, which is substantial love, and resembles the Image of a corporeal faculty, in this life; and therefore, all things do inclinably or readily rush into disorder, and into dissolution: But in the heavenly Wights, that love doth neither constitute a priority, as neither a distinction from desire, neither hath it the nature of a power, as neither is it a habit, or act of willing, neither doth it subsist out of the understanding.

Therefore the Intellect or understanding is a formal light, & the very substance it self of the Soul, which beholdingly knoweth without the help of eyes, even as also it discerneth, willeth, loveth, and desireth without eyes, in its own unity, whatsoever it comprehendeth in it self, and sheweth by willing: For neither doth it then any longer remember by a repetition of particular kindes, of a thing once known in an image or likeness; neither is it induced, any longer to know by circumstances: But there is one onely knowing at once, of all things understood, and a beholding Aspect of them within it self; yet so, as that it may know one thing more personally than another, while the understanding doth reflect it self upon the things understood in a distinct oneness of truth; no otherwise than as now in the artificial memory, where that remembrative memory is not a distinct act from the inductive or brought-in judgement of the understanding. Therefore that is a thing more proper to the minde, being now once dispatched from the imaginary turbulences of understanding.

For neither doth it hinder these things, that in living persons the memory decayeth or perisheth, the judgement being safe, or on the contrary: For the faculties of the sensitive Soul are of a diversity of kinde, distinct in the Body, because they are conceived by the mortal Soul, after the manner of the receiver.

Even as also unto Inanimate things, I observe a certain deaf knowledge of the object, likewise a feeling, and affection of the object, to belong: And the which have therefore begun to be called Sympathetical things or things of a like passion or affection: which deaf perceivance of objects, is to them like sight and understanding: For there is besides, in those (for whatsoever things do the farther depart from the simplicity of the minde, for that very cause they are more ready for multiplicities of offices) a certain vital virtue, and natural endowment, of a certain goodness, ability, and efficacy, for ends ordained by the Creator: Even as there is also a third power, resulting from both the foregoing ones, which is for rejoycing at the meeting of things helpful or delightful, or of turning away from things hurtful: wherein is beheld a certain affection toward things abjected or cast off, and likewise fear, flight, &c. which threefold degree, is as yet more manifest in the more stupid Insects, and in outrageous or mad men, in whom no understanding is chief, and onely a power of a visual light the governes, doth shine forth: yet in these moreover, there is an act of vital virtues and functions present, by reason whereof they do subsist: And thirdly, there is in them a far more clear act of rejoycing and turning away or aversness; which things are yet far more powerfully declared in other sensitive Creatures: To whom indeed belongeth a certain sensitive imagination, with a certain kinde of discourse of Reason, shining forth in them instead of understanding, more or lesse in every one. So that wittiness or quick-sightedness, will, memory, do happen unto them under the apprehension of understanding; Yet the objects, and offices or functions being continually changed, according to the matter that is apt for divisions and singularities: which matter doth therefore indeed accuse the diversities of receivers: Also in these, there is an issuing power of goodness and virtues, whereby Souls do more or lesse favourably incline into the exercises of their own virtues, or cruelties: And at length there is also in them their own complacency or well-pleasing, weariness, and animosity or angry heart, for the considerations of objects; so co-united to sensitive Souls, that it is scarce possible to behold two persons, but we are presently addicted to one more than to another: And these being incorporeal things, after the manner of the receiver, shall for that cause, in man, be more clarified:

Finally, I will not therefore have the Image of God to be considered for any ternary of faculties, which doth thus far belong to other things in the Systeme or frame of the World: because the Dignity of the Image of God; is not any way participated of by other created things: For truly the Image of God is intimate onely with the minde, and is as proper to it, as its very own essence is unto it self: But the other properties are not the very essence of the minde; but the products and following effects of essences: because it is not becomming the Majesty of the Divine Image, to be drawn out of qualities. For the properties of other things do co-melt into the essence of the Soul, by virtue of the Divine Image: But if they are reckoned as it were attributes, or products; that is by reason of a miserable common manner of understanding, and an accustomed abuse thereof.

38 For truly, the minde is one pure, simple, formal, homogeneous, undivided, and immortal act, wherein the incomprehensible Image of God doth immediately, incomprehensibly, and essentially consist and forme the minde; So that in that Image, even all the powers do not onely lay aside the nature of attributes, but also do collect their own suppositionalities into an undistinguished oneness: Because the Soul is in it self a certain substantial light, or a substance so clear, that it is not distinguished by things supposed, from the very light it self; and its understanding is so the light of the minde, that the minde it self is a meer clear or light-som understanding: For in this its very own light, the minde being separated from the Body, seeth and understandeth it self, wholly throughout the whole: to which end there is neither need of a brain nor heart:

39 To wit, in which Organs or Instruments, the substance of the minde doth seem onely to assume the race of properties. Surely, while the abstracted understanding it self doth make use of corporeal Instruments in the Body, unto which it is bound, and as by its Seat of the sensitive Soul, it is drowned in the depth of the corrupt nature thereof, it representeth and assumeth a qualitative faculty, which is called *Imagination*:

40 The which, from the Society of the imaginary power, the Splendor of the sensitive Soul and understanding it self being degenerated in the Organs, doth rise up by a certain combination, into the aforesaid qualitative power: Therefore that faculty is wearied by imagining, faileth or waxeth feeble, also it oft-times becomes mad, and by imagining, the hairs wax white or grey: But the minde being once separated, is never tired in understanding. Moreover the Imagination in living persons, is not onely wearied; but also it hath not from it self intellectual representations, which it hath not drawn from sensible objects: And therefore the intellectual power which concurrerth with the imaginary office of the sensitive Soul, doth follow the disposition of the Organ, and the will of the sensitive life, no otherwise than as elsewhere in natural things, the effect doth follow the weaker part of its own causes.

41 But whatsoever the Soul doth require to know and will, for once, or for oftner times; that it hath wholly from it self, and not from a stranger without: For the good substantial will of a blessed Soul, doth not arise from the thing understood; but it is its own goodness of love, by which the blessed minde is substantially, and not qualitatively good.

42 Which Prerogative it hath, because it is the typical Image of the Divinity. But Bodies do slide by a perpetual free accord, into the attributes of Forms, their diversity of kinde, successive changes and dissolutions. Therefore the love or desire of the minde, is not the office of an appetitive power; but the minde it self is intellectual, and willing: which things are undivideably coupled under unity, in as great a sameliness and simplicity as may be: yet in mortalls they are separated as well by reason of the necessity of Organs, unlikenesses of Functions, as the mixture of the sensitive Soul.

44 For truly, now we often desire those things which the understanding judgeth not to be desired, and the will could wish not to come to passe: But it must needs be, that things whose operations are different, the same things should be distinct in the Root of their own essence, after the manner whereby all particular things are separated: In the minde indeed, by a relative supposings only; but in the sensitive Soul, according to a corporeal and qualitative nature. And therefore that amorous or loving desire of the mind, is the substance of the Soul. And although in Heaven there be a full satiety of desirable things, and a perpetual enjoyment of them; yet the desire of the minde which is a study of complacency, doth not therefore cease, neither doth this bring a passion on the minde, any more than Charity it self; Because they are those things which in the Root are one and the same: otherwise, the aforesaid desire ceasing, a satiety or full satisfaction should cease, or an unsensibleness of fruition or enjoyment should even presently arise in Heavenly Wights.

46 Therefore that desire or love is the fewel of an unterminable or endless delight: Therefore it is manifest, that understanding, will, and love, are things substantially co-united in the minde: But in the sensitive Soul, that operations are distinguished, from the Root of divers faculties, while we understand things that are not desired, we also desire things we would not, nor do plainly know: Lastly, we will (while any one inclines to punishment) those things which we do not desire, but we would not have it so: From whence it happens, that desire doth overcome the will, and likewise the will doth compel the desire, and so that there are mutual and fighting Commands: All which things do happen in mortal men, as long as the sensitive Soul doth draw its own powers into a manifold disorder of division: So, impossible things are foolishly desired, things past, likewise things present, are desired, or wished not to have happened.

47 But the desire whereof I speak, laying hid in the minde, unless it were of the essence of the minde, he that hath seen a Woman to lust after her, should not sin before a consent of the will;

will: Therefore we now desire by the faculties of the minde, emulous or striving in the sensitive Soul, the effects whereof are refused by the will and judgement: Also in the manner; for now the desire or love worketh one way, and the will another. Likewise in the motion of the day, or in duration, desire goes before, or followes willing, and one thing successively overcomes another, that it may restrain any thing distinct from it self, and that wholly in mortal Creatures; because it is from the animosity of the sensitive Soul.

But in those that are in Heaven, that love riseth again, as it were the substance of the minde: for there, nothing is desired which is not willed: And that is collected into a oneness, as well in respect of act, as substance; Although they have their suppositions in the Root, diverse: which doth plainly exceed the manner of understanding in mortals: Because, indeed the Kingdom of God is now in man, but after an incomprehensible manner: but after death, the same Kingdom collecteth all things into its own unity: Therefore the chief or primary Image of God is in the minde, whose very essence it self is the veriest Image it self of God: which Image or likeness can in this life be neither thought with the heart, nor expressed by words, because it shewes forth the Similitude of God, without which, there is no other image in us which may be offered to our conception: For therefore the very minde is also wholly unknown to it self. And then, in the husk of the minde, or in the sensitive and vital form, there is the same Image shining back in the powers, according to the manner of the receiver; because it is over-shadowed by a brutal generation, being frail and defiled through impurity: At length, the Body hath not borrowed so much the essential Image of the Light of God, but the figure onely.

But the miserable minde being devolved into utter darkness from the uncreated Light, whereby it hath separated it self, hath so lost the native light of the Image, by reason of appropriation, as if it were proper unto it from a due behoof; whereby it afterwards understandeth, willeth, or loveth nothing besides it self, and for it self: And therefore in rising again, it shall not represent the Image of God that is strangled or stifled in it, unless in a corporeal manner of Adamical propagation, that is, in manner of a figure: Wherefore it also afterwards understandeth, willeth, loveth all things by a blinde apprehension, alwayes addicted unto it: For it hath known its own immortality, as it feels or perceives its damnation, and it complains that that is done to it as an injustice: Because the love of it self is onely to excuse its excuses in sins, as it were committed in the dayes of ignorance and innocency, with much frailty, layings in wait of enemies, and a want of sufficient grace: neither that an eternal punishment is deservedly due for a momentary transgression: Therefore it is mad, and hateth God, especially because it knoweth the Arrest of the losse to be unchangeable, and a liberty of escaping to be prevented for ever: Therefore its hope being cut off, it passeth into a small and enduring desperation, from the very beginning of its entrance, unto a place, where there is no piety, compassion, consolation, or revoking. And because the understanding doth naturally transform it self into the Idea of the thing understood (which was known to the Heathens, and deciphered by the figure of *Protheus*) that is, into the similitude of evil Spirits its objects: From hence there is alwayes within a present hatred of God, and of the Blessed, desperation, cursing, damnation, and the ^{severall} torments of infernal Spirits. The Almighty vouchsafe out of his own goodness, to break the Snares extended in the way for us by hellish hatred. Amen. Let these things suffice concerning the Soul, for the natural knowledge of its own self. Now therefore I enter unto Nature, that I may make manifest the Seat of the Soul in the Body.

CHAP. XXXVI.

A mad or foolish Idea.

1. A doubt of the Authour about mortal poysons. 2. The ignorance of the Authour from the Idea unknown. 3. A very powerful force of those Ideas. 4. Ignorance is the guide of Physitians. 5. Another Ignorance. 6. The doubting of the Authour. 7. The confession and acknowledgement of the same. 8. A Prayer of the Authour. 9. The existence of the minde in us. 10. The floating of the Authour. 11. A History of the Authour about the examination of poysons. 12. What hath incited the Authour hereunto. 13. What he hath learned from thence. 14. That the understanding is of the Essence of the Soul. 15. That our will and memory dwells in the frail life, and why love is required from the whole. 16. How the understanding shakes its Beams into the Head. 17. A distinction of some Lights. 18. A certain act of feeling of the Powers of the Duumvirate, and the proper manner of the Soul in its own state of Lights. 19. A difference of Knowledges in respect of place. 20. A clearing up of Remedies for the Head. 21. What the Schools do well teach concerning these Remedies, and what defectively. 22. There is a diversity of understanding in the state of innocency, and now. 23. The difficulties of the Authour. 24. The knowledge of the faculties of the minde is far different from that of any other whatsoever. 25. The difficulty of searching for madness, and the manner proposed by the Authour. 26. A co-knitting of the minde with the sensitive Soul. 27. Why the minde is not in the heart, as neither in the Head. 28. A convincing Argument proveth that it is in the Duumvirate. 29. The glory of divine compassion doth shine forth in our griefs or weakneses. 30. The first degree of madness. 31. The second is in a drowsie sickness. 32. The inward obstacles of the sensitive Soul. 33. The memory doth first fail. 34. The following arrivals or comming of defects. 35. The conceits as well of a sound man, as of a mad ^{repar} are made with Ideas. 36. Some mad Ideas are alwayes, and every ^{acce} where equal, others not. 37. The implanted Spirit of the Midriffs being hurt, madnesses do remain for life. 38. Things worthy to be noted. 39. The Confessions of mad men, being cured. 40. What conceptual Ideas may do for a mad man. 41. Eccentric and poysonous Ideas, wherein they may co-agree. 42. The power in a mad man which overcometh Colds. 43. The immortality of the minde is proved from hence. 44. Whence the Treatise concerning madness may be derived. 45. An extinguishing of a mad Idea is intended. 46. The manner of extinguishing the allied blot, and a double manner against madness. 47. Some Histories of the thing done. 48. The Remedy of a Hydrophobia or a Disease causing a fear of water, and of the biting of a mad Dog before a Hydrophobia. 49. A repeated History of a mad man. 50. Considerations of plungings under water. 51. A ridiculous thing in an added Remedy of Galen. 52. A miraculous curing of madness.

Concerning the action of Government, and likewise concerning the *Duvmvirate* or Sheriff-dom in office, even as becometh a natural Philosopher, I have written; that I might discover the Seat of the phansie or imagination, and might describe the strife about the Inn or Seat of the faculties of the minde. Notwithstanding, I being long since in doubt, knew not, after what manner an understanding man might degenerate into a mad man. I knew indeed, that in sordid and poysonous things, there were certain natural endowed powers, not indeed understanding ones; but those which might answer in affinity to those: So as that they might seduce our understanding against our wills into their own obediences; as the biting of a mad Dog, the stroke of the *Tarantula*, the eating of Night-shade, &c.

For I thought that in Feverish filths, their own co-like faculties did inhabit: wherein the chance presently troubled me: To wit, because in the same Fever, cruel raging madneses had succeeded ridiculous ones: I from thence perswading my self, that in the agreement of madnes there were not disagreeing effects: For neither at the first view, did I sufficiently heed, that poysons do wax mild, or are exasperated by ripening.

And then, I looked back on a Lunacisme, because it did invade, and go back, together with its own conjunction of a Star, without all Society of poyson: Also that madnes did return, and was silent, without any vice of the life running between.

I wholly doubted, being ignorant as yet, that besides corporal poysons, there were also poysonous images, impressions, the most absolute and most efficacious Mistresses of the vital Spirits, the which, our intellectual Powers do as willingly as readily obey, as long as we are enclosed in the prison of our Body.

In the mean time, I have known by Faith, that the minde is immortal, and that by the same right, its own understanding doth remain unpolluted by the contagions of the Body; because it was not meet, that that which was immortal and infinite or without end, should be diminished or hurt by frail or mortal things. On the one side, therefore, I did willingly confess humbly my own ignorance; but on the other side, I did contemplate on the miserable, and never narrowly searched into condition of a mad man, and the so scanty Remedies in the greatest evils, and those mostly to be pitied: Because Physicians deceiving the World by a vain Doctorship, did perswade it, that they had thorowly viewed all things, neither that there was a Medicine for so great an evil; because the Brain had equally put on an unequal distemper, as it were a Garment: yet they being asked, which was the primary distemper of the qualities, could not hitherto express it by a suitable Etymology. Wherefore the barren whisperings of the Schools being despised, after that I had taken notice, that hypochondrial madneses were without controversie, belonging to the *Midriffe*; I at first began to doubt, whether that cursed poyson should be brought unto the Brain, through certain singular or particular Arteries?

But at least, that suspicion presently displeased me; because every one should labour with an unexcusable madnes; unless perhapt in wise men, those Channels should remain perpetually stopped, and so they should be diseased persons, that they might not become such. Likewise I have noted a difference between feverish doatages, and madnes; because this indeed might very often remain safe for a long time, without a lavishment of the health; also in late Nephews, without the discommodities of the seed, and life. Indeed I often left off the matter, then to me unsearchable; and I oftentimes from compassion, took it up again: And at length I saw clearly, that I was supported by false principles, that I was led aside by the credulity and authorities of the Heathens, and deluded by the unknown qualities of Diseases: And that thing I thus at first conceived, and by degrees, being more and more confirmed, I stript my self of the Doctrine which I had supped up in the Schools, concerning the Soul, and concerning Diseases: And then, from the search of the functions of the understanding, I committed my minde in rest, and poverty, unto the Lord, that he might perform what should be his good pleasure concerning me: yet I was not so indifferent, but that I alwayes had a desire to profit my neighbour.

Therefore I begged of the Lord, that I might become known to my self, not onely, in acknowledging my own deep nothingness, morally; but that as a natural Phyloosopher, I might behold or clearly view the very powers of the minde: For truly I did suppose nothing was alike pleasing, or profitable, after the wisdom of Divine things, as once to behold my Soul as the Image of God.

Wherefore I revolved the question concerning the Seat, or Marriage-Bed of the immortal Soul, and therefore I diligently enquired with my self, whether it were so wholly in the whole Body, that without a dependance on the Bride-Bed, or Central Seat, it should wander as a banished person, not being tied unto certain Cottages or mansions? and it being wholly

so in the finger, that this being cut off, the whole should depart from the whole, or through a hastening or speedy chance of fear, it should return inwards : Therefore I found the soul to be homogeneal or one and the same in kind, simple, and not to be divided ; else, neither could it be immortal. And then I knew, that its whole did shine only radially on the ignoble parts, after the manner of the light of the Sun, which should in the mean time as it were lurk in its Throne or Seat, and from thence should shine throughout the whole body, being altogether unknown to the sensitive soul, whose life nevertheless, the mind it self should be : Verily, even as the God of all, is intimately present with every one of us, yet is he naturally unknown, nor felt or perceived by us.

- 10 And then a debate arose in my mind, whether there were many centers, and those divided according to the vital necessities of the radicall bowels. But at length I knew that the mind was more tied up to one bowel than to another, as well in respect of the offices of seeing, as of understanding. And at length therefore I was reduced unto the individual bride-bed of one bowel. And while I enquired into the head, and heart, and weighed the doubtfulnesses of Authours, I presently for certainty found, that I (which I formerly until now detested) should depart into the precepts of the Heathens, who, as they were denied the knowledge of the true God, so also the knowledge of the divine image, which nevertheless is the object of healing. Therefore I being destitute of authorities and companions, knew not whence I might
- 11 begin the judgment of so great an heap : untill at length, God permitting it, I being destitute of humane help and endeavour, under many years diligent search, and hope of knowing the bride-bed of the soul, an unwonted chance befel me, the history whereof I will declare : For I was diligently heedful about the poysons of Vegetables, believing, that the poysons of so great moment were not hurtful to *Adam* before sin ; Seeing the Almighty created neither death, nor a medicine of destruction, and so to have sent forth such cruel things, nor indeed that they might kill man ; but because he was constrained in the sweat of his face to eat his bread, to which diseases he was made subject also in sweats, that he should extract Medicines for Diseases.
- 12 And therefore I did promise to my self, that that poyson after the manner of a Keeper, and a huske, did cover some notable and Virgin-Power, created for great uses, and the which might by Art, and Sweats allay poysons, and cause them to vanish. Wherefore I began divers wayes, to stir or work upon Wolfs-bane : And once, when I had rudely prepared the Root thereof, I tasted it in the top of my tongue : For although I had swallowed down nothing, and had spit out much spittle, yet I presently after, felt my skull to be as it were tied without fide with a girdle. Then at length some busineses of my Family unadvisedly befell me, I cast up a certain account, wandered about the house, and finished all things according to what was requisite. At length this befel me (which never at another time) that I felt that I did understand, conceive, savour, or imagine nothing in the head, according to my accustomed manner at other times ; but I perceived (with admiration) manifestly, clearly, discursively, and constantly, that that whole office was executed in the Midriffs, and displayed about the mouth of the Stomach, and I felt that thing so sensibly and clearly, yea, I attentively noted, that although I also felt sense and motion to be safely dispensed from the head into the whole body, yet that the whole faculty of discourses was remarkably and sensibly in the Midriffs, with an excluding of the head, as if the mind did at that time, in the same place meditate of its own counsels. Therefore I being full of the admiration and amazement of that unwonted percivance, I noted with my self, my own notions, and began the examination of the same, and of my own self after a more precise manner : And I plentifully found and sifted out, that I did far more clearly understand and meditate all that space of time : And so that, that sense whereby I did perceive that I understood and imagined in the Midriffs, and not in the Head, cannot by any words be expressed. And there was a certain joy in that intellectual cleernesse ; for it was not a thing of a small time of continuance, nor happened to me while I slept or dreamed, or being otherwise diseased ; but fasting, and in good health : Yea, although I before had had experience of some extasies, yet I took notice, that those have nothing common with this discourse and sense of the Midriff-understanding, which excludeth all co-operation of the Head : Because that I discerned with a sensible reflexion (as before I had been forewarned) the Head altogether to keep Holiday in respect of the imagination ; because I did wonder, that the imagination should be celebrated out of the Brain, in the Midriffs, with a sensible pleasantness of operation. In the meane time, I sometimes in that Joy, being in doubt, feared least the unwonted chance should lead to madnesse ; because it had begun from poyson : but the preparing of the poyson, and only a somewhat light or gentle tasting of the same, did insinuate another thing. In the mean time, although the joyous unthought-of cleernesse or illumination of my understanding did render that manner of understanding suspected,

pected, yet a most free resigning of my self into the Will of God, restored me into my former rest. At length, after about two hours space, a certain gentle giddinesse of my head twice repeated, invaded me; For from the former, I perceived the faculty of understanding to have returned; and from the other I felt my self to understand after my wonted manner. And then, although I afterwards divers times tasted of the same Wolfs-bane, yet no such thing ever happened unto me any more. But I from thenceforth perfectly learned many things.

And first indeed, that as by extacies, certain flourishes of the soul do cleerly appear; so by the afore said Rule of knowing, it appeareth that our understanding, as long as we are tied to the Body, is originally formed in the Duumvirate or Sheriffdome. 13

Secondly, And that thing is by so much the more unthought of, because the ordinary framing of discourses is about the mouth of the Stomach, but not in any Bowel, but as it were in the Membrane or Filme of the Stomach, as if in an undividable place. Nor much otherwise doth there inhabite in the Membrane of the Womb, a certain Monarchy of the whole; yet so, that a wound of the Stomach doth presently import life; but a wound of the Womb not so.

Thirdly, That for about two hours, I did perceive after an unlooked-for manner, nothing to be acted in the head; and after an undeclarable manner, the whole Soul most cleerly to meditate in the Midriffis.

Fourthly, That the like thing doth almost happen in the prayer of silence, and more and more manifestly in an extasie.

Fifthly, And that therefore the intellectuall Soul is centrally entertained in the same place.

Sixthly, Then also, that as madnesse is a defect of the understanding, so therefore that it is stirred up from the part about the short Ribs: Seeing the same faculty, which in health performs a healthy function, suffereth under diseases; a defect of the same; to wit, as oft as the understanding is ecclipsed in its own fear.

Seventhly, I have also certainly found, that the power of willing doth inhabite in the heart, 14 for from the heart proceed murders, adulteries, &c.

Eighthly, That the memory sits in the Brain, there imprinted by the soul; and that therefore it is in comparision of the other faculties, most easily hurt by a disease and old age: Yea, if any one doth labour that he may remember a thing forgotten, he sensibly perceiveth this his labour in the fore-part of his head.

Ninthly, Again, seeing the will and memory differ, are at a far distance from the seat of the soul, or understanding; I have concluded with my self, that the understanding is of the Essence of the soul, and unseperable; but the will and memory, as they are possessed in the frail life, to be frail faculties, and of the sensitive life. 15

Tenthly, To wit, that sins are made in the heart and will, in the flesh of sin, in the will of the flesh and of man: Therefore that love is required wholly from the whole mind, which (by reason of its unseperableness) is taken for the understanding, from the whole heart or will, from the whole imaginative soul, and the powers thereof dispersed throughout the whole Body. 16

Eleventhly, I have found the understanding to cast its beams lightfomly into the head, yet by the means of a corporall connexion through an Aiery spirit, which while it strikes the bowes of the Head, should bring on it a certain giddinesse and cloudy understanding: So although for sense, and fear, the spirits in that state should be plentifully diffused from the brain, yet there was likewise need of a singular light, which ascending from the midriffis, should enlighten the spirit the meane, through which it did passe; which lightsome beame is no otherwise expresseible, than that it is intellectuall and exceeding a sublunary contexture or composition: Because it is that which ought to be framed by the soul alone, which in it self is nothing but a meer understanding, or a substantiall and intellectuall Light.

Twelfthly, That because sense and motion stood free, I did think, there was another Light brought from elsewhere, or they did denote, that there was in that state a free passage of the spirits through the Nerves or Sinews: But my giddinesse did signifie that there was a certain obscurity in the head, before not perceived, and that it was dispersed in the Bowes of the brain, by a new light shining from beneath. 17

Thirteenthly, That the Liver should be of a due strength, or prosper well, also the heart of the Spirit should unceasantly blow out into the Brain, and likewise the required will of acting should persist indeed; but the intellectual Powers onely, being stupified in the Brain, should as it were sleep, if they should not be enlightened by the Midriffis. But this light pierceth the whole Body, which way it casts its Beams: Even so as the light of a Candle doth ruddily shine thorow the bones of the fingers in younger persons, as if the bones themselves were transparent.

Fourteenthly, That from that time, I am wont also to have more significative dreams with a more formal discourse, and a clearer than before : For the minde once as it were retaking the offices of its own Body, doth afterwards better understand : From whence also afterwards, *I attained the knowledge, how day unto day doth utter the Word, and night unto night sheweth knowledge.*

Fifteenthly, I was more assured, that then, my state was one ; but that of madness the Lethargie, Apoplexie, &c. another : For I seriously weighed my self with circumspection, whether that were the way, whereby men became foolish ; Seeing that in my full judgement, I was so void of all fear, that I did contemplate of my own matters not as mine : For I looked back on them crooked-wise or by the by, they being as it were shaken into the Head of a man of another World.

Sixteenthly, I learned also, that life, understanding, sleep, &c. are the works of a certain clear or shining light, not requiring Pipes or Channels ; Seeing the shining light pierceth the vital light : Therefore also the Soul doth retract, diffuse, and withdraw it self by a motion proper unto it, and altogether diversly in sleep, watching, contemplation, an extasie, swooning, madness, doatage, raging madness, by its own disturbances, voluntary confusions, yea and the violent impressions of some Simples : Because the minde doth embrace an entire Monarchy in spiritual things, divided in many general and particular kinds ; no lesse than Bodies themselves shall differ among themselves, so also shall lights.

Seventeenthly, At length, that the understanding being raised by invention and judgment, with a reflexion on places, on circumstances, on things past, said before, premised, and so on things absent, as absent, is made by an ultimate or the last endeavour in the Brain, through the afflux or issuing of a beam out of the Midrifts, as such an understanding doth presuppose memory : But that those things which are concerning future or abstracted things, without respect of circumstances, as if they were present, are wholly forged in the Midrifts : And for this cause, mad men do behold and prattle of all things as if they were present, as though they did talk of present things.

Eighteenthly, Therefore poysons which have a power of displacing the imagination, do not primarily affect the Brain ; but the Midrifts onely : Which thing, the History of a Lawyer, who had drunk Henbane-seed (elsewhere by me rehearsed) doth sufficiently prove : For whatsoever the Stomach doth conceive, that very thing is plainly transchanged, and doth wholly passe into another Essence, before that the least quantity doth from thence reach to the Brain, and whatsoever thereof doth come thither, is already venal blood, which hath put off all the qualities of its former condition in the entry of the first shops ; or at length, it slides out of the Stomach, and together with the drosses, is thrust out of doors.

And so no Simples, after what manner soever they are taken, are materially applied to the Brain : Therefore it is false, whatsoever the Schools do set to sale concerning pills for the Head, Pills of light, &c. For truly neither do Pills allure any thing out of the Head, neither doth the Head afford any thing which it hath not, besides snivel, which it sends unto its own Basin, and not to any other place : But if any Medicines or things do strike the Head, alter it, and profit it ; that wholly happens in regard of the Midrifts, from which there is an unshaken action of Government into the Head, even as hath been already sufficiently proved before. Indeed they have rightly taught, that giddinesses of the Head, and Coma's or sleeping evils, are stirred up by reason of a consent of the lower parts : but neither is their Grain without Chaffe : For the Schools have introduced grosse, Smoakie, and sharp vapours : And then, and that for the most part, in such distempers, they will have the Brain to be affected with the first or chief Contagion : And therefore its a blockish thing to have applied Remedies to the Head, to the mark I say, and without the Archer : To wit, because they have not known the true internal efficient cause, and its connexions, nor the accustomed manner of making Diseases, and because they have plainly neglected the action of Government, and the Conspiracies of light.

Nineteenthly, Also lastly, hence I have understood, that the immortal and untireable Soul, while it did of due right govern its own Body before sin, it understood all things intimately, optically or clearly, and that without labour, tediousnesses, and wearisomness :

Because it did understand all things that were in its power, in its own Center and unity, without the help of Organs or Instruments : But now being detained in a strange Inn, it being as it were wholly hindered, hath committed the diversities of Functions unto the sensitive Soul its Hand-maid.

In this place, I presume to give a Reason of the thoughts of others, who cannot sufficiently promise, or grieve for my own : For I have proposed to phylosophize concerning the more hidden Spring of Cogitations, and of the most abstracted ones, concerning the vices, and

and exorbitances of floating and uncertain Cogitations: yea we must pierce deeper; when as we must take aim at the powers of vitiated Cogitations themselves, and must come unto the fountainous and occasional causes of these vices. Surely it is a matter, hard, obscure, and unpassable, wherein the speculations of the Schools, the succours of Bodies do fail before the threshold, yea and of Diseases, whose causes and effects do fall under sense, or are proved by the dissections of dead Carcasses: wherein I say, the Patient or suffering imagination doth indeed enlarge it self; but the Agent or active one is hidden.

In other diligent searches, that which is vitiated is known by a knowledge of the whole; 24 but in those of the minde, the cause and manner of a violated understanding, should as yet be far more easily conceived, than of a sound one: because that a sound faculty doth more ascend unto the likeness of God; but a defectuous one doth more incline it self unto the meditations of corrupted Nature. And therefore that which is sound or entire in the faculties of the minde, is not demonstrated by a former cause: but that which is deficient, doth after some sort make it self known by a rupture of the co-knitting of causes.

Also madness is always of a most difficult learning, because it contains in it a denying, together with a privation: wherefore in the case proposed, I have judged of the same in another way; whether perhaps, by searching into the manner of making in any one kinde of 25 madnesses, I might finde an utterance for the other: Therefore I have proposed that madness which ariseth from a strong, and continued contemplation, fear, and passion: Forthwith afterwards, I concluded that the quality of the poysonous matter, was to be known, and the dispositions of Instruments which should concur, when as any Simple being taken, or something inwardly generated, had stirred up madness: But the knowledge of one sort of madness being attained, it shall be the easier to measure afterwards the diversities of the same, by descending into the amplexes of the manners or measures, strength, approaching, application, and variety of particular kinds: For therefore I first of all reckoned to search into the Seat of the Sensitive soul, to wit, the exorbitances whereof do cause madnesses.

For truly I have considered, that in what seat the animal form should abide, in the same 26 also the immortal mind should co-inhabite, as being tied unto it, which should refuse a duality, difference and diversities of mansions: For neither was it meet for that mind to be tied to the body without a mean, when as the Seed of man, no lesse then of a beast, by voluntarily flowing down, should be limited even into a living soul exclusively: And so that it was meet for the mind to be tied to a social form, and a formal Light, with which it might best agree; as in the Chapter of Forms, and the book of long life concerning the entrance of death.

Therefore I first of all decreed, that the immortal mind hath not chose a mansion for it 27 self in the heart, indeed a bowel so unquiet, and greatly extended with so many disturbances and divers offices of the body. Also, I have shewn, that the head is not a fit Inn for the immortal mind, because it was busied in governing the motion and sense, and especially because its conspiracy being stopped up from the lower parts, at one only instant, the faculties of the mind being cut off, do perish, neither do they meditate of the least matter, and therefore that it hath not in it the proper operation of the mind the Princeesse; yea rather, I have seen the ill disposed Duumvirate for the most part to disturb the head (otherwise well disposed) into madnesses: And therefore I having admired at the quiet of the Spleen, and likewise the withdrawing thereof from the government of the body, I intently considered of this convincing argument.

If the mind, the image of God, be centrally in the head, it shall be either in the bosoms, 28 or in the very substance of the brain: But not in this, because it is that which wants sense and venal blood, being destitute of commerce, whereby it may be present with the whole body, to which it is bound. Indeed it is controverted by none, that the head doth rule by sense and motion: But that is a lesse, brutal and beast-like government. But we are constrained to believe, being perfectly taught by the disorders of diseases, that the head is governed from elsewhere, in the suspensions or withholdings, and exorbitances of the mind. But that the soul is entertained in the hollow of the Brain, I have judged it unmeet that the immortal soul should have married a wandering and fluid spirit, daily arising out of the venal blood for every moment. Wherefore it desired a more stable and quiet Inn, than that which should be slideable every hour. It hath rather rested in the Center or middle of the body, in the substance of a bowel, whence it might equally commune with all the Members, by reason of the unity and continuation of the implanted Archeus. But seeing the Organs of the body, in respect of the mind, are dregs and husk, it hath chose out to it self the kernel of the body, to wit, a gentle spark, a formal light, or the sensitive soul, to wit, which the mind hath married by the command of the Lord; and what God hath joyned together, man may not separate without guilt. In the mean time, the miserable state of mortals is to be lamented, to wit, that the mind is

ried to the sensitive soul; indeed to an impure Being, given to concupiscences, enticements; and pleasures, and that the immortal mind doth so easily assent to it, as if it would now sleep for ever in the carelesnesse of its own self.

- 29 But not so; for by so much is the glory of divine compassion the greater, which by its own grace alone, doth freely revive, and support out of the drowfie sleep of death, those whom he will have saved: surely else, the sensitive soul being subject to diseases and madnesse, should be alwayes prone into any kind of pleasures.
- 30 For the first degree of madnesse doth plainly appear in sleep; yet is it naturall, while with the Title of honest recreation and leisure, it sinks it self with a pleasure of rest, into its own Inn. Moreover, all drowfie sicknesses are the excentricities, vices, defects, and expresse madnesse of natural sleep; which indeed do now no longer issue from a proper liberty and pleasure of the sensitive soul; but arise from excrementitious filths, as it were feverish ones: For even as natural thirst is the feeling of lack of moysture, but feverish thirst is from the deceitful wilinesses of an excrement; So drowfie sicknesses are not made by a natural faculty, whereby the soul stirs up sleep to it self; but being seduced, or overcome by the strange impostures of impurities. Therefore sleeping evils, and likewise the Apoplexy, speechlesnesse, &c. are not so much the vices of the erring soul, as the weaknesses of the same, contracted by the Wedlock of vitiated Organs: For the companies of impurities do as soon as may be, occasionally invade the monarchicall state. Nor indeed that it is necessary that those materiall impurities do diffuse themselves into the animated or soulified light by a connexion; for it sufficeth that they have a stupefactive poysonous force, destructive to the sensitive soul; because they do alienate the imaginative faculty, even so that as of the spittle of a mad dog in the fear of water; so also the madnesse of carelesnesse is introduced by those soporiferous things; that power is in those filths potentially and feminally from the beginning, very unlike to it self, after it hath come to maturity, no otherwise than as an Acorn from an Oake. Therefore the dregs or filths do imprint a forreign Phantasie on the sensitive soul against its will, which manifestly appeareth in Opium, Henbane, &c. And which filthy heap of impurities, besieging the sensitive soul in its own original bowel, doth make the act of the understanding of the mind, drowfie, it not being able to shine freely into the sensitive soul thus besieged. Wherefore the sensitive soul being destitute of a governess, doth stir up tumultuous stornis, and lifts up its own rempest by degrees into the case of the will, whence it also becomes wrathful, and is carried after an headlong and inverted order. At length the head by a preposterous knitting or conjoyning, draws out its own images of witty or pleasant things: Whence it comes to pass, that the doatages being for the most part consumed, no remembrance of things done remaineth; because the sensitive soul being violently smitten by the besieging, hath rashly moved all things; whereas otherwise, madnesse, being void of such filths, are for the most part mindful of things done.
- 33 For I have many times certainly found, that Doaters have felt before-hand, Intellectual Images or Representations to be dismissed from beneath, to be troublesome upwards, and that they have first been weakened about the memory: and so that hence also I have gathered, that the intellective power is seated far from the head; no otherwise than as the parts remote from the heart, do first of all feel a defect of a vital bedewing.
- 34 In Doatages I have observed the memory of things once conceived, first to stagger, and then, that instead thereof, an importunate and continued remembrance of one thing hath arisen, which hath it self in manner of a repeated dream, with a most troublesome inversion or confusion, and a labour of sleep, which labour, watchings do presently follow, to wit, while the foregoing dreamie images have enfeebled the memory of the brain, then a certain waking Dream, with an expresse doatage from the Midriffis, doth enter. For, neither is the doatage made with a cessation of understanding, even as in the Apoplexy, sleepey evil, swooning, &c. But there is a confused, uncessant propagation of Idea's formed in the Midriffis, shaken like beams upward.
- 35 And seeing that in health, conceptions are not otherwise made without Idea's: in a doatage also, there must needs be its own mad Idea's: But altogether with this distinction, That Idea's or likenesses in health, are formed from a liberty of the soul; but mad ones are seal-marks brought into the sensitive Soul against our will, and therefore they doe also violently withdraw this out of its path: So far is it, that mad Idea's should be formed by the mind, which knows not how to play the fool.
- 36 For it is manifest that Idea's doe follow the disturbances of things from whence they are made; which is most clear in a mad dog, and the *Tarantula*, whose poison doth produce a proper, determined, and equal madnesse, and Idea's alwayes co-like to themselves: so also a strong disturbance of our imagination doth forge an image, and imprint it on some filths; but if

if not on the nourishment it self, yet even on the solid and constitutive part of us: whence indeed there is a continued propagation of new Idea's, and the very diversity and amplex thereof in mad folks: For truly, from fear, contention, envy, ambition, love, study, care, shame, covetousness, and other co-like disturbances, are madneses made: And so much the more miserable are those which are stirred up without the infamy of excrements, because they do either continually persevere, or do return at set periods of relapses. Otherwise, the filthinesses being consumed, the blemishes sprung from thence do voluntarily cease. But madneses, whether they do rage with a continuall heat, or do return by intervals, they at least have so defiled the spirit of the Duumvirate, that they have radically imprinted the storm of furious images received after the same manner, as a blemish branded on the Young from the exorbitancy of its mother great with child, is durable for term of life.

Indeed, even as the mark of a Cherry in the Young, doth every year wax green, yellow, and red, with the fruits of the Trees; So also maddish Idea's arising from disturbances, have in the Spirit of the midriffs, their incentive or provoking intervals of repetitions, accessses of periods, and imbitterings; or also their uncessant fewels of continuations: Which thing a Lunacisme doth clearly expresse unto us, to wit, it keeping the Conjunction of that Star. Neither verily is it a wonder, that those madneses have themselves in the Duumvirate, in manner of a blot; for the Spirit is capable of seeing in the eye, not elsewhere in the whole body. Therefore seeing the Duumvirate doth by a radical Ordination of the Lord, continually employ it self about imaginations, therefore the incidencies or chances that are brought on it, ought so to vitiate the family-Government of the Imagination, that it receives a re-planting of the relapses of the Idea conceived.

In the meane time, we must take notice that a Lunatick person could not be cured, but by the casting out also of the unclean spirit; whether this shall be a companion of the Night-star, or finally the chief effecter. I likewise in all madnesse do find a great arrogancy, in taking to it a certain unmortified sociall passion, which doth also remain for terme of life, and being transferred on modern Nephews, doth shine forth: Because the mad Idea hath pierced the implanted Spirit, whence at length it violates the Seed, being made proper or natural to it. For I have the more curiously searched into many mad men, and have cured not a few, as well those who had become mad from great disturbances, passions, and other diseases, as those that so became, from things taken into the body; and they have told me, that they fell by degrees into madnesse, which was wont with a foregoing sense to ascend in them from about their short ribs or midriffs, as it were an obscure Phantasmie and cloudy temptation of madness, wherewith at first they were pressed as it were against their will, untill the Idea at length, had gotten a full dominion over them: But being returned to themselves they were mindfull of all things acted; for they boldly or confidently complained of all things, to wit, that at first they were spoyled of all consequence of discourse, and that they remained in the punctual plunging of one conceipt (without which they thought of no other thing) with grief, trouble, and importunity: For they thought no otherwise, than as if they had alwayes beheld that conceipt in a glasse; yea, neither did they know, that they did then think that, or so behold it in their own conception: Although they did so stedfastly think, that if at length they should happen, a little before the entrance and dominion of madnesse, to stand, they had stood for some dayes, without weariness, neither should they know that they did stand. For it thus befell them, that that Idea of foolishness which had driven away discourse (by which else they had been eased from their immoderate and inordinate weighing or examining) was imprinted with a dominion over the Spirit, the Lieutenant to the understanding: Yea, that which these persons had made in themselves by a long delay, & continued cogitation, was attained by others, by a sudden and violent disturbance, in a short time of delay. In the mean space, some complained, that while it was a working, they were oppressed with an unwilling and importunate Troop of thoughts, as it were a Smoak being stirred up from beneath, the which if they would suppress by discourse, yet a repeating of the same conceipts alike troublesome and importunate, returned. But others, who had not power over themselves, or were otherwise without comfort, presently after they were diverted from a strong and fixed contemplation, as oft as they would sleep, or were otherwise at leisure, they returned with a plausibility into their forbidden or hindred speculation, yet altogether troublesome: therefore rejoycing in solitarinesse, they withdrew themselves from the talks of others.

Because conceived Idea's as yet wanting a body, have and hold themselves in respect or manner of an intellectual light, and therefore they do pierce the first constitutives of us, which is not likewise lawfull for meats and other bodies to do. Therefore they do pierce and cloath themselves with the airy body of Spirits, and by means hereof do infect the vital Forms of the parts.

Yet

Yet with this difference, that *Idea's*, which were forged by the excentricity of conceits, did indeed enter, and were admitted more powerfully; but were imprinted more slowly: whereas otherwise, poysons that cause madness, a disease mediating, did by degrees sow their own ferment on their proper objects: but at length they did stubbornly imprint it on them, as it were sealed on nature.

42 And it is a thing proper to mad folks, that however naked he doth lay on the ground, or doth lodge all night in marble, in the sharpest blowing of the North wind, he shall not be frozen, or his joynts die together with himself: whence it is not sufficient to have said, *A mad man feels not cold, nor knowes that he is cold*: For truly a depriving, or denying of knowledge or sense, affords no real thing, and much lesse doth it make hot, or take away the forces from the cold, that therefore it should cease to freeze the flesh: For although a child in the Cradle doth not fear the plague, nor knowes that it is present, the plague hath not therefore lost its right over him. Therefore there is some kind of power which overcomes Colds, neither doth it submit to a sublunary tempest.

43 And hence it is chiefly manifest, that the mind in us is immortal, and not capable of suffering: Indeed the mind it self marking, that the sensitive soul doth not govern man according to the requirance of our Species, doth as it were out of compassion toward a guiltlesse blindness, by its own virtue, wherein it is superiour to the Elements, issue forth an unsensible beam, which deprives the body of a mad man, of the mortal importunity of cold.

44 Furthermore, seeing all madness doth arise from a budding or flourishing, conceptual, foreign Idea implanted into anothers ground, and that all this speculation is directed unto some profitable end, and not onely to curiosity or ostentation: I have considered also, that a mad Idea, to wit, already imprinted on the radical principles of life (and so also hence to be propagated into families) cannot be taken away, together with the Subject which hath cloathed

45 it: Therefore a remedy was to be found out, which might slay, kill, take away, or obliterate that aforesaid image of madness, or the blot now characterized; no otherwise than as a blemish

46 imprinted on the young, by the moving of the hand of a dead carcasle on it (which was killed by a long consumption, & stripped of every property of life, until the cold shall pierce the blemished part, which is done in the space of one *miserere*) doth for the future vanish away of its own accord. After the same manner also that the Idea of madness ought to perish, the immediate subject wherein it doth inhere, being in the mean time safe: Whether that be done, by introducing a death of the Idea, or by in-generating an Idea of equal prevalency, or one that over-powreth the foolish Idea: For from hence it comes to passe, that a remedy for madness hath been hitherto despaired of, because none hath hitherto carried up the nature and properties of madness above the distemper of the first qualities: yea, *Paracelsus* himself, otherwise injurious against heats and colds, hath enslaved madness wholly unto heat, and blood-letting, and hath therein rendered himself ridiculous. I confesse the scope of curing hath seemed difficult, because not onely the Idea of a corrupted imagination, and a sealie mark and blemish is introduced into, and imprinted on the innermost point of the understanding; but also because the restoring of the in-bred spirit is accounted plainly impossible. Indeed a wished aid of Secrets hath been implored, but the progress hereof hath been slow, because a stubborn enemy did resist within. But medicines have been administred, wherein a symbole or mark of resemblance doth inhabit, that is, the fermental imagination of a sounder judgment. For truly, as there are poisons of the mind, causing alienation for a space, or for the whole life-time, to wit, which do introduce a proper phantasie into us; as a mad dog, the *Tarantula*, &c. So also there are in Simples their own fruits, of the knowledge of good, and evil, in their first face indeed poisonous; under which notwithstanding, the more rich treasures and renewings of the faculties of the mind are kept. But seeing it is not safe to cast those remedies on common Physitians, by reason of the manifold abuse of the wits of this age:

Lastly, seeing neither is it fit or meet for every one to go to *Corinth*: therefore in another way, which is of the mortifying of foolish Images, have I thought meet in this place to proceed.

47 But some Histories have confirmed in me the consideration conceived: the which, as those that are to be imitated, I will here rehearse. There is a Castle, scituated by the Sea-side, four leagues distant from *Gandt*, which they call *Cataracta*: I saw a Ship swimming beyond it, and therein an old man naked, bound with cords, having a weight on his feet; under his arm-pits he was encompassed with a girdle, wherewith he was bound to the Sail-yard: I asked what they meant by that spectacle: One of the Marriners said, that old man was now *Hydrophobial* or had the Disease causing the fear of water, and to have been lately bitten by a mad dog: I asked, toward what part of the Sea would they carry him? did they intend his death?

death? Nay rather (saith the Marriner) he shall presently return whole: And such is the blessing of the Sea, that such a kind of madness it would presently cure: I offered them an earnest-penny, to take me along with them as a companion and witness: Therefore we had sailed about the space of an Italian mile, when as the Marriners did open a hole in the bottom, whereby the whole Ship was almost sunk even to the brim: Indeed they used that brine to recoct Spanish salt: And when as that hole was now again exactly shut, two men withdrawing the end of the Sail-yard, lifted up the top thereof, and bare the old man on high; but thence they let him down headlong into the Sea, and he was under the water about the space of a *Miserere*, whom afterwards they twice more plunged, about the space of an Angelical Salutation: But then they placed him on a smooth Vessel, with his back upwards, covered with a short cloak: I did think that he was dead, but the Marriner derided my fear: For his bonds being loosed, he began to cast up all the brine which he had breathed in, and presently revived. He was a *Cooper* of *Gandt*, who being thenceforth freed from his madness, lived safe and sound. From hence, as our soul is a Chamber-maid to find out reasons before unknown, I presently understood the Idea of the madness, and the mark of the imprinted poison, to be like as is a mortified blemish in the Young: For I knew that warts, and likewise ulcers, and foreign, future, and strange poisons lighting on the first constitution, were separable, the vital root of the Individual remaining.

Also the Marriner did relate, that the Dutch, by a raw herring salted, for three dayes space renewed, and applied to the biting of a mad dog, do take away all fear of madness. But where negligence had hindered that thing, at least, that by the beheld manner of plunging, they are all cured: For they who abhor water, its no wonder if they are cured by water. Afterwards it remained deeply imprinted in my mind, perswading my self, that that would not be unprofitable in other kind of madnesses. Therefore it happened at *Antwerp*, that a Carpenter, perswading himself, that in the night-time he had seen horrid appearances or ghosts, became wholly mad with the terror thereof: And he was sent unto the Tomb of *St. Dymphna* the Virgin, where those who are possessed by an evil spirit are wont to be freed; the matter being thereby wrested into an abuse, that all mad men should indifferently be sent thither: As if the condition of those that are possessed, and mad, were the same: The Carpenter therefore is nourished a whole year, and mad, however the wonted remedies were implored; and when as moneys were not sent from *Antwerp*, for the last half year, they sent back the mad man bound in a waggon, who, when he had loosed his bonds, he leapt out of the Wain into a deep and neighbouring pool: He being at length drawn out was laid up into the Waggon, for a dead Carcasse; but he lived for eighteen years after, free from madness. By which example, I (being raised unto an hope) knew, that not only the madness from a mad dog, but also that an inveterate or ancient *Mania* or madness might be cured: And that thing I afterwards often tried; neither hath the event deceived me, but as oft as through fear, I drew these mad persons over-hastily out of the water. I likewise learned by the example of the Carpenter, that it would be all one, whether the aforesaid plunging, or choking of the mad Idea, should happen to be in fresh water, or salt.

A certain woman, to me known, commendable for her much honesty, in the moneth *November*, in a dark evening, rushed head-long from a bridg, into a small River or Brook, with a Carr of two wheels: And when they were intent about the horse, they neglected the poor old woman, but she remained under the water, until they had unloaded the Carr of some wares: At length, being mindful of that poor old woman, they brought her to a neighbouring Village, as it were a drowned dead carcase, wherein, the wife of the Inn laid that woman on a table, with her face placed downwards, and her head hanging downwards: And it came to pass, that she thus dismissed the water drawn into the lungs. It seemed to me like a fable, until that in the mountains of *Hannonia* or *Hungarie*, a young man drowned in swimming is brought unto a noble Matron, a companion of my journey; who had the mother, bewailing the death of her son, to be of good cheer: Therefore she stretched the young man with his face placed downward upon his knees; and when the feeble young man thus hung, being altogether naked, he at length (the water being cast back) began to breath again, and revived in our sight.

Again I remember, that in the year 1606. I returning in the evening from the Castle of *Perla*, two leagues distant from *Antwerp*, found a company on the bank of the *Rotomagian* Channel, because they complained, that a young man, the only son of a rich widdow, was drowned, who was sent for, and found his dead carcase lying on the ground in the stubble or straw; she took him up into her lap, and kissed him, weeping bitterly: I bad that she should turn his body, with his head and shoulders hanging downwards, and his back upwards; and

the young man began after a quarter of an hour, to breath again. I have learned therefore, that drowned persons do not easily die, seeing both the aforesaid young men, lurked perhaps for the space of half an hour under the water: Neither must there be a cessation from prayer, as soon as he which is believed to be dead, doth cease to take breath.

- 51 *Galen*, for madness of the biting of a mad dog, before the fear of waters hath arose, gives Cray-fishes or Crabs calcined to drink, for forty dayes: Yet if that Calx be not given presently after the beginning, it profiteth nothing: and so also thus the use thereof hath remained unaccustomed. In the mean time, it is ridiculous, that in burning of Crabs, they add myrrhe, &c. or when they melt silver for to make a cup or flagon for a Perfuming-shop, that they add Triacle; The antidote whereof the devouring flame consumes, before the living creature be roasted. But *Paracelsus* affirms, that the *Hydrophobia* is cured by sharp loosening medicines; but surely the event hath not answered his promises. Therefore Catholiques despairing, nor trusting to these remedies of the Universities, our Country-men flee to *Sr. Hubbert*, where by some Rites performed, they are cured: Yet this is remarkable therein;
- 52 That if the Rites be not precisely observed, the madness which otherwise did hitherto long lay hid, doth forthwith arise, and the *Hydrophobians* are left without hope. There is a robe or gown of *S. Hubbert*, locked up in a chest with six divers keys, and also kept by six divers Key-keepers: but they do every year cut off part of that garment, the garment the while remaining always whole, for eight hundred years now, and more: Neither is it a place of juggling deceit, because it is not known at this day, whether the Robe be of fine flax, wool, hemp, or cotton; and so neither could a new one be yearly substituted in its room: But they cut off part of the garment, that they may incarnate a thread or rag thereof, within the skin of the forehead of every one that is bitten by a mad dog: For from hence there is another miracle: That he who hath once recovered by his rites, through the thread or rag taken out of the robe, may delay the time for another that is bitten, and stupifie the prevailing madness for forty dayes, and that for some years, until they to their own profit, can at length come to *Saint Hubbert*: yet with that condition, that if any one do tarry never so little above forty dayes, and hath not (as was said) before obtained by request, a prolonging of the limited time, he presently falls into a desperate madness. For the *Lombards* do thus run to the *Saints, Belline, and Donine*, and so do request preservation: And they require the healing to be from a madness arising from a deed done: But for foolish madness or being out of ones mind, they do not hitherto (as I know of) invoke any heavenly Patron.

CHAP. XXXVII.

The Seat of the Soul.

1. The matter is as yet before the Judge. 2. A third opinion. 3. The head being dead, a certain Bride hath over-lived for eight hours at least. 4. The mouth of the Stomach being smitten, hath brought a sudden and total death. 5. A Paradox of the Authour concerning the Seat of the Soul. 6. The Creation teacheth this seat. 7. Physitians do occultly consent to those very things unwittingly. 8. The Lord confirmeth the Paradox of the Authour. 9. Some reasons. 10. Against the existence of the Vegetative Soul. 11. The Heart is a servant to the Stomach. 12. The seat remains fixt. 13. That the first powers of conceptions are felt in the mouth of the Stomach. 14. They unwillingly place the faculty of concupiscence in the Stomach and Liver. 15. Whither this speculation tends. 16. They have also against their wills assented to the Paradox of the Authour. 17. The seat of the mind is the same with that of the sensitive soul. 18. The manner of existing in its seat. 19. A piercing of Souls. 20. What the sensitive soul is. 21. A similitude of its existence. 22. Heat is not the fountain of the light of life, but the light of the Archeal life, or product. 23. What the mind is. 24. By the coming of the sensitive soul, death hath entred. 25. A comparison of the dignity lost, and obtained. 26. The Spleen, for the Duumvirate. 27. The dignities of offices. 28. All foolish madneses do from hence take their beginning. 29. A remarkable thing touching the examination of remedies, a further progresse being denied. 30. How immortality did stand. 31. A change of the State. 32. A Corollary of what hath been said. 33. The error of the Schools.

THE Sur-name of a Duumvirate, or Sheriff-dome may astonish the Reader with the terrour of novelty: wherefore I am first to render a reason of its Etymologie, and afterwards I shall explain its government. Before all things the seat of the mind is to be searched into: For although the soul be every where, where the life of it is; yet as the Sun is not properly but in his own place, in heaven, although the light thereof be wheresoever he casts his aspect: There is altogether the same judgment concerning the central place of the Soul: But there is a strife about the center, or place of exercise of the soul in the body: And the Standard-defenders, being as it were hung up in the air, do encounter over this thing, not having a foundation where to fix their foot. For *Plato* contends for the Heart, for whom the Holy Scriptures seem to vore, while they teach, that out of the Heart proceed Murders, Adulteries, &c. But Physitians do respect the Head, as it were the Inn of discourse and understanding; especially because the heart, by such an unwearied motion of a stirred pulse, cannot but make the soul to be troubled and unquiet. Those that baptize do follow the opinion of Physitians.

Neither are there those wanting in the mean time, who determine the immortal mind to be so every where, and equally in the body, that they will have it to abide in no certain seat, no more than it can be tied or bound by the body: And so they suppose the soul to be a wandering, roving inhabitant of an uncertain cottage, and to be every way dispersed where life is present: But they do not regard, that some parts are cut off, the life remaining safe; but that others being lightly smitten, do presently bring death on the whole body: Some one oftentimes, by his mangled face, and head as it were diminished, testifies death to be present with him, whose heart notwithstanding, by its lukewarmth and pulse, doth promise the soul to be as yet present: And that thing is daily seen in those that do long play the Champion.

A certain Bride, being willing to celebrate her marriage in *Opdorp* nigh *Scalds*; because the Governour of the place was there, is saluted by her retainers with the noyse of Guns: But one of them dischargeth a Gun laden with a Ledden Bullet, but it pierceth the Coach, and the Temples of the Bride: She presently falls down, and is reckoned a dead Woman: But *Opdorp* is seven Leagues distant from *Vilvoord*, whither when she was brought, proceeding to *Bruxels*, her Head was a dead Carcase, cut in thin pieces, and plainly cold; yet nigh her heart, I noted a luke-warmth and pulse. Likewise a certain Image fell from a high place, on the Crown of a Woman, so as that the whole top of the Scull had depressed the Brain, almost two fingers in breadth: She was reckoned to have been dead, yet there was a slender pulle in both Arms, six houres after, and it was noted by many.

4 A certain studious man, being strong, strikes another sitting at the Table, with his fist, about the orifice of the Stomach, who presently fell down with a foaming mouth, and being lifted up by us into his Seat, he was forthwith deprived of Pulse, and before Grace was read, his whole Body was cold as Ice: A Carter being thrust thorow about the mouth of the Stomach, with a Dagger, with a foaming mouth, presently dieth; he is also deprived of all Pulse, and heat.

5 Therefore under a humble Censure of the Church, I will declare another Paradox. Although life be a token of the Soul, and this life be every where; yet, as by the cutting of a finger, or foot, the Soul doth not fly away, nor the life of the whole Body; neither yet can the Soul or life be divided into parts, that the Soul in its whole integral part may be any way dividable, and that death seemes to be near, through the hurting of a more noble member: In the mean time, it is certain, that the life in the member cut off, doth presently perish, although a part of the Soul be not therefore taken away from the whole Body: Therefore it is manifest from thence, that the Soul doth not sit centrally in whatsoever part there is an operation and presence of life: And it must needs be, that the Seat of the Soul is in some place, as it were its proper and central mansion: For from thence it dismisseth its lightsome and vital Beames, by the Archeus the Instrument of the vital light: Because the Soul it self is a certain light, and clear substance in the minde; but in other Souls, it is indeed a light, yet not a substance: As elsewhere concerning the Original of Forms.

6 The Creator (to whom be all honour) hath kept a certain progresse from a like thing, who instructs us in the Seat-royal of the Soul, that from the more grosse things we may consider things more abstracted: For in a Tree (an Argument is peculiarly drawn from a Tree, by reason of the prerogative of the Tree of Life) is seen a Root, the vital beginning of it self: For truly, in the Root as it were in a Kitchin, a foreign juyce of the Earth is cocted, altered, is alienated from its anient simplicity of water, and undergoes the disposition of a vital Ferment there placed: But being cocted, it is distributed from thence, that it may more and more be constrained, and become like, according to the necessity of every further Cook-room, which hath established Lawes for the Spirit inhabiting. So in the middle Trunk of the Body of man, is the Stomach, which is not onely the Sack or Scrip, or the pot of the Food; but in the Stomach, especially in its Orifice or upper mouth, as it were in a Central point and Root, is the Principle of life, of the digestion of meats, and the disposing of the same unto life, most evidently established.

7 For whatsoever natural Phylosophers have ever thorowly weighed concerning the heart that is of great moment; they, will they, nill they, they have made all that common to the Stomach. So as *Cardiognus* or the griping bicing of the heart, *Cardialgia* or the pain of the heart, have been withdrawn from the Stomach, by a transchangeative and borrowed name; and likewise swoonings, faintings, and epileptical insults or fits of the Falling-sickness, and those things which do seem to carry the Rains of life, do take their original from the mouth of the Stomach: For in bloud-letting that is daily seen; wherein very often, presently after a Vein is opened, giddinesses of the Head, and likewise dulnesses and obscurings of the sight are manifestly felt to spring from the Stomach, and to cease again, as oft as the finger is laid upon the opened Vein, and it being removed from thence, the same Sumptoms are again felt to arise from the Stomach, and to be stirred up from thence. Again, the Authority of the Word confirmeth my Paradox, in the entrance, while it asketh, What Cogitations have ascended unto your heart? It doth not say, they descend unto your heart: As neither what Cogitations are bred or do arise from your heart: For therefore also, many times, the Stomach is called by the name of the heart, when as Adulteries and sins are reckoned to arise from the heart.

For every Cogitation, in its first Original, ought to spring from elsewhere than in the heart: For the Pulse and vehement and unceasing motion of the heart would have forbid that thing: Because that Cogitation or thinking ought to be made in rest or quiet. As oft therefore as Cogitation is attributed to the heart, that manner of speaking is according to the acceptation of the vulgar, by taking the heart for the Seat of the Soul. And although the necessity of Seeds in Plants do tend further, unto a multiplicity of Functions, and consequently also doth proceed into the diversities of kinds of parts, yet the vegetative power, doth not therefore depart out of its antient, and vegetal Bride-bed, wherein it hath once fixt its Seat, neither doth it wander, or divide it self by reason of the dispersing of the Kitchins. That thing happens after a more formal and manifest manner, after that the disposition of the Seed hath adorned a Beast-like figure, and hath ordained a variety of members: For then the sensitive and motive Soul is given, and it is not stablished in any other place than in the Root, wherein it afterwards prepareth all Fuel or nourishment for it self.

Indeed, in speaking properly, and understanding distinctly, there is not a certain vegetative Soul in Plants or brut Beasts; but there is a certain vital power, and as it were a fore-runner of the Soul: But the sensitive Soul takes into it self the Rains of that Archeal power, and that vital fore-running dispositive power doth melt in the Archeus, and afterwards submits it self unto the sensitive Soul: For the Head being as yet occupied with an animal Discourse, or the heart stirred with continual Pulses, and working unceasingly in the framing of vital Spirits, and in transplanting of venal blood into Arterial blood, are not fit Instruments for the Soul of a Beast: But when as this findeth an Inn prepared for it in the Root, it there resideth, remaineth, nor doth wander from thence to another place.

For in very deed, the heart is a servant to the stomach, while it all its life long onely employeth it self in framing of the vital Spirits: For the entrance of the life of a very tender young, begins from sucking, and sleep, and for some time so continues: Both which things do happen in the stomach: where indeed the vital Spirits are established and preserved by the soul in the Root, in which the same soul doth for the future, hope especially to be nourished, cherished, swelled, and increase:

For it was never the study or office of the soul, to wander or passe from place to place, that it may chuse out a Bride-bed for it self; because that which is directed by an understanding un-erring, is stablished in its own and certain seat, from the beginning of life: And there is that Center designed from the beginning of Creation, for the original of seeds, with a command and tie, that the soul doth not change its seat, or enquire after strange places, as it were more commodious for it self: For he who rules all things strongly, and disposeth of them sweetly, hath known the bounds or ends of every appointment: There is indeed in the brain of a living Creature, a motive virtue, and sensitive shop: But not, that therefore, the soul being shaken from its original and primary seat, shall wander from its radical Inn (designed unto it by the Creator) unto the Head: For the faculties and functions of the sensitive soul, are indeed distributed into a plurality of parts. In the mean time, the soul it self, remains unshaken from its antient place, where it was first bound and tied: For neither is it divided by reason of the diversities of offices; because it perfects all things by the ministering Organ of an Archetis, and it being as it were every where present, is an assistant to that vital beam.

First of all, it is easily perceived, that all the force of the first conceptions, and every entering and primitive stirring of disturbances doth happen about the mouth of the stomach: For if a Gun send forth a noyse unexpectedly, a shaking about the mouth of the stomach is perceived by the same stroak: So, if a sorrowful Message be brought on a sudden, a sudden and speedied alteration is no where felt, but in that Central Inn of the soul.

So that persons against their will, and at unawares have before me, there placed the desirable Inn of the soul: which Inn, because it is first in duration, discourse, motion, and the act of feeling of the external senses; so it denotes, yea convinceth, that the original Inn of the soul is in the same place: And that thing hath seemed to me most exceeding necessary to be known for the curing of Diseases, as I shall demonstrate in its place, concerning Diseases.

For very many have remained without hope of recovery; because Remedies have been applied to a member appointed for functions, but not to the Root from whence the error sprang: For the Habitation and Court where the edicts are formed, being unknown, Medicines have been rashly administred unto the places of executions: For the place of the sensitive soul being unknown, it hath been unknown hitherto, that that soul doth there receive the primitive blemish, disturbance, and contagion of most Diseases: And in the same place, Medicines

Medicines ought to be appropriated; if from the Root, a Medicine for Diseases is to be appointed: wherein surely, they have most grievously erred hitherto.

16 At least, the first motions or assaults which are not in our power; are long since admitted to happen about the Orifice of the stomach, and to climb upwards to the Head: But it is a certain thing, that every first motion doth begin from the Center; and to that the Center of the soul is wheresoever the beginning of conceptions is felt: But those are called forces, which are not in our power; because they are the first conceits of the sensitive soul, as yet out of order, and not yet diligently examined by the command of the minde.

17 But that which I write touching the seat of the sensitive soul, I understand also for the immortal minde: For truly, the minde hath not a subject more near and like to it self, wherein it may be entertained, than that vital light which is called the sensitive soul, wherein indeed the minde is involved, and tied by the bond of life, by the Command of God. But the sensitive soul perishing, through the annihilating of it self, the minde cannot any longer subsist in the Body; and therefore it hastens to the Being of Beings, that it may passe unto places appointed for it.

18 Therefore the radical Bride-bed of the sensitive soul is in the vital Archeus of the stomach, and it stands and remains there for the whole life-time: Not indeed, that the sensitive soul is entertained in the stomach, as it were in a Sack, Skin, membrane, pot, prison, little Cell, or bark: neither is it comprehended in that seat, in manner of Bodies enclosed within a purse; but after an irregular manner, it is centrally in a point, and as it were in the very undividable middle of one membranous thickness: And it is in a place, nevertheless, not plainly locally.

19 But because every Soul is a light given by the Father of Lights, and Creator of things; but I have proved elsewhere that lights are immediately in place, and mediately in a placed Air: So also the sensitive Soul is in a place or seat, whereof I write at this present: But the minde, seeing it is a lightsome substance, it pierceth a created light, which is the sensitive soul, and this likewise pierceth the minde, and blunts it with its contagion of the corruption of Adam: of which, in the Book of long life, concerning the entrance of death into man. Therefore the frail, mortal sensitive soul, is a meer vital light, given by the Father of Lights, neither is it declarable after another manner or word; seeing that in the whole World, it hath not its like, besides the light of a Candle: the which, because it burns, may be compared to a spark, yet onely by an analogical, and much unlike similitude; and as it were by the more outward husk.

21 Therefore indeed, that sensitive soul, although it be locally present, and be entertained in a place; yet it is not comprehended in a place, otherwise, than as the flame of a Candle is kindled in an exhalation; and the light in that flame, is as it were life in the aforesaid soul: yet vital lights are never parching, but are separated by as many diversities as there are differences of souls. And from thence is God called by S. James, the Father of Lights.

22 Therefore the heat of things soulified, is not of the Fountain-light of the soul; but a heating light of the vital life; and so it is the product of life; but not the life it self: And therefore also it is emulous of a Sunny light; even as in a Fish, the vital light is actually cold, because it is of the nature of the Moon: And for that cause, God made onely two and sufficient lights, for the life of sublunary things: yet the light of which light, or the souls themselves, are the subjects of inherency: And they are altogether neither Creatures, between a substance and an accident; because of the Country of the intelligible world: Therefore in the sensitive soul (for neither ever elsewhere in frail things) as it were a spiritual light, made by the Father of Lights, is the Immortal minde conjoynd, and the which also, by the hand of the Almighty, every where present, or by an Angel, is co-knit unto the sensitive soul, by the bond of life, that is, of a vital light: which is an unseparable property of the aforesaid light.

23 But the immortal minde it self, is a clear or lightsome, incorporeal substance, immediately shewing forth the Image or likeness of its God, because it hath received the same engraven on it, in creating, or in the very instant of enlivening or quickning: For both souls are created at once, and conjoynd by God, who will never attribute his own Honour of Creator unto any Creature. But before the fall of Adam, there was not a sensitive soul in man; but by what meanes or after what manner, that, together with death, hath descended at once into humane nature, that shall be shewed in its own place. At least by the coming of the sensitive soul, death hath entred, and the corruption of our whole nature, and the Majesty and Integrity of our former nature was obliterated or blotted out.

For truly, while the minde did immediately perform the offices of life, neither was the sensitive soul as yet present, immortality was also present; neither had beast-like darkness occupied the understanding.

And so man indeed suffered Ship-wrack in his own nature, and that an unrestorable one: 25
but by the new birth, under the calamities of tribulations, man is exalted in a far more excellent manner, while from the image of God, he is taken, as adopted for his Son. Furthermore, it is altogether necessary, that every motion of the first force, and of the first conception of the soul, doth happen in the chamber of the soul: which thing, although it be chiefly felt about the Orifice of the stomach, and God be admirable in his works; because indeed, it hath 26
well pleased him to dispose such admirable powers in the membranes of the stomach, womb, and skins that cover the Brain, because they do bear before them as it were a certain image of a Common-wealth; yet I have found the Spleen readily to serve for the ferment of the stomach, and for the Sun, Coacter, and Director thereof. Therefore I have decreed, to call the conspiracy of both Bowels, the Duumvirate or Sheriff-dome. For although the digestive ferment, and the like aids, may seem to shew forth a Family-service of servants; yet the service of household-servants in vitals, as it contains a power and strength, so also it promiseth dignity and authority: So that, as in the stomach there are feelings, faintings of the whole body, and most sensible, manifest, and open priviledges of coctions; nevertheless, the vital breathing-hole, causing the digestions of so manifold arteries, and so mightily of the stomach, hath commanded, that without a duality, disagreement, or powerful preference, there ought to be made one Family-administration of both Bowels; indeed by divers offices, into one conspiring scope, although both do singularly attend on their own work, therefore also separated in place. Truly, there is one onely endeavour of the Duumvirate, and agreeing, and set harmony of intention. Therefore the neighbouring Spleen doth lay on the stomach without, as if it would nourish the same by a lively co-weaving of arteries:

Not indeed that the arteries do give all force or virtue to the Spleen, but they have themselves as Bowels, after the manner of Stars: For although the Stars do borrow their light from the Sun, yet there is in every one of them his own peculiar property, and strength of acting, which is far most evident in the Moon, about the ebbings, flowings, and overflowings of the Sea. 27

Be it therefore, that the arteries of the Spleen do supply the place of the Sun; yet the Spleen 28
itself hath obtained a double and native dignity peculiar to it self, although the Family-service of the Heart rejoyceth in the preparing of vital blood and spirit. Therefore the Spleen is the seat of the Archeus, the which seeing he is the immediate Instrument of the sensitive soul, doth determine, or limit or dispose of the vital actions of the soul residing in the stomach: For the sensitive soul doth scarce meditate of any thing without the help of the Archeus, because it rejoyceth not being abstracted, as doth the minde; the which in its ebbing or going back by an extasie, doth sometimes, and without the props of the Archeus and corporal Air, intellectually contemplate of many and great things. Also in exorbitances of the Archeus, an aversion, confusion, exorbitancy, and indignation is administered.

And the sensitive soul it self, being as it were the husk of the minde, doth alwayes, will it, 29
will it, make use of the Archeus: Hence indeed all foolish madneses (some whereof onely have been made known) are called præcordial or Midriffe ones, and are ascribed to the place about the short Ribs: the which notwithstanding, do spring from the same seat, and the same fountain of the soul, as it were by the hurting of one onely point.

Also Remedies do scarce materially go without the hedges or bounds of the stomach: 30
And therefore, they are rare, which are brought thorow, unto the spleen: which thing in the difficulties of a *Quartane* Ague is plain enough to be seen: For the immortal minde is read to be inspired into *Adam*, by omnipotency, and that without the Wedlock of the sensitive soul: And that breath of life, he calls a substance: And therefore that is not found to be breathed into brut Beasts.

Therefore the minde was first of all immediately tied to the Archeus, as to its own 31
Organ or Instrument, the which, therefore it could at its pleasure, daily substitute a-new, out of the meats, being sufficiently, and alwayes and perpetually alike strong: And from thence to awaken the immortal life, worthy of or meet for it self: For truly, the immortal minde being every where present, did perform all the offices of life immediately by the Archeus (and the which therefore doth borrow his own liveliness from the minde) who also is therefore after some sort, superiour to mortal things, and seemed to be the foster-Child of a more excellent Monarchy, than of a sublunary one. These things were so, before the fall of *Adam*: But seeing that in the same day of their transgression, they were made guilty of death; a soul subject to death, came unto them, the Vicareffe and Companion of the

the minde : To wit, unto whom the minde it self straightway transferred the dispositions of the government of the Body: For at first, there was an immediate Wed-lock of the immortal minde with the Archeus. Presently after the fall, and the stirring up of the sensitive soul, the minde withdrew it self like a Kernel, into the center of the sensitive soul, whereto it was tied by the bond of life. The minde is not nourished by foods; it could chuse meats for its own Archeus, and prepare them for him, who now is constrained with an unwearied study to watch for his own support of nourishment: And that, by degrees, he lesse and lesse fitly prepares and applies to himself, by reason of the defective duration, and power of the sensitive soul. Thus therefore, I ought to speak concerning the seat of the minde, of the material occasion of mortality, and the necessities of Diseases and distemper: For truly, what things are here required, in the Treatise of the entrance of death into humane nature, is demonstrated at large, with an explication of that Text: *From the North shall evil be stretched out over all the Inhabitants of the Earth.* Therefore, for a Summary: The central place of the Soul, is the Orifice or upper mouth of the stomach, no otherwise, than as the Root of Vegetables is the vital place of the same. The minde sitteth in the sensitive soul, whereto it was consequently bound after the fall: But the Brain is the executive member of the conceits of the soul, as it sits chief over the sinews and muscles, in respect of motion; but in respect of sense or feeling, it possesseth in it self, the faculties of memory, will, and Imagination: Therefore the stomach failing, or being defective, there are palenesses, tremblings, drith's, Consumptions of the flesh and strength, wringings of the Belly or Guts, the Asthma or stoppage of breathing, Jaundises, Palsies, Convulsions, giddinesses of the Head, Apoplexies, &c. For the most famous Physicians do wonder, that oft-times extreame defects are overcome, not otherwise, than by remedies pertaining to the stomach, and that the evil of the stomach doth bring forth Diseases far distant from it self. And the more modern Physicians are amazed, that vulnerary potions should successfully cure wounds of the joynts: And that according to *Paracelsus*, the Cancer, Wolf, the eating inflamed Ulcer, are cured by a Drink.

- 33 Therefore the error of those that cure the more outward parts that are ill-affected, as if they were fundamental ones, and they who do translate all healing about the head, it being hurt by the lower parts, proceedeth from hence, by reason of the ignorance of the seat of the Soul, life, and government.

CHAP. XXXVIII.

From the Seat of the Soul unto Diseases.

1. A greater sense is proved to be in the mouth of the Stomach, than in the eye, or fingers. 2. The Schools do every where, being unconstrained, consent to the Paradox concerning the seat of the Soul, although they do openly dissent therefrom. 3. The wayling of those that are exorbitant through much leachery. 4. The life of the stomach is chief over the other digestions. 5. The Ferment that is a friend to the stomach, is afterwards an enemy to all the particular shops of digestions. 6. Divers Diseases are stirred up by the Ferment of the stomach being transplanted. 7. The snare of Catarrhs. 8. The foundation of Diseases. 9. The joynt-sickness proves that thing. 10. Very many Diseases do flow centrally from the stomach, which are feared, and healed by the Head. 11. Of what sort the co-mixture of the Character of some Diseases may be. 12. How Medicines applied to or bound about the Head, do operate. 13. It is proved, that the seat of the Soul is not in the heart it self. 14. Remarkable things about the Character of Diseases. 15. Why the effects of fear do vary their own effects. 16. The same thing is considered for a poisonous occasional cause. 17. They are appropriated to the vital light. 18. An objection. 19. The intent of the Author. 20. A most notable decree or opinion about the Direction, Power, Progress, &c. of Remedies. 21. The healing of a remote wound, and the notable force of Alcalies restraining remote sharpnesses from the stomach. 22. The Schools are deceived about the Remedies of wounds. 23. A lixivial Salt doth potentially lay hid in Herbs, and performeth other things, which the Alkali of things calcined do not so easily do. 24. Whence the diversity in the Remedy of a wound, and Ulcer is. 25. The diuretical or Urine-provoking virtue in a vulnerary potential Alkali, is examined.

THE mouth of the stomach doth (very often) not endure the hand laid on it, although on both sides supported by the Ribs; for a sure token, that it doth there undergo a most acute and precise sense or feeling, which otherwise did seem to be required rather in the tops of the fingers for the distinguishing of things to be felt: But that it cannot suffer the hand laying upon it, by howsoever acceptable a Luke-warmth, obvious, nor burthening it with its weight; that very thing bewrayeth, that the life, the fountain of all sensibleness, is there: which notwithstanding, as it doth primarily accuse it self to be thus affected; So also it makes it plain, that it is the sensitive soul, principally obvious to hurtful things, being involved in the immortal minde. But loe, I look back to the Schools, who being uncompeled, do confess the tenderness, or the too much acute, exact, and precise feeling of the Orifice of the stomach, to cause almost all swooning of the minde. And these things they say, neither in the mean time, do they reflect themselves on their own Maxims stablished concerning the heart, neither do they consider, that that sharp sense, thus named by them, doth argue nothing else besides a vital aptness, but not that more, or more open or manifest finews have happened to one part more than to another. In the mean time, they have not once considered, that the life or soul is entertained in that seat; they being unwilling to have the soul beheld in a Sack or Membrane: and they had rather believe it to be laid up in the bellows of the eares of the heart, or in the idle or slow Brain: For although they delivered their hands bound, while they marked or perceived that there are virtues in the Membrane of the womb, troubling, or stirring up commotions in the whole Body; yet the priviledge hath not been as yet granted to the Schools, of beholding, and confessing, that that thing is likewise granted to the stomach.

P p

Indeed

3 Indeed by the complaints of many that do wantonize with foolish leachery, they were compelled; because they did bewail that they were oppressed with an evening howling, and vexed about the mouth of the Stomach: But the Schools have not therefore recalled the traditions of the heathens into a doubt, nor at least, being pricked by the way, have they doubted to hold it confirmed; whether happily there might be in the same place, the light, or entrance of a vital Beginning, which being primarily affected by provoking causes, might first feel its own discommodities: For neither is the command decreed but by the Court; as neither is the power of life delegated or appointed, but by the life the President, that is, the Soul. For it is from thence first manifested, that unlesse a granted Character be imprinted on the Seed by the sensitive Soul, that very seed is to remain barren and monstrous; no otherwise, than as the flower of a Pompion, whereto a small Pompion is not seen joyned, or grown behind. Therefore, if the Soul doth sit as in an Inn, whence seeds do originally borrow the Character of their own fruitfulness; it is also not to be doubted, that the powers, as well those vital, as propagative, do lay hid in the same place:

4 And moreover, because that seat of the sensitive soul doth not only govern the digestive faculty of the Stomach, and doth stir up an unnamed sourness of the ferment of the Stomach unto this purpose, and suffers it to be clean taken away from it self, according to the vigour of the laws of nature, and to be cut short of its bound: But the very life of the Stomach is chief over all the digestions of the whole body, however dispersed into hidden, or also remote dens: Indeed, that is proper to the soul, by a singular radiation or in-beaming, and as it were participating of its own life, as though by an only and naked beck, and command of the Duumvirate, it did constrain obedience from on every side, and that it were due unto it from every one: whence it likewise follows, that the same vital vigour is every way dilated, and by an erroneous guidance, that the exorbitances of the same are also diseasedly transplanted even to the fingers ends.

5 So indeed, that hostile sourness, the which, although it be acceptable to the Stomach, yea and very meetly requisite; yet now, in strange soyls, it becomes an enemy: For neither is the proof of that hostility to be borrowed from far: for truly in the dog-dayes it is plain enough to be seen, that fleshes, presently after they have entred the threshold of their begun corruption, they afford sour broths, and those tinged with an unwonted colour.

6 Therefore a forreign guest of the Stomach being brought by a vital Beginning, unto a strange field, some strange defect doth for that very cause, presently follow, which doth for the most part also, presently bewray its presence. Indeed, it is a disease, which if it be brought into the Veins, through the error of the Duumvirate badly enraged or enflamed, it brings forth Fevers: But if the hostile sourness or sharpness be brought into the habite of the body, or joynts, divers Apostems, and errors of the joynt sickness are straightway present: Apostems I say, which, with the least matter, do bite, no otherwise than as thorns, or an enforced Dart do at length hasten into corrupt Pus, a weeping liquor, and thin corrupt sanies.

7 This indeed is the deceitful snare of Catarrhes or Rheumes, which hath ensnared the Schools even unto late dayes, through the various descendings, defluxions, falls, and slidings of humours not existing: And it was easie for Satan to have driven readily inclined minds, seduced by Paganisme, headlong, hitherto; no otherwise than as Astrologers have intently noted the undeclarable scituation of the Moon and Planets, have feigned excentricall ones relatively, and simply, the which indeed they knew to be vain, and feigned for the necessitie of scituations found by measuring. But in healing that was nearer for Satan, thus to have deceived his own, that is, Pagans; because sense, an industrious and importunate perswader was at hand, whom to prevent, it hath been neglected, while Art began in hast to be drawn unto lucre. For truly, from those things which are alleadged in the Treatise of Catarrhs, concluded demonstratively and necessarily, that is obvious to any one, that there is no matter for Rheums, likewise not a kitchin, place, wherein, or where they should be prepared, as neither a channel through which they should so diversly flow down even unto the most distant Coasts of the Body.

8 But that it is a far more easie and nigh thing (but only the hand being once delivered to Gentilism, hindereth, and that by a credulity they have stopp up their own way of enquiring into the truth) to meditate that the life is to be on every side continued from the Principle of life: next also, that from a vital error, errors are spread throughout the whole body, also into the whole body, even into the part as well containing, as the part contained. Again, It hath been rashly and frivolously devised, that this foundation being once passed by, any kind of remedy would be made voyd by successors, thenceforth deceived by Satanical craft: which thing, I would those that come after, might with me sufficiently contemplate: for from thenceforth they should also easily with tears, discern the great blindness of mortal men, as well in Physitians, as in all places, in medicinable things.

For

For gowty persons are first ushered in, and they should accuse the Stomach, and that they do there feel the first motions, and as it were feverish disturbances, as the fore-runners of a fit: For the tartness conceived and bred in the same place, only by the aspect and in-beaming of the vital light, is erroneously translated into a seminal gléw, which they now call *Sunovia*, and it is the transparent nourishable seed of the joynts, and it is there the more plentifully laid up, by reason of the frequency of motions, and a strong com-pressing of the bones: For truly otherwise, the bones should very shortly rage with heat, and be dried by a mutual rubbing together. But although these things are much more fully described in the Chapter of the Gout, yet it is profitable for me more plainly to enlarge them.

Surely, divers diseases are met withal, which draw their original centrally from the Stomach, whose rise and remedy are hitherto by an unhappy guess, unknown: For there are in the Concave or hollownesse of the Stomach, sharp or sour, bitter, salt, burntish or stinking, poysonous, unfavoury, &c. favours, & especially the sour, fermental, & digestive or trans-changeative savour is not proper or natural to the Stomach; but it is prepared and inspired into it, by the Kitchen of the spleen, being a neighbour unto it for this end; which ferment indeed failing, for that very cause there is an un-concoction in the house, a difficult or slow coction, a dejected appetite, a loathing of meats; which things are presently beheld to be proper to, and stamped on fevers. Wherefore the old man hath said, *That sour belchings coming upon burntish or stinking ones, is a good sign.* Also it sometimes happens that a sparing ferment doth flow unto the Stomach: From thence also that an unnourishing or wasting of flesh is stirred up, and that meats do become hard to be costed: Yea, the Stomach which seemeth to be deprived of its ordinary feeling, neither which feels any things but those which are hurtful, and that as oft as it is unworthily affected by forreign things contained within it; it presently under the smallnesse of the ferment, brings forth a watery liquor, and is busie in thrusting it out with a loathing. But I call that watery, which now and then is nothing but a meer water, likewise a slimy mucilage, also oft-times, unfavoury, and not seldome seasoned with a forreign tartness, which doth as far differ from a vital ferment, as a dead man doth from a living one; so that, although they do participate in taste, yet they very far differ from each other; which may be seen in the bitterness of Wormwood, and of asses or wild cucumber, or Coloquintida. For while the drink, & also the nourishment to be adjoynd in the Stomach, do offend through the penury of a lively ferment, they presently decay into a yellow liquor, which the Schools have hitherto falsely called the bowel Gaul, yea also one of the four constitutive humours of the venal blood; being ignorant the while, by what an hour and guider, choler should be seperated unmixed from the venal blood, nigh akin to, and intimately well mixed with it, and that (surely much changed from choler swimming on the blood) should be all alone brought unto the Stomach; Seeing there is not a passage from the Liver unto the Stomach, but by so many windings, which may worthily accuse this invention of the Schools of blockishness. But when the nourishment approacheth to the Stomach, that it may be made like unto it, and nourish it, and it faileth through the penury of the ferment, or a storm otherwise arisen in the Stomach, it presently putrifies and becomes infamous with a burnt savour: For that being detained in a lukewarm place, which hath now entred the threshold of life, and hath been received into the number of things by and by vital, it presently also putrifies, is made burntish, yea if delay shall have access, it becomes cadaverous: Whence are the disease of choler, lenteries or smoothnesses of the bowels, belly passions, &c. Also now and then the *Archens* of the Stomach, being even unwilling to supply the smallness of a sour ferment, is wroth, and brings forth a sharp, sour, cruel one; from thence are inordinate appetites, and likewise wringings as well in the Stomach, as in the bowels themselves, for the most part cruel ones. But if the plenty or harshness of food, doth flow unto, and overflow a moderate sour ferment, then the whole food waxeth bitter, that excrement by such a degeneration grows yellow, and gross, and a various Troop of evils being thereby kindled, it riseth up into a Flux, unless the whole be at once presently cast forth by stool. Sometimes also the *Archens* of the Stomach doth conceive a fury, & is enflamed of his own free accord, so as the tartness doth not strike into the meats, but doth wandringly infect the *Archens* himself: Then indeed the joynt sickness or Gout is conceived, and the *Archens* being diffused throughout the whole body, doth notwithstanding immediately affect with its sharpness, the *Sunovia* or raw seed immediately adjudged for the fashioning of the Bones, and therefore laid up within the joynts: But he defiles the *Sunovia* or raw Seed of the more weak part in the strength of nature: Therefore the joynt sickness is reckoned to choose at pleasure, the part which it apprehendeth. And because that tartness being received in the center of the Stomach, is dispersed by the *Archens* unto remote places; therefore it is false that defluxions are propagated from the head, through the sinews and veins. So indeed, great wringings of the belly, by a conserving or consent of parts, do stir up a hurtful sharpness in the Stomach; which

- which afterwards do oft-times wondrously shake the hands, and feet with a convulsion, and likewise straightway after, doth also resolve them with a Palsie. Therefore an undue rartnesse of the Stomach, if it lay hold of the dewy nourishment, and the spermatick nourishable juice thereof, how slenderly soever it be, it stirs up giddinesses of the head; and by so much the more troublesome ones, by how much these do the more behold or respect its hinder part. But an Apoplexy ariseth, while as an unfavoury Muscilage, plainly by a strange motion and entertainment, doth enter from the hollow of the Stomach into the veins thereof, about the Orifice, and doth keep the rightness of its own side, and distinguisheth a great one from a lesse, by the absence or presence of poysonsomnesse. But there is for the most part in such chronical diseases, a certain sealing Character: So indeed the Gout doth oft-times issue from the Beginning of the Parents into the off-spring, and doth there patiently wait very many years, before that the proper fruit thereof doth obtain its own ripeness. Therefore in the vital Beginnings and radical Organs of the Stomach (which are the local, or implanted *Archens* it self) that post-hume and translated gouty character or impression, doth stick fast by a hereditary right; and consequently, likewise also, that enticed character which is gotten by an inordinacy of living, that sits in the *Archens* of the orifice of the Stomach; the which, while it is wearied by the insolency of a strange guest, doth sharpen it self for an expulsion of the same, and from thence also the fruit of an Apoplexy issues: For neither is that silent gouty Character materially laid up in a certain nest within, and received in a separated Stable, in the folds and wrinkles of the Stomach, as it were some forreign Tartar adhering to it; But it is a committed character in the very *Archens* of life. For let us feign a unity of the thing supposed, and of the property, whereby that character doth lay intombed for the Gout, Apoplexy, or Falling evil, and is stirred up at the set stations of its own ripeness, or is much stirred by certain meats taken, or smells. And then let us consider the natural sharpness of the Stomach, now degenerate, and likewise the tenderness of its orifice, stirring up swoonings and falling sicknesses (which testifies nothing besides an easie feeling, hurting, suffering, disturbance of the life, and so an enemy present, tumulding from very many things) therefore if the sharpness which is co-mingled with the *Archens*, be stirred up besides nature, and seeing this is chief over all the particular digestions, that sharpness is beamingly brought down unto strange cottages, where o is wholly an enemy; and from thence doth the Gout or joynt sickness issue forth. But if it be co-knit to the meat, or drink, pains of the Colick, wringings of the Guts, and other exorbitances of the parts occasionally are present. But if that the sharpness of the Stomach doth degenerate, and associate it self with an opiate or drowsie poyson, with a piercing toward the seat of the Soul, the falling evil is straightway present. But if a stinking muscilage inclining to bitterness doth arise, there is a giddiness of the head; and that more strongly insulting, doth stir up an Apoplexy. For neither is it meet to distinguish those precisely from each other, while it is better to have the matter or occasion exhausted.
- 12 Likewise some external Medicines bound about the head, do preserve from an Epileptical fall and fit, which is for a signe, that either the fruit of the Character is hindered, or the applying of the occasion to the *Archens*: Indeed in either manner the hurtfull matter is to be letted or prevented, to be extinguished or annihilated, that it be not co-mingled with the *Archens*. And moreover, as vegetables are wont for the most part, to sleep in Winter, and to be as it were awakened at Spring, that they may send forth a bud, leaves, flowers, or fruits; So a Gouty, Epileptical, &c. Character, is also stirred up into a ripeness at a set period, unlesse the importunity of provoking things do forestall it: At leastwise, the giddiness of the head, and Apoplexy, &c. although they are brought back within occasional causes; yet they do sit immediately within the very nest of life, in the *Archens*, which indeed is implanted in the orifice or upper mouth of the Stomach. For in how easie a breviary, by things hanged on the neck or body, is the falling-evil suspended and detained? Because an entrance of the hurtful cause into the sensitive soul, is hindered; for there is a piercing of the hurtful cause lurking in the *Archens*, to within, and the which doth therefore wholly take away the mind: Indeed it leaves a pulse, to wit, of the heart, but it so tramples on the sense, imagination, and every principal power of the soul, that for that space of time, they seem to be plainly withdrawn. From whence also we must note with a pen of iron, that the Soul so trampled upon, doth not dwell in the heart, which never a whit stumbleth.
- 13 But the Gout, as it tends to without, so the Character thereof doth not so much affect the secret chamber, or seat of the soul, as the *Archens* the President or chief Ruler of the digestions: which things do therefore happen, because an hereditary character of the Gout is stamped on the Young, from the beginning of Generation, and long before its quickning: And therefore, it respecteth only the *Archens* (but not the soul) which then alone bare the whole burden on himself. But he that hath gotten the Character of the Gout by the exorbitances

tances of his life, although it shall come to him being a man in years, yet it keeps the nature of its own property: whence it is made manifest, that the stamp or character of every disease is promiscuously to be admitted into the lap of the sensitive soul.

So that as great fear hath made many persons Epileptical or to have the falling sickness for their life time; so a co-like fear hath afterwards rendred many free from the Gout. Indeed in the one, the fear generated in the conjunction of the life and sensitive soul, an Epileptical character; which fear being more slack by one or two degrees, and more outwardly, killed the character of the Gout, and rendred it either congealed by the fear, or even oppressed the Root thereof. Black choler according to *Hippocrates* (which seeing it hath no where ever existed, is to be taken for the effect attributed to that choler) subsisting in the *Midriffs* (for he hath had respect unto the seat of the soul or the *Duumvirate*, nor yet known) if it be dispersed into the body, provoketh the falling sickness; but if into the soul, madness. For such was the plainness of the first age, which indeed did candidly sift things; but for want of light from above, it came not unto the grounds of the matter. There are some simples which are without a valuable abhorrency, which by eating of them, do produce true madness; but others cause sleep: some also produce madmen for term of life, but others do bring forth doatages only, as it were certain drunkennesses; according also to the equalities whereof, I will have the characters of diseases to be judged: Because not only such hostile things being taken, health, the mind, or life is alienated; but hurtful matters being conceived, bred, and procured within, or also characters only, divers properties are introduced into the life; or into the *Archeus* the instrument of life: And not only those good inclinations of fathers, or grandfathers, are propagated into the Seed; but also, certain disease seedinesses, such as are in simples, are co-bred, being as it were hardly threatned on us: The which indeed, as they do deserve a serious observation; so much the more, as oft as that hostile and disease poyson is divers wayes coupled, sometimes to the ferment of the Stomach, sometimes to the implanted *Archeus*, then next unto the arterial spirit, also oft-times beamingly to the life it self, which indeed is nothing but a central light, capable also to be pierced by any radial or beamy light: So indeed the vital light of the sensitive soul is pierced by a forreign light, being coupled with it, no otherwise then as light thorow coloured glasse, doth tinge a simple light in the wall. Truly in the Monarchy belonging to life, and the which descendeth from the father of lights, are those living lights, which otherwise do shine in a simple Sunnie light, or in a coloured light, being attributed wholly to a fraile or mortal light: And there is a combination of living lights, not only capable of bearing each other, but also active on each other: so that from hence it is plain, that the Father of lights doth restrain the Bridles of life, and of whole nature. Therefore in the Arteries of the spleen, or in the very substance of that Bowel, is now a property stamped (which I call the characteristical one of a disease) or next in the very coat, veins, sinews of the Stomach, or also in the vital *Archeus* of the same; which property doth propagate it self by intervals or spaces, into the sensitive soul; or it shineth thorough it with a continual fewel, and compels that soul to be its Chamber-maid; so that the soul it self, or the life or vital *Archeus* thereof, being vexed or troubled by turns, they are carried headlong into some motion of fury, madness, swooning, giddiness of the head, falling evil, apoplexy, palsey, convulsion, &c.

I know well enough, that the adverse party that is not desirous to learn, will accuse the mist which I spread, while I wrest these sublunary things aside unto the life, unto vital lights, or unto the invisible world, where the Father of lights is President: But I pray, let them remember, that this is the right way, which else, cannot be searched into from a former cause: And let them know, that vital motions are not disturbed by, and doe not depend on the life; Whether the while we contemplate of our life, or in the next place, of the life and vital properties, which do appear to us disease, mortal, and hateful.

Truly I every where behold it to be nothing but the common good of my neighbour, for to open the windows, whereby the light of nature, hitherto obscured, may come into the Schools, and wits more successful than my self: Wherefore I have withdrawn the Complexions of elementary qualities, and likewise the humours, tartars, and these kind of dreams of Writers: I could wish, that in the room of them, a true knowledge of nature, and diligent search of our selves were introduced. Lastly, I have taken away Catarrhs or Rheums out of the midst of them, as vain fictions, and broken staffs, wherewith mortals have been hitherto supported: And so, whatsoever hath deceived these, through the fraud and deceit of a humour flowing down, as the cause making a disease, all that is to be referred into the fruit and product of a vital cause: and that which is thought by the Schools materially to flow down out of the head, that is darted, shot, beamed forth and propagated from the vital seat of the soul, by a common guidance

guidance of the Archeus, or is in-filled by a participation of life. Good God, how far do I dissent from the tradition of the Antients? I would there may be such, or at least I would thou mayest make them such, who may comprehend me, and nourish the hope of the sick with a richer talent! But thou, O God, wilt do in these things, according to thy own good pleasure, to whom I totally refer and offer all things, and every thing, which I have, know, see, and am able to do. I return therefore unto my path.

20 First of all, I have elsewhere shewn, that vulnerary or wound-herbs do operate, by virtue of a certain in-bred Alkali or Lixivial Salt. Indeed I have taught, that vulnerary Mercury, as well the præcipitate, as sublimate, are easily to be revived, a clarified juyce being imbibed by boiling: Whence it follows, that those herbs are the more excellent in this degree, that juyce of whom, being boiled with the præcipitate, and afterwards washed away, shall the more easily and plentifully revive the Mercury. Wherefore also in healing, the stone of Crabs doth excell, if it be drunk with wine, more than if in water; because that stone, in wine, doth most easily put on the virtue and savour of a *Lixivium* or Lye. Neither I pray, therefore, let the Physician abhor the use of wine in a wound, or fever, &c. For at that very time that it savours of an Alkali, it loseth the virtues & property of wine: For so, the Lixivial Salt of the Teil-tree is successfully given to drink, no otherwise than that powder of Crabs. For the goodness of God hath invired us, that by reason of the rareness whereby that stone doth subsist in a little space, mortals may be drawn into an admiration thereof, and thereby also may learn its virtues, and may sift out its property alike wonderful, whereby it profiteth wounded, bruised people, and those that have fallen head-long from an high place.

21 And here presently a wonder not yet declared, comes to light; to wit, that a wound in the foot, and also in the leg, or in the most remote parts from the mouth, is healed; whither notwithstanding no *Alkali* hath ever obtained access, to wit, as the *Lixivial* Salt of this Stone doth correct the sharpness, which is kindled in the utmost members, or habit of the body, and which is prepared to be kindled. For neither doth the force of the *Alkali* passe from the Stomach thorow the Veins, even into the Toes: But neither is it admitted thither: and although it should be admitted, yet it could not proceed free and unbroken, thorow the foregoing questions and examinations of digestions: For there is no man, which may be ignorant of this, and not grant me what I have said.

22 Therefore from thence it is altogether manifest, that that *Alkali*, although it go not materially even unto the habit of the body; yet it is sufficient, that it doth disperse its property even thither, beamingly onely, that it shall forbid a sourness or sharpness in the stomach, the Fountain of Digestions, and the chief Court-house of life; wherein is manifested the power of the Stomach over all the families of digestions. Wherefore from a contrary sense, they have sometime perceived, that wine, because it easily waxeth sour within us, it enflames, and perverts wounds, unless by a vulnerary Lixivial fixed Salt being administered, that sharp faculty of the wine become mild: For truly the hurt or damage of a wound is onely an inward fermental sharpness, which being absent, the lips of that which was continued, do hasten to run together. Wherefore the Schools being deceived, have universally forbidden wine to those that are wounded; which thing the use of a vulnerary remedy at this day hath disallowed, to the disgrace of the Schools: For neither doth an *Alkali* go materially unto places far off, to restrain sharpness; seeing neither indeed is it able to pierce unto the Spleen, the seat of a Quartan Ague. Therefore it sufficeth, that it restraineth sharpness in the Stomach, the ruler of all the digestions: Nor indeed that it destroyeth the sour ferment of the Stomach, but as it is corrected, and the translocation of the ferment unto remote places, is hindered: which thing also the aforesaid Paradox it self confirmeth, to wit, that the digestion of the Stomach is chief over the particular digestions of a thousand kitchins.

23 And then, that there is not made a wandring of Lixivial Salts, materially; & that it is better to drink the *Alkalies* of these stones, than calcined Shell-fishes: Because that although they do help, and the Alkali in calcined things is far more powerful; yet it hath under an actual vigour, vitiated the ferment of the Stomach, or at least doth incline it: Whereas the Stone of Crabs is carried not so much into the ferment, as into the product of the ferment. Also there is a plain reason, why that Stone, and herbs like unto it, do heal great and remote wounds, yet that they do not any thing help small ulcers in the throat, wind-pipe, or bladder:

24 For it is also hence confirmed; because every Wound doth sharpen its state, if the sourness beaming forth out of the Stomach unto the wound from the vital digestion, be also hindered to be in the remedy: But because an ulcer doth not arise out of the sharpness of the Stomach; but from the proper vice and received contagion of the Archeus of the parts:

The

The which also therefore, is not appeased by the taking of an Alkali, and there is need of Secrets piercing every way. For meats, drinks, and medicines do lose their own virtue or strength about the first digestion of the stomach; neither do they go, or are carried deeper; because they onely nourish simply, and therefore do there put off, and plainly detest every mask horrid to nourishment, or are otherwise changed into excrements: And so also they are made unprofitable for the conceived curing.

But if indeed the Stone of Crabs be a provoker of urine, it is not that therefore the coming thereof even into the bladder is to be hoped for, or that its virtue remains untouched, and unbroken; Far be it: For let it be sufficient, if that Stone do spoil the whole drink of a souring faculty; because it is that which onely, how little soever of it be brought down in the urine, belongs to the breeding of the Strangury or pissing by drops, Dysury or difficulty of pissing, and heats familiar in the disease of the Stone: For the sharpnesse, although it be most excellently subdued by a sound gaul; yet the least quantity of it may be hostile in the urine, and to the parts subservient unto it, and no lesse unto the whole remaining family of digestions. Now at length I return unto the Authority of the Duumvirate, that it may be manifest in what sort the soul doth divers ways exercise its own commands in its own body, and doth act by way of a command, government, rule, as also of cruelty, fury, and tyranny; neither that to this end, it stands in need of pipes, winds, vapours, smoaks, and least of all, of the help of heats, colds, and defluxions. The Schools beholding the effects of the Duumvirate, and thinking to knit causes to them all, have transferred all things into heats, or humours, and the declinings or cessations of these; as if those things which naturally happen in us, should happen only through an urgent necessity of weights, heats, and imaginary humours.

And seeing they have gone back from the Soul, from living strength, unto the artificial, or dead examples of learning by demonstration; at length they have quieted themselves; that they wrought in vain, with the admiration, unwilling experience, and wonted obseruation of the vulgar, that many diseases being among the catalogue of incurable ones, or the number of wonted diseases, are of their own accord cured under the care of the Kitchin; so that they had but forsaken the vein, and the paunch, oft-times unto the death, or voluntary wearinesse of the sick. And at last, for the most part, a Jugler or Fortune-teller, or an aged old woman cureth them, whom the very experiences of Physicians had deserted.

CHAP. XXXIX.

The Authority or Priviledge of the Duumvirate.

1. An Aphorism of the old man is illustrated. 2. The falling-evil and madnesse are proved to proceed from the Duumvirate. 3. That sleep is from the Duumvirate. 4. An argument against the prerogative of the head. 5. The same thing is confirmed from Galen against his will. 6. A privy shift of the Schools for the head. 7. What all particular Senses can attribute unto the thing generated. 8. The vegetative power is in and from the Duumvirate. 9. The Young lives divers wayes. 10. The phantasie of the Brain doth presently die, unlesse it be nourished by the lower parts. 11. Why the soul is said to be in the blood. 12. Concepts ascending from the parts about the short ribs, are presently seen in the countenance. 13. The first conceptions are proved to be formed in the seat of the soul. 14. Sleep and dreams to be from the Duumvirate. 15. The Mare is in the stomach; therefore sleep and dreams are from thence. 16. But the Gumm-ich before the coming of teeth, from the sensitive soul only. 17. The opinion of the Schools about the Mare. 18. It is noted for an absurdity. 19. Balaams Ass spake not the word of the Angel. 20. An history of my own sleep fall. 21. Some dignities of the Pylorus are reckoned up, and astonishing remedies, by reason of their easinesse. 22. Concerning the seat of the soul for the Duumvirate. 23. An history of madnesse from a medicine as yet existing in the stomach. 24. The same by fainting or swooning. 25. From a Maxim of the Schools. 26. From the suffering of hunger. 27. That troublous passions of the mind have respect unto the Duumvirate, not the head. 28. Too much study brings forth madnesse to be felt or perceived first in the stomach. 29. An error of the Schools. 30. By the Maxim of the Schools it is contended against the Schools. 31. Sleep is from the Midriffes. 32. A remedy of Opiates. 33. Vesalius carps at Galen. 34. Of what sort the state of innocency was. 35. That the first conceptions are badly said to be those out of our power. 36. A power of remembering in the Scull, and others elsewhere. 37. The memory of the mind is divers from that of the imagination or phantasie. 38. The lustful, and wrathful seat of the Schools. 39. The leasures of the Spleen. 40. The Head follows the Midriffes. 41. A stupefactive virtue. 42. The Stone-vessels or Cods. 43. Tickling or provocation to leachery is not to be attributed to the kidney, or reins, but to the stomach. 44. That a frail or mortal life hath entered, and is established, where the soul also is. 45. The mouth of the stomach is the center of the whole trunck of the body. 46. What it may be to have carried the Messiah in his loynes. 47. A remedy for a woman in travel. 48. Judiciary Astrology falls to the ground. 49. An external Spleen, what virtue it may have. 50. Why a woman at the time of her going with Young, is troubled with wondrous concepts. 51. The mind doth not become mad. 52. Splenetick concepts. 53. Curable, and desperate diseases, which they may be. 54. The natural endowments of Simples. 55. Conclusions deduced from an ignorance of the foregoing things. 56. Sleepifying remedies do not heal mad-

madnesses. 57. The Lydian Whet-stone for a Physitian, in madnesses. 58. An objection of those that are ignorant or skillful. 59. Fatness limited. 60. The Majesty of the Duumvirate is to be admired. 61. Resistibility or a capableness of laughter, what it is, and whence it happens to man alone. 62. The dominion of the Duumvirate over the Lungs. 63. The original of Spittles. 64. The virtue of Sulphur is determined. 65. Why the Stomach commands the Lungs.

IT is a saying of Hipocrates, In whom a vein doth strongly beat in the part about the short Rib, their minde is presently sick or distempered: For the Artery of the Spleen is most frequent, yet the Pulse thereof is not manifest, as long as it is in good health, and doth rightly imagine: But when it is rashi, it presently, with a strong pulse, even into the left ear, being also oft-times audible by the fitters by, denounceth madneis: But that thing is manifest in a thorn imprinted in the finger, whose pulse before unknown, is presently after, before the swelling of the finger, stirred with a troublelom and hard beating.

Therefore, madneis is denoted to proceed from a thorny spleen. The same old man hath placed black choler in the Midriffs (For the name of the Midriffs, doth sound, that the stomach doth undergo or supply the room of the heart) and from thence he presageth the Falling-sickness, if it shall get into the Body; but madneis, if into the minde: Therefore he drawes both weakneses of the minde out of the Midriffs. But they doe especially flourish, where their occasional cause is near at hand: And so the Schools do testifie, where the shop of madneis, layeth hid, that there also in health, is the seat of right judgement; according to the Maxim; The function of the same part is viciated, the function whereof in healthy persons, is sound, and on the contrary.

For all madnesses (except the Sisters of sleepy evils) do undergo watchings: As a sure Argument, that sleep, the drowfie evil, watching, and madneis, do live in the same Inn: Because sleep, watching, imagination, dreaming, are powers conversant about the same subject, and are made in the same Organ and Inn. I confesse indeed, that sleep is after watching; but that doth not argue a variety of the Inn the subject: For it is not to be doubted, that in a moment every operation of the minde doth cease by hanging, &c.

Therefore if the Head should be the proper place of the Imagination, the operations of the minde should remain, which notwithstanding do perish, presently after light is denied from the lower parts.

Galen proposeth ashes of burnt Crabs, against the madnesse proceeding from a Dog: which madneis rageth in the desirable or lustful faculty, or in the fear of liquid things; From whence the name of *Hydrophobia* is given unto it: Therefore madneis by a Dog, layeth in the part of the desirable power: For neither is the *Lixivium* of Crabs fit to be brought unto the brain: For nothing goes thither, which was not first transchanged in the stomach, neither doth it go to the fifth, or sixth, but through the first and second digestion: Therefore that madneis is by intervals, to wit, the Cup being offered, it rageth into the desirable faculty; but none hath dedicated the lustful power of drinks unto the Brain: Therefore when a mad Dog bit the finger of Dr. Bald, that poyson crept from the finger into the stomach, as the chief Instrument of the sensitive soul; as also to the Spleen, bending about it: whither the Remedy of that *Lixivium* creepeth, as it is the subject for the Hypochondriacal passion. But least the Schools should detract from the dignity of the Brain, they grant that madneis, to have indeed its bound [from which] in the Spleen; but the bound [to which] they will have to be within the Brain: Wherein they say nothing that is excusable: For although the doubt doth cease at least for a time: it is sufficient, that the first motion of the viciated phantasie be in the bound [from which]. They will answer with the more speed, that that humourable and occasional cause in the Spleen, doth not accuse, that therefore the framing of Imaginations ought to be made out of the Head: But I will presently make that by degrees manifest by the strength of many Arguments.

Peter Bor, a Christian, in his Annalls of Belgium, relates, that in the year 1564, at Brussels, a Sow brought forth six young ones, the first whereof (for the last in generating, is alwayes in bruite Beasts, brought forth first) had the head, face, arms, and legs of a man, but that the whole Trunck of the Body, from the neck, was of a Swine: For there was no doubt but that the Mother was a Sow: And therefore, the heart, Spleen, and also the other Organs of the Vegetative Soul were like to the Mother: Therefore although it had the head of a man, yet it

had onely a sensitive soul. Indeed a Sodomitical monster is more like the Mother than the Father.

So of a sheep the mother, and a He-goat the Father, a Lamb comes forth, which besides Wooll and tail, hath his other parts like a sheep. So a Mule, his Father being an Ass, and his Mother a Mare. And so a Horse of a Bull and a Mare.

Lastly, in seven Conies, from their Father a Dormouse, and their mother a Coney, nothing besides their tail was like unto the begetter. If therefore that monster had the soul of a swine, therefore the soul follows the condition, not indeed of the Head, but of the inferior members: And the very prerogative of the phantastical soul inhabits in the Duumvirate (although the Head be a part which is the conductresse of conceits formed in the lower parts) for it is in the Center, and very middle of the Body.

8 For I have demonstrated elsewhere, that the Spleen doth inspire a digestive Ferment into the stomach; that is to say, that the Spleen is the beginning of vegetation or growth; But that the vegetative power belongs to the sensitive soul, that is, unto the Duumvirate: For truly, there is not a vegetative soul singly by it self; but it is a vital power imitating the soul.

9 But the Young is grown before quickning, onely by the influx of participation from its mother, so long as it is as it were an entire part of her; but presently after quickning, it lives by a Kirchin of its own. And therefore there is onely a sensitive soul in bruits, the which, because it is also in a man, and the minde is fast tied unto it, therefore the conceits of the soul, are first in the seat of the soul, which although perhaps they may be refined in the head, yet they do not deny their fountain, yea, although they should be a new stamped in the brain, yet they have not need of a succession of motions from the soul into the head, as it were a Pilgrimage for this purpose: For the commands of the will are far more grosse than those of the conceptions; yet the command of motion being scarce conceived in Fiddlers, their finger doth most swiftly execute that command.

10 Therefore the actions of government do beam forth on their objects, with an un-interrupted light: And therefore the discourse being suited unto its own shops, doth receive Lawes on both sides, and likewise appointeth others: otherwise, the apparitions of the brain are loose and confused, if a hurt of the Spleen doth interpose: which is manifest in halting, in a feverish doatage, in those that are diseased about the short Ribs, in outrageous or mad, Apoplexical, epileptical, &c. persons. From whence it sufficiently manifesteth, that the brain doth obey the doating Duumvirate.

11 For it is most agreeable to truth, that the wisdom of flesh and blood (which is the sensitive soul) hath its situation in the most sanguine or bloody bowel of all: Therefore it is read in the holy Scriptures, that the soul and the life are in the blood: For if thou dost mark the bowel of the Spleen, and its substance, thou shalt perceive its substance to be blood newly made clotty, covered with a skin, and to be enriched with so manifold a co-weaving of veins & Arteries, that there is not another bowel in the whole Body, which by about a tenfold quantity, is so rich in so many Arteries: But the Brain hath scarce a vein, or blood, or but sparingly in its whole lump. The Coats indeed, or covers of the Brain, have their own small veins: And although, there be in the bosom of the Brain, an Arterial Vessel fit for the transpiring or breathing thorow of Spirits labourated in the heart; yet the lump of the Brain is almost wholly void of blood: It is no wonder therefore, that the Spleen doth form strange Ideas, and strange conceits, under a forreign guest: The expulsion of which guest, while the spleen doth meditate of, it stirs up a strong pulse, even as a Thorn driven into the finger, doth shew a present and hateful guest.

12 For I have observed seriously, the eyes and countenance of one distempered about his short Ribs, to be writhed presently as oft as he would relate to me his foolish and first conceits; whom while from the beginning of the doatage I would interrupt; presently also at that very moment, his eyes and countenance did return into their former health. I did wonder in a fellow-feeling, that so swift an innovation of the whole countenance, so often a repeated one, and so great a one, should be propagated by the action of a lower government, into the tower of the brain. Furthermore, for neither are rude and uncomposed conceptions onely from the spleen; but likewise also, the understanding of the brain being laid asleep under Dreams, we must not despise the light of gifts, it reacheth to the minde. *Act. Ap. chap. 2. v. 17. And it shall be in the last dayes, that I will poure out of my Spirit upon all flesh, and your Sons and your Daughters shall prophesie. And your young men shall see Visions, and your old men shall dream Dreams. To wit, significative ones. Nighr unto night sheweth knowledge, if the Watchmen do fore-learn to withdraw his thoughts from things or affaires, place, and motion.*

I have also not undeservedly affirmed, that the first concepts of disturbances are felt in the Midriff's ; Seeing that if a sorrowful message be brought unto a hungry man, his appetite presently perisheth : therefore the Message and Appetite do light into one and the same Inn. 13

I have also taught elsewhere, that the stomach of the Liver, is not some notable hollow-ness spreading within its own bowel ; but that the Mesentery veins themselves are the sheath of sanguification or blood-making, into which the Liver doth beam forth the first breathing-holes of sanguification : But that the stomach of the spleen is the stomach it self, which it therefore nourisheth by embracing, that it may inspire into it the Vulcan of digestion : yet there is another and proper stomach of the spleen, admirable for the manifold winding of Arteries, wherein the Milt doth cook for it self alone : Under which digestion, if the least error rusheth on it, the spleen ceaseth in digesting, and denies the ferments due to the external stomach : which thing is evident in a Fever, while as instead of a sour digestion, burntish or stinking belchings do come for witnesses, which are emulous of a certain putrefaction. The Brain also, through its own unsensibleness, hath relation to the Milt, as also the Coats of the brain unto the stomach it self, in this respect : For the action of the stomach is powerful, and hath in it the Vicarship of the heart, and doth execute the offices thereof, against the will of the Schools.

For neither doth the spleen by an unbroken, vital, and wealthy number of Arteries, flourish in vain, in its own conceptions ; but as oft as it makes its concepts drowsie through the delights of another nourishment, it grants a truce from its work, that is, sleep : which if they shall be lesse perfect, or troubled by the too much care or anguish of the stomach, it also produceth confused Dreams. 14

No Physitian hath hitherto doubted, but that the Ephialtes or Mare is stirred up from the Midriff's : for it comes for the most part, through the taking of a larger supper of the more hard meat ; or the stomach otherwise labouring : and therefore that happens, not indeed to one laying on his right side ; but onely sleeping on his back with his face upward, or at least on his left side : Indeed when he hath almost slept enough : For they feel or perceive obscurely, they discourse, they think they do touch with their hands, and see with their eyes ; yet they are not able to move themselves : For oppressions are perceived to be heard, and felt : otherwise, in sleeping, others (even sick folks) do move themselves freely : For the Stomach is loaded and burdened, and the concoction thereof is not yet finished, and therefore it happeneth to those that lay on their left side, to wit, which way the mouth of the stomach is wrested : From whence it becomes first of all, evident, that the stomach also doth command the motion, and especially that in this, it doth govern the sleep, dreams, and also the motion : For the dreams of the Mare are almost always the same, as also the impotency of moving, as long as the stomach being thus ill affected, is stretched forth in sleep. 15

For the Schools do assign the causes of the Mare to be grosse vapours invading the thorny marrow : And indeed they are carried into vapours, by reason of the momentary solving of that distemper : For if the sleepers are forthwith awakened, the Mare also presently ceaseth : And so those vapours ought to cease at the will of the awakener. In the next place, I hardly hear, that grosse vapours should be accused in many or most causes of Diseases. 16

I hitherto confess, that for fifty full years I never as yet saw a grosse vapour of distillations. There are indeed corporeal exhalations, in which a volatile matter is sublimed, and doth climbe to the sides of the vessel : So indeed out of Sulphur, Orpiment, Woods, Arsenick, Sal-Armoniack, Camphor, Urine, and likewise from Mercury, Lead, brasse-Oar, Brasse, &c. grosse smoakinesses do ascend upwards : but vapours, to wit watery ones, I never saw or knew to be grosse, unless among University-men, who are ignorant of vapours : yea, however grosse they should be, they should at least, both loose their grossness at the pleasure of the awakener, and the heat which had stirred up those vapours should presently be stopped : Both of them surely, ridiculous things. Again, they conjecture the marrow to be affected, by reason of motion denied in the Dream : And so every affect of the marrow, and every stopping vapour should cease at the will of the awakener ; which is alike full of frivolous rashness. But how shall one laying with his face upwards, send grosse vapours out of the stomach into his loins, and the marrow enclosed within the turning joynts, and covered with membranes ? to wit, whither, in another place, they say, that not the more thin windes do pierce ? especially because such a Scituation of him that layes down, should of its own nature, rather banish vapours out of the stomach into the bowels, or should carry them upwards thorow the stomach, into the Navil, than downwards unto the marrow being shut up and loaded with the bowels. What community passeth betwixt the speech with the thorny marrow ? or why shall grosse vapours out of the stomach, desire onely the back-running sinews ? For the Mare doth 17

not onely cause a hearing of inward whisperings, and granteth to discourse, also to fear; but also external, true, and appearing objects are heard: But he cannot move his tongue; how much soever others may speak in time of dreaming. Do the Schools perhaps think, the motions of the tongue to be made by the thorny marrow? Therefore those grosse vapours shall be far different from dreamy ones, they not hindering the use of motion of the tongue, yea of the whole Body: For while they apply themselves to the sinews that they may afford the causes of unmoveableness, the Schools themselves become dumb and unmoveable: While they shall never understand what they say, as neither, after what manner those grosse (that is impossible vapours) shall pierce the stomach, bottom of the belly, hollow vein extended through the back, with a beating Artery its companion, and likewise the ligaments of the turning joynts. And how those things shall be silent, appeased, and cease at a moment, if haply he be awakened who suffers the distemper of the *Mare*. Surely they had more rightly learned the action of the government of the Duumvirate, to wit, that an impediment brought on the stomach in its vital government alone, doth without vapours, or Truncks, trouble the Brain, doth vitiate the sinews, and first conceptions, as it interrupteth the comforts of the spleen: For so it happens, that those who have the Apoplexie and Palsey, do eat, hear, and sleep, &c. yet that they cannot speak: For the Schools do accuse the back-running sinews to be stopped: Why therefore shall not the *Mare* have regard to these sinews rather than to the thorny marrow? Why do Remedies for the Duumvirate, help those that have an Apoplexie; a giddiness in the Head, that know not how to go and speak; those very Medicines I say, being as yet present in the hollow of the stomach; but are unprofitable to the back-running sinews, and head? Hath a Pie perhaps those sinews stuffed together before speech? Shall a Cow which thrusts forth her tongue moveable into the nostrils, have her tongue bound, and doth she want back-running sinewes? Or else she shall have them in vain, if they are perpetually and naturally stopped.

- 18 A certain voluntary command is brought down from the Head unto the sinews of the tongue, that is denied unto four-footed beasts; but not unto some Birds: Likewise that thing, not at the first turn, but by degrees, through an accustomed going: But he that hath an Apoplexie, doth not put this command into execution, because he is dismayed or astonished almost like a four-footed beast. Indeed the conception of an Asse, God permitting it, once passed thorow unto his tongue: Not indeed, that the Asse was the Instrument of the Angel: For then he had spoken the iudgements of God; but not his own conceivings, neither had he complained of his stripes: From occasion of the Asse, I will speak my own.

- 20 In the year 1643. the day before the Calends of the 11th month called *January*, I sate beginning to write in a close Chamber; but the cold was great, and I had an earthen Pot or Pan to be brought, with burning Coals, that I might sometimes comfort the cold stiffness of my fingers. My little Daughter comes unto me, who as soon as she sented the hurt or offence, withdrew the Earthen Pan, and unless she had chanced to come, I being choaked, had perished: For I presently felt about the mouth of my stomach, a fore-threatned swooning; I arose from my Study; while I would go forth abroad, I fell like a straight staffe, and was brought away for dead: For there was a two-fold affect, one of the bruised hinder part of my head, which filched away my tast, and smelling, but did over-cloud my hearing: The other was a sounding affect stirred up from the stomach: For in the first dayes, my Head turned round with giddiness, as oft as I looked on one side, much more if upwards. I thought that that beset me from the stroak of the fall, with the naked hinder part of my Head suddenly, and from my whole stature, on a hard stone: But by little and little, I was better assured, and I for many dayes, revolved all things within my self. I knew therefore at length, that my giddiness proceeded from my stomach, and that it was there nourished by the same Root, from whence the swooning had proceeded: For some meats did promote that my giddiness, and specially about the evening, to wit, while they were not as yet cocted; and so that the same thing happens in the *Mare*, from meats well nigh concocted. I had remembred also, that as oft as I had passed over the Sea in time past, although I was in due health, and was very much given to eating; yet my Head ran round and staggered for many dayes after, until that by a gentle vomit, I had shaved away the filths out of my stomach, whereon that whirling Idea was imprinted: For I certainly found, that my giddiness did not onely accompany the offensive meats; but moreover, almost an hour of finished digestion, and that food being taken, and moderate Wine, my giddiness was alwayes presently mitigated. And moreover, although I had long after that, escaped wholly free, nevertheless, at the eating of some meats, I suffered a relapse about the evening: Therefore (as they are wont to say) I believed experienced *Robert*, that all giddiness of the Head doth climbe up from the parts beneath, without a vapour or smoak; but that the Head doth hear-

hearken to the stomach, through the government of action alone. And which is more, at the time of the giddiness which threatned my fall, all discourse began to reel or wheel about; which presently after the taking of wine, was restored: And so I comprehended, not indeed the meat left in the stomach, but the first fuel of my swooning, to have received an hurtful impression from the stain of the more unworthy food; from whence by the Sulphur of Vitriol I was also made free.

I have elsewhere explained the Pylorus the Governour, together with his dignities, whereby 21 it is manifest, that the stomach is on every side, and in every corner, the seat of the soul: Yet so, that as the mouth of the stomach is chief and bears rule over the head, and chief faculties; so also the Pylorus commandeth the lower parts: For I have observed the more cruel Colick, sometimes to passe into a Palsie, but at another time to have brought forth a Convulsion of the hands, feet, arms, and legs. I have also seen the griefs of the stomach, by reason of the sharpness of pain, to have taken away all motion, and to have caused an affect like unto a *Tetanus* or straight extended cramp: which affect, our Countrey people have called (*Gefchor*) an in-darting, as if it were suspected or overlooked, and sent in by witches. And the *Ischiatick* passion or *Sciatica* doth oft-times accompany those in-dartings; whereupon I have seen cuttings of veins, likewise solutive medicines, Clysters, Emplaisters, Oynments, cauteries or searing medicines, and the like, administered, and with an unfruitful event: For theirs were mocked endeavours, who would establish a remedy unto the consequents or effects, or products, and would passe by the Springs issuing from the Pylorus: For I have observed the four lesse hot-seeds, for the most part to have appeased the storm; because they succour the most inward Archeus and household remedy of the bowels, and appease him being wroth. Wherefore I admonish the Reader, that he take good notice of the stumblings of the Schools, who impute it to their Catarrhs and defluxions of phlegm, for a sacred anchor of their ignorance.

But surely an History is worthy to be noted: A man of fifty years of age, that was burst, suffered a Rupture of his Entrails through the carelesness of a Bond or Trusse, which presently encreased to the bigness of ones head, and waxed hard after a wonderful manner: He renewed hot fomentations of milk and Cows dung, all night, and they tried to put it back; but in vain: For truly one only hard swelling had become continual or firm, like an earthen pot, and took away the hope of a possibility of its going back through an hole that was ten times less. Therefore we offered him a draught of wine being once boiled with seeds bruised, (to wit, of Anise, Caraway, Fennel, and Coriander, of each a like quantity) and presently the hardness was made soft or tender, and the burstness was suffered to be thrust back: wherein the hardness, with so great a swelling, is stiffly to be considered; the which indeed owed not their existence unto wind, nor to dung; but hardness is subject to the Pylorus. And therefore it seemed not to be a body co-touching from the passages of the *Ileos*, but it seemed one only continual body: And then, the *Ileos* did not fall on that which fell down, neither rushed it of its own accord, forward, into so great an heap; but it was thrust forth thither by a more powerful force of government. Again, it doth not appear in women with so great a swelling, and so great hardness: Wherefore the injury of the stones stirs up the Pylorus into fury: And therefore the whole remedy consists in the mitigation of his fury. But I have seen some great men to have miserably perished, being seduced with an hope placed in Physitians, locally, according to Galenical absurdities.

Furthermore, hence I return unto the Duumvirate, wherein the soul sits. For *Plato* hath 22 determined the heart to be the seat of the soul; as well in a man, as in brut beasts. But the Galenical Schools do therefore attribute all understanding, and madness to the head, and they think that they are confirmed by the Church, which baptizeth the head, not the heart. Neither do the Schools regard, that from the heart do come murders and adulteries. But the Common people are of my opinion, which for the vital beginning, or seat of the Soul, do shew with the hand, the Orifice of the stomach, as oft ss they are pressed with straights, to wit, as well with the anguishes of the body and life, as with the afflictions of the mind. For I consider in the Young, a sensitive faculty to be at first hidden in the bowel dedicated to nourishment, and that it is the knowing of things helpful, and hurtful. Next in an Infant, and a child, more distinct conceptions to be formed by degrees: And therefore the Brain and its Clients are by little and little moved, that they may obey the principiating concepts: But the Soul hath not therefore receded from the bowel which was at first made chief over growth. For all spirituality doth respect the sensitive soul: For the head is baptized, because the sensitive brutal soul being by Organs, there placed for a Spectator, first deceived *Eve* in the same place, and death invaded. For the Schools do on the one hand scoff at the words *Cardialgia* and *Cardiognus*, as rustical and barbarous words; but afterwards, on the other hand,

hand, they have viewed swooning, so immediately to spring from the mouth of the Stomach, as if it did wholly consist in the same place, to wit, did proceed from thence, and were there also presently restored by sweet smelling or spicy injected liquours: but they have taken notice in swooning, the understanding, sense, motion, and together also the pulse to fail; and so that it climbs suddenly out of the Stomach from the functions which are ascribed to the head and the heart together; yet without a deeper diligent search, they have attributed the whole constitutive temperature of the life, understanding, and soul, unto the head; not being able to conceive, that the beginnings of life do belong to the Duumvirate, although they should be put in execution by subservient Organs or Instruments. As if the beginning of motion were in the muscles, and bones, because they are moved!

- 22 A certain Lawyer had taken two drams of Henbane seed bruised, instead of Dill-seed, which had been prescribed to him in the Colick; but he presently became so mad thereby, that he could not utter an intelligible word; and so mad, that I have not seen any thing more blockish and foolish: He sat indeed nigh the hearth upright, but wholly an unsound and mad blockish man. Therefore by that which provoked vomit, he recovered within lesse than half an hour; and there had been medicines snuffed up to purge the Brain, sneezing-medicines, and a cap to the head, and also Epithemes or things laid on the heart, in vain. And moreover, whatsoever of that seed he had drunk through the error of the Apothecary, which was as yet in his stomach, and wholly involved in a musilage, that he presently cast back by vomit; neither could any thing of it fume up from thence unto the head, in manner of a vapour; Yet he was wholly without hurt, and raging mad, because he understood nothing; yet the motive functions of his head stood strong. From whence I collected, that the intellectual powers were dashed together in the Duumvirate. But I had him a guest with my self in a dinner.
- 23 For those that faint, do affirm that they feel the fainting to be threatened in the midriffs, more swiftly than by all the activity of vapours, and that every conception is suspended without sleep; whence every one that is not stubborn, will clearly see the first conceptions of the soul to be formed in the Midriffs, and those being taken away, that the light of understanding doth also presently fail or die: So also a timorous person in a sudden terror, feels the token of fear in the mouth of his stomach, if any great noise (suppose the high stroak of a gun) be suddenly and unthought-of awakened, which doth prevent and cut off all action of discourse.
- 24 Therefore, if the maxim of the Schools be true, that from the hurting of the actions the part hurt may be made known; also the seat as well of madness, as of swooning, and of every defect, may be found under the *Diaphragma* or midriff.
- 25 For therefore mad-folks are most able to endure hunger and thirst. For I have seen in the year 1615. at *Alost*, a Girl of nine years old, wanton enough, the little daughter of a Steward to an Hospital, which now for three years space, had eaten nothing at all, unlesse that perhaps every eighth day, or above, she drank about four spoonfuls of pure water: For she being at first notably affrighted by thunder, had ceased to eat. For it is without controversie, that affrightment, sorrowful things, &c. do in the first place or chiefly affect the midriffs, and presently take away all hunger. Indeed they do sensibly reflect themselves on the stomach, neither can they therefore be referred to the head, because none of those perturbations is felt to aim at or smite the head and heart, unlesse the mouth of the stomach be taken for the heart. Neither is it also likely to be true, that if the head should first apprehend and feel sorrowful things, and sudden fears, that it should presently dismiss them into the stomach, and not rather unto the sinews over which it is more intimately chief: For besides an absurdity, it would also be a cruelty, to vex the part not subjected to it self, and to leave the subjected part safe: For a greater authority of the stomach over the head is beheld, than of the head over the stomach, which I have above already demonstrated by many arguments: For truly, drowiness, sleep, watching, doatages, and whatsoever symptoms are wont to be attributed to the head, are abolished by Stomatical remedies, but are not mitigated by Cephalical ones, or head-remedies: For hence is the Proverb, *Oh head, that art worthy of Hellebor*: For although manifold vomitive medicines are not wanting, yet a peculiar virtue is attributed to Hellebor for a mad brain: Not indeed, that the poisonous and hurtful quality doth reach into the head: For truly, Hellebor being present within the stomach, and that being afterwards cast up, Convulsions do happen thereupon, such as I have noted above, from frettings or wringing in the guts. Therefore black Hellebor easeth madnesses before other vomitive medicines commonly known, because it unloads the ancient fevers of the midriffs, and unloads the Spleen: For that, nothing strikes the head by arteries, or vapours, hath been already, fully, and by many arguments demonstrated above. Therefore the aforesaid diseases, and their remedies have regard unto the Duumvirate, neither do they affect the brain, unlesse by government, or by a secondary passion: For Students do inordinately feel a fulnesse within, compo-

fed of giddiness, and anguish, with sighs, and they point at the mouth of their stomach with the hand : But from thence they accuse the pains of the head. But if at length they are urgent through continuance, they perceive about the mouth of the stomach, a certain swooning, and afterwards their imagination to be disordered, or turned upside down: And therefore unlesse they do speedily desist from studying, they keep a foolish madness returning by intervals, all their life long. Therefore where the hurt is felt, there is the blemish of the understanding, and the soul doth principally reside.

The Schools on the contrary, do contend, that the Spleen is the sink of black choler, and that it unloads it self of its own dungs, into the Stomach : and that which I call the ferment of digestion inspired into the Stomach, that the Universities will have to be the excrement of a pernicious humour, and so, the digestion of the Stomach to be stirred up from such dross. But after that I certainly knew that there was no black choler in nature, it was easie for me to depart as well from the humours, as from the use of parts delivered by *Galen*, and to forsake the black cholery Schools; concluding by their own Maxim; *If the cause of madnesse be in the Spleen; therefore the Inn of the judicious understanding is due to the same place* : If there be a hurt action of the same faculty, function, and organ, wheteof there is a sound one, and on the contrary.

Whence also I further concluded with my self, That the somniferous or sleepifying power is to be placed in that part whose office it was, first to frame watchings, and vain dreams, where also phantastical apparitions are stirred up in watching: from hence indeed a hungry man dreams of feasts : And Fevers, before that they end into doatages, sleeps with labour are first made : and then come nights without sleep, and at length doatages ; which things do testifie the Duumvirate to be badly affected, and that that is the workman of sleep and dreams. For old men whose coctive faculty is the weaker, although their venal blood be more scanty, yet with a sober supper they sleep the better: And younger persons after a sparing supper do most difficultly rest ; yet none hath ever thought, that old folks do send the more vapours to the head, if they are abstinent from a small supper.

Yet drowsie sleeps, as well disease ones, as artificial ones, or those of Opiates, are most excellently vanquished by *Lixiviums*, which notwithstanding, are by no means acknowledged for remedies of the head: For he that hath a desire to make water, dreameth that he looseth his bladder, and pisseth at a corner (for it happens that some, by the same consent, have much bepiised their bed-cloaths) yet the consent granted in his sleep to be withholden: For although the brain do fully sleep throughout the Organs of all the Senses, yet the discerning faculty of the sensitive soul is not laid asleep in the part about the short ribs : For we do often feel sleep in the eyes, but none about the stomach, and thereupon, that nights do almost slide away without sleep. Also two having drunk, and being drunken with the same wine, do notwithstanding declare divers conditions: For this man becomes devout, another trips or dances, a third scolds or brawls, &c. also the wine as yet existing in their full stomach. Because the phantasia of the Duumvirate doth vary its conditions according to the peculiar affects of the sensitive soul.

Galen hath feigned a certain folding or small net of arteries in the bosoms of the brain; which thing, Anatomy hath not yet found: And therefore *Vesalius* doth oft-times convince *Galen*, that he never saw an humane dead carcasse dissected, how great Volumes soever of Anatomy, he hath set forth: And therefore it is to be suspected, that he wrought the same word for word out of another, who had dissected an Ape, as the same *Vesalius* proveth ; because it is that which hath the aforesaid folding in its brain. And however *Galen* was even rashly deluded in that folding ; yet he determined the judgment to be in the head, by reason of that folding that doth not exist. But are not the beginnings of imaginations rather to be drawn from the folding of arteries in the Spleen, from the *Saturn* of the Spleen (whence *Saturnus* Kingdomes are wished to return, in the innocency of the first conceptions?) That the the Spleen may communicate the letters, or answers of its own pleasure to the brain, by the influence of government, without vapours of trunks, and that in an instant, even as I have above demonstrated by the readineses in Fiddlers.

For our first parent was not to be presumed ignorant and stupid before the fall; for he was he who put proper and essential names upon all living creatures : but the state of innocency was guiltlesse about luxury, which is covered with the ignorant word of nakednesse : For there was not yet a sensitive soul; and so the immortal mind beholdingly understanding all things in its own seat, looked reflex on it self, and in the image of God, did intimately know within it self the living creatures put under its feet : But after that man entered into the way of corruption; as if it were fire out of a flint, so the sensitive soul after sin, the Creatour co-working, bewrayed it self, and from hence the conceptions of the mind were obscured.

But

- 34 But such conceptions as are modern, in the first place, (while I say the first concepts or first forces to be formed in the midriffs) I do not understand them to be the forces of the wrothful power, which the Schools have falsely denied to be in our power, as if they were plainly guiltlesse of crime: But I consider now and then, through discourse, that there is a thing altogether ponderous, or weighty in the concepts of the soul which are felt to be formed about the mouth of the stomach, and in the mean time, the mind sends away the same conceptions unto the head, to lay them up, it being as it were the sheath of the memory. And then, the memory remembers indeed, some conceptions committed to its trust, but it hath forgotten the distinction of the same: Therefore also the soul cannot any more form the same conceptions in its own bride-bed, seeing that the memory hath lost the same. Therefore those are the first concepts, the first motions, and forces of motions, and the which are no longer in our power, to wit, which the soul hath not in its pleasure; neither can it forge the same again, if they are not again produced to the view of the soul: And so from hence they are called the first, because they are but once only forged, not by the pleasure of the will, but of the understanding alone; which unlesse they are kept in the brain, or case of the memory, they perish, until perhaps the soul doth sometimes of its own accord form unto it self the same concepts: Then indeed the memory being mindful of its fall or slip, doth by calling
- 35 to mind, rub hard or renew with grief in the mind, as if it should say, Lo, these are the conceptions which thou didst require of me Memory, and I had then lost the same.

Whence I see, that although the soul doth sit in the midriffs, yet that it hath placed the power of remembring in the head, and the other of willing in the heart; and so that both these are in this life, frail, and companions of the sensitive soul, which although it be centrally the bond of the mind in the midriffs; yet nothing hinders but that it hath its own powers distributed or placed by Organs or instruments: No otherwise then as the visible power is in the Eye, the tasting power in the Tongue, not elsewhere, and the touching power almost every where: For seeing they are the frail and beast-like powers of the soul, the soul it self hath after the manner of bodies, subjected them to bodily rules.

- 36 The mind after another manner, is wholly undivided, and contains its own memory and will under the unity of understanding: but they being after a wonderful manner wrapped up together, and lulled asleep under the bond of the sensitive soul, unto which the mind is bound and co-knit, it feels a law every where resisting its own law, that is of the mind:
- 37 For the Schools do assign the desirable or lusting power to the Liver, but the angryable or wrothful power to the heart: yea, if they could find more bowels, they had given separated Inns prone to disorder, unto all the particular disturbances of the mind; when as otherwise, the same disturbances are felt to be exceeding hot in the Duumvirate, and that in their first motions: And it is an absurd thing to separate the desirable and wrothful power in their seats: For while any one resisteth a thing desired, if any one be angry, it is even one and the same power: For neither without injury of the other powers are the two aforesaid ones sequestred from the Bowels. For fear, love, desire, hatred, drowfinesse or unaptinesse, and joy, have not divers stables: Because all such powers, are of the one soul, but not dis-joynd household-servants of any kind of perturbations. For truly, when the soul is angry, and while it rejoiceth, or loveth, although it be diversly affected, and decyphereth as it were divers masks in Idea's; yet, this is not the office or work of the Organs, but the passions of the one and only soul, which because they are the works of the flesh, and the interchangeable courses of the concepts of the sensitive soul, they are framed by the soul in the seat of the Duumvirate. Therefore the Spleen being by intervals intent on its own reflexions, delights, and remedies of wearinesses, filcheth away a third part of our life by sleep; and as it brings forth dreams in sleeping, so waking, it propagates the knowledges of conception, they being a little distincter, and lesse drowfie.
- 38 Truly, unlesse the Lord do nourish us with his grace, we dream throughout our whole life, wholly by a confused concept; yea, neither do we perceive that we do understand, while the light of the Spleen being troubled, and ceasing, the brain receiveth the first concepts of Idea's, scarce any longer worthy ones.
- 39 Therefore sleep is stirred up in the Midriffs, and doth notably manifest it self in the Head, and so the Head doth not blush to bring forth at the content of the Midriffs. And therefore sleeps are the be-lyed parents of vapours and stoppages of cold: For there is in the *Sulphur of the Vatriol of Copper*, a stupefactive, sleepifying, and hot virtue, and sweeter than honey, which in Opium is bitter: whence it becomes easie to be seen, that there is not a privative stopping, and cooling virtue (especially after feeding, and drinking of wine) but a created faculty that over-tops watching in the Spleen. So also some poisons do alienate the mind, and

its own native Imaginative power, whereby they do dispose of ours at their own pleasure (as in the Apple of *Adam*, in the Spittle of a mad Dog, the pricking of the *Tarantula*, in *Jusquiamus* or Henbane, &c. So also stupefactive medicines do withhold the Spleen from a working exercise of serious Visions or Representations dismissed into the Brain, besides the case of the memory, by virtue of a soulified or quickned light of government: For indeed, God formed the last top of Creation, not of the Skin, blood, or grease of the man, but of a Rib about the Spleen.

Also the Vessel or Kernel assistant to the stones, on the left side, is not derived into the stone of a man, even as on the right side: For truly, one is taken out of the sucking vein before the Kidneys, but the other out of the Trunk of the hollow vein it self: Not indeed (as *Galen* being deceived, otherwise thought) to beg a tickling of the seed from the Salt of the Urine; but that the vessel of the Kidney might be proper or natural to the seed: For who doubteth but that the salt of the Urine, or of an excrement, doth not take away all fruitfulness of the seed: Especially if a small piece of the hair of a Horses mane or tail, how small soever it be, be thrust within an Egg-shell, it extinguisheth the hope of a chick? *Galen* being wholly excrementitious and ignorant, who thought our Beginnings or first principles to want a tickling, and begged also the last compleating of fruitfulness from excrements: Therefore at the beholding of this mans ignorance, I will moreover add a Paradox.

The Schools ascribe *Venus* or carnal lust, and the tickling or provocation to leachery, to the Reins or Kidneys; and *Paracelsus* and all Antiquity subscribes thereunto: All of whom (I being silent) Fishes themselves, and Birds do presently convince of error: For Birds do want Kidneys, and Urine, and Birds are most lecherous: I at least do believe, that *Venus* is the office of the sensitive Soul, and so that it is to be placed in the part wherein the first motions, also while we sleep, are made: Because nature was in nothing more careful than in the difference of Sexes: And so from the beginning of the pouring of the Young, she is straightway busied in the Instruments of *Venus*. And so perhaps, this, even the Antients would imply, when as they have ascribed the Spleen, the first paternity, to *Saturn* the first of the Starry Gods. Yea therefore they deciphered their Fauni or Country Gods, and Satyrs (a most lecherous and scurrilous kinde) in the figure of *Saturn*: For I have alwayes abhorred it as a filthy thing, to have placed *Venus* the greatest Star next the Sun, in the Kidney the sink of Urine.

Truly Birds in this respect, should be far more noble than us. Pollutions also or defilements of the seed, do not happen in time of waking; because sleep is the effect of the spleen, and to this, after delights: Otherwise, what common intercourse is there between the Reins and sleep? do we not oftner make water waking than sleeping? As (according to the Schools) sleep doth withhold any kinde of avoyding of excrements, except that of sweat, and unprofitable seed? Surely otherwise, voluntary pollution should be more subject to a waking, than to a sleeping man: But such an excrementitious expulsion issues forth with the sleep of wantonness, that it may be manifest, that there is the same Instrument of sleep, dreams, and pollution, as they are the workmanships of one soul: For as blood-making begins in the veins of the mesentery, as it were the stomach of the Liver; so the cocting of the Sperme or Seed is made in the stones by the spleen: For I remember those that have been stony in both Kidneys, yet to have been much inclined to leachery: But it were an absurd thing that a healthy and lascivious power should remain, or be manifest under a Disease of its own radical Organ: For the Liver being badly affected, a good sanguification doth not arise, neither is there a fit seeing to an eye beset with Sand: Neither shall I ever believe, that the Reins moistening with a continual Urine, and being busied about the expulsion of an excrement, and never keeping holiday, are intent on luxury. Therefore it hath seemed an excrementitious opinion, that the motions of propagating the Species, the Summons's of the vital faculties, and Character of the minde, should be forged in the Stable of forreign dregs or filths.

For the first motions of lust are manifestly felt about the mouth of the stomach, no otherwise than as the late repentances of leachery: For if death entred by the first motions, it is agreeable, that the frail degenerating life, ought in the same place to have radically taken its beginning.

For the Orifice of the stomach, obtains the place of a Center in the Trunk of the Body, whence the beams are most fitly spread upwards, as downwards. But that it is written, that *Abraham* carried the Messiah in his Loyns:

That is unaptly withdrawn from the spleen unto the Reins, from a bowel I say chiefly vital, unto an excrementitious shop and sieve. I have noted also very many who from a Quarantine Ague, had retained their spleen ill affected, to have been very much curtail'd in the provocation to leachery.

46 I have also observed Women in a difficult labour for some dayes, an adventurous or experienced draught being offered them, to have brought forth at furthest, within the space of half an hour: And that thing hath been proved 200 times and more: For surely the Medicine being as yet in the stomach, the mouth of the share is opened, and the folding-doors of the *Osfacrum* are opened in the loins, and the Young is presently expelled: Indeed I have noted the Stomach to keep the Keyes of the Womb: And this medicine I have divulged willingly, for the good of my Neighbour, that she who is in labour, may not hence-forward undergo the danger of her life: But it is the Liver, together with the Gaul of an Eele, being dried and powdered, and drunk in Wine, to the quantity of a Filburd-Nut. The gift of God is in this Simple:

47 That seeing the Woman ought to bring forth in pain, by reason of the envy of the Serpent; God whose Spirit was carried upon the waters, hath filled them with his blessing: He would have the Eele or water-Serpent by his bowels of a sanguifying power, to appease the rigour of that curse. The Liver of Serpents would effect the same, and perhaps better; but in the experiment of the Eele, the event hath never deceived.

48 From this time likewise, the Judiciary divination by the Stars, *Hermes* his scale, and whatsoever is supported by the point of Nativity, falls to the ground. But upon occasion hereof, I shall a little digress: in what part the Young is knit to the womb by the Navil-strings, and without the coat of the Secundines, or the swadling-band of the Young, it hath a substance in form of a Spleen, as *Vesalius* witnesseth.

49 And so it hath as it were an external spleen, to wit, wherein as it were the venal blood of the Kitchin, and the Arterial blood of the Mother is re-cocted (the Spleen in this respect, stirs up in me a suspicion of a more exact sanguification, than that of the Liver; to wit, as the venal blood being there re-cocted by so manifold a winding of Arteries, doth go back as it were from the stomach to the heart: Even so, as Birds, and Beasts that chew the Cud, do rejoyce in a double stomach): At least it is manifest, that that external milt doth command the conceits of her that is with child.

50 For the mothers themselves do wonder, that they are then affected with such unaccustomed conceits, longings, furious frights, and storms of troubles: But it is no wonder to me; seeing nothing is milty or like to the milt, if it do not swell with the properties of the milt: But that is a wonder, that this flesh of the milt is not informed by the soul of the Mother or Young; but that it enjoys a life of its own, being communicated on both sides: For it hath not a sensitive Soul, seeing that it is also, long before quickning: but it possesseth it self in manner of a *Zoophyte* or a Plant alive; such as are Sponges, and also the thicker muscilages swimming in our Sea, which do enlarge, embrace, strain, suck, and shew forth rare testimonies of life being present with them. Moreover, if the poyson of a mad Dog, or a Tarantula do make a madness limited, and that like unto it self; it is no wonder also that this milty lump, is enlightened participatively, doth live ballamically, and move the minde of the woman with childe, with a diverse passion: As well because it performs the office of a Kitchin, as because there are in the things themselves their own vain visions or apparitions; as is manifest in a mad Dog.

51 But besides, the minde of man being the near Image of the most high, wholly immortal, doaterh indeed with the sensitive soul, but is not capable of suffering by a little Liquor; Because the passions of the sensitive soul, do affect the minde, which they cover within themselves, do roul up and co-knit in a bond: The minde indeed properly is not sick, although it hearken to the frailty of the sensitive soul: whence it is made manifest, that the sensitive thoughts or cogitations are from flesh and blood, according to that saying, *For flesh and*

52 *blood have not revealed these things unto thee.* Therefore discourse and conceit is from the milt or spleen, as being a bowel most sanguine of all, and rich in very many Arteries: But I have proved elsewhere, that the conceit of a woman, although it be formed in the spleen, yet that it is brought down for the most part, with a straight line unto the womb, whether there be a Young within it, or not: and therefore the principality of the womb doth war under banners of its own: neither therefore is it evidently seen in its own rest; but onely while according to a wicked pleasure, and fury, it strains, wrings, blunts, choaks, resolves, and looseth its Clients, poureth forth blood, &c. But the Duumvirate doth on every side keep a due proportion of life, and that with so sweet a pleasant tuning or musical measure of the life, that therefore it hath hitherto been passed by by the Schools: But as soon as it withdrawes its government, the strengths of the parts (how chief soever they are) are eclipsed: For so there are faintings, Apoplexies, Epilepsies, heart-beatings or tremblings, giddinesses of the the Head, and madneses. And so indeed, that as the occasional root of which defects, is vo-

luntarily

luntarily consumed, and the circuits and durations of the same do vanish away, even as in the milder Fevers; So also they may be voluntarily silent, that they may forget to return: however the boastings of Physicians do differ in this thing.

For those whose Roots do the more stubbornly cleave unto them, they are the more fully con-tempered, therefore, after another manner, they altogether resist a voluntary resolving, and therefore they wax old, together with it, together with the nourishments of the stomach, and do expect their own relapsing fruits unto the end of life. And therefore an Epitaph of incurableness of these defects not voluntarily ceasing, is now every where read to be subscribed: because, they have hitherto wanted a meet Secret, whereby they may be rooted out: But the Roots of these Diseases, as long as they do affect onely the inflowing Spirit, they produce off-springs proper to their own seed, and Inn: For so the falling-sickness, because it besiegeth both Spirits, it dasheth together as well the faculties of the body as of the sensitive Soul: And so, that hath distinguished a great Apoplexie from a little one, that the lesse hath besieged the inflowing Spirit; but the greater, the implanted Spirit.

Likewise there are in Simples, those faculties which make drunk, do bring sleep, drowsiness, forgetfulness, blockishness, foolish madness, furies, raging madness, or doatages; because they contain them in themselves: For in the Apple there was the knowledge of good and evil. And there are other things which are carried into loves, angers, yea toward certain persons onely; So that the Monarchy of the life and body being firm, they trouble only the functions of the Soul. And furthermore, there are some which also keep degrees; as they who lately complained of adverse, troublesome, tedious and involuntary sorrows, do at length also obey madnesses: And therefore there are some which do add faint-heartednesses, and the terrors of certain objects onely. Others also do remember all things acted at the time of their fury, and the judgement of the minde is seen onely to be sorely shaken. That all these things I say, do strike at the Head, but that they do not arise from the head, the one only hypochondriack passion teacheth: For it presageth a storm, and fit, if a vein do bear strongly, and with an unwonted tempest: But the action of government hath hitherto stood neglected, & the very soulified or quickned faculty of the Duumvirate hath wandred about as a stranger, and they have vainly bestirred themselves onely about the lying purgings of black choler: that is, about the meltings or weakenings of the strength. (In the mean time, the Quartan Ague hath alwayes laughed at, and cut off the hope of the Schools, and the boastings of these): therefore all the command of madnesses, and of struggling Diseases, is attributed to black cholerick vapours.

Therefore it is clear as the light at noon-day, that nothing hath been known in madnesses, nothing enacted in the Apoplexie, nothing thought of in the stranglings of the womb, and lastly in the on-sets of the falling-Evil, with fruit or profit, besides the vain torturings of the Body, dissolving Butcheries, and vain losses of the strength.

For it hath oft been tried, by things greatly sleepifying, to succour madness, and in vain: For they scarce procure sleep in their four-fold quantity; and therefore the administering of the same is full of terror: But fury is not diminished by drowsie sleeps, or bonds: For stupefactive Medicines, do afford sleep, and troublesome Dreams: For madness is nothing but a watching or waking dream: And therefore Opiates do bring on hurtful sleep, and that with labour.

For whosoever he be, that cannot resolve the occasional cause of a Quartan Ague from the Spleen; much lesse can he convert himself unto the curing of madness: for madness sits for the most part without a material error, in the hypochondriack part, and for that cause it is derivable on posterity.

Indeed madness differs from doatage, in this: that that wants filths. Those who refuse to learn, will laugh, because I affirm, that one, or a few secrets of *Paracelsus* doth prevail over every Disease: whom at sometime in its own place, I shall satisfy: but now it is sufficient to have repeated, that there is one Soul in the stomach, in man; as it were in its own bed, from whence the vital powers are universally to be drawn: and whatsoever troubles or provokes this Soul, that very thing is constrained to depart by the unity of a Remedy, if it containeth in it the strength and essence of all the members.

Which thing, that it may be made so much the more manifest, I will bring a History. First, I have seen a fat Body, whose whole fatness hath been resolved into Liquor, which afterwards was voyded by Urine: For I could not think, that the Reins had their office of transchanging fat that was extended under the Skin, into water; but I rather believed, that that office was to be granted to that faculty which formed the venal blood into fat: To wit, that it belongs to the same faculty being hurt, to convert the fat into Liquor, whose office it was before to

compose fat out of venal blood: But the Kidneys have not that Dignity to make us fat, or lean; while as many do oft-times wax fat with consumed and stony Kidneys: But from thence, the chiefdom of the stomach doth manifestly appear; and that as the Root doth govern the whole Tree, and the Comedy of the digestions hereof, as well in the Leaves, Fruits, and Barks, as in the Wood, Pith; and Branches; so also, the same thing doth likewise happen in us by virtue of the Duumvirate: For it often times comes to passe, that a Capuchin being burdened with long fasting, and being satisfied with a little Drink, and a little Ale, is endowed notwithstanding with a grosse habit of Body: But on the contrary, great eaters, and those who are brought up with dainy huckstery, are seen to be notably lean. Surely howsoever I do meditate of both these chances, I finde the fountainous digestion of the stomach to be the governers of the other, as it were successive subordinate ones unto it self.

60 But at least, it is a wonder, after what sort, the Oily fat being resolved, doth return back into its former Liquor, yea is drawn back into the veins, and at length into the Reins through the Trunk: which thing surely is wholly dark in it self, unless there be a full power, authority, and faculty of the one life, from its seat, over the whole Body: whereby *Hipocrates* hath distated, that the whole Body is wholly an un-respiring, and expiring thing: in contemplation whereof, I have elsewhere said, that man is not called an Animal or living Creature, but by an injurious name: For he is, he which put proper names upon all living Creatures; but not on his own self; because his own knowledge of himself did fail him, because it is that which was not found, nor was within the latitude of living Creatures: he presently beheld (although some one Character did not answer, which might represent himself to himself) that there was something present in humane Nature, which did climbe above the condition of soulified Creatures.

61 And that thing, with *Adam*, the Schools might have sufficiently sifted out, if they had at least once considered, why man onely laughs. Truly laughter is not from an admiring of things present, or past: For an Infant doth often times salute by his own laughter, those that talk unto him. Therefore laughter is made from the knitting or joyning of a double soul, which Beasts want: For the sensitive Soul (being the Fountain and original of the first conceptions) considering of something that is pleasing to it self, doth together with bruit beasts, conceive that thing in joy: but while the minde in a piercing light, perceiveth it self to be the companion of the sensitive Soul, it being as it were full of admiration, doth condescend in the pleasant conceits of the sensitive Soul, as it were admiring that there is something which is worthy of joy; and from thence proceeds laughter: Because the minde doth the same thing in laughter, which the sensitive Soul onely doth after another manner, act in its Body by the tickling of an itch-Gum: For any one doth sometimes leap or hop a little, if he shall but onely see a threatening tickler. Indeed the Soul understands, and hath known a thing in its own Sear, all whereof, it very often, cannot finde in the head, although it hath sometimes known, pronounced that thing distinctly, & re-plowed it into the sheath of the memory: For the Duumvirate consisteth of an understanding of its own, of the immortal mind, & moreover, of the understanding or imaginative faculty of the sensitive Soul, using its own Organs diversly distributed, the Colledge whereof notwithstanding is celebrated within the seat of the Soul. I have already expounded, after what manner the Duumvirate doth exercise its own Authorities or privileges on the bowels, on the heart, on the head, Sinews, in the giddiness of the head, yea and on the principal faculties of the minde: it remains onely to explain, how much force it may have on the Lungs: wherein, in the first place it is obvious to our sight: That he who by reason of a too much sitting life, hath been easily intercepted at every motion of breathing, I have freed the same persons often times, and that by one onely vomitory potion: So from thence I have remained confirmed, that the whole difficulty thereof is seated at the bordering places of the stomach, and the Lungs to be accounted guiltless. But as in regard of Coughs, surely it is manifest that some Opiates do freely operate, and command, not onely that such people may sleep the better, and longer, or quieter: but I remember, that the *Laudanum* of *Paracelsus* being taken, although it did afford well-nigh waking nights unto one that had the Cough; yet it so appeased the Cough, and restrained plentiful, yellow, and compacted Spittles, that they were not onely presently diminished in quantity; but also that they were changed into snivelly, somewhat pale, and afterwards into white spittles: Especially also, because the Opiate being taken late, returning by vomit in the morning, did resist the Cough to be suspended or withheld, and also the generating of spittings by reaching, being horrid in plenty, and colour, to have stopped.

63 First of all, I think that I have abundantly demonstrated elsewhere, under the toy or dotage of a Cararrhe, that spittings or reachings: are not defluxes from the Head into the Winde-

Winde-pipe. Therefore it is manifest enough, that they are uncessantly digested in the very Conduit of the rough Artery: And by consequence, that a Medicine being as yet in the stomach, thorowly mixed with other supper meats; doth restrain, that the nourishable Liquor of the Winde-pipe become not degenerate, and depart not so plentifully into that muck or filth: wherein, the restoring or fortifying force imprinted on the stomach, is evident, that it is already conveyed unto the Steward of the Lungs, and that in the same place it stretcheth forth its own Authority: which things indeed, as I in my first years, beheld with joy and admiration, thus to happen; so afterwards I studied to increase that restoring power, by detaining it, the Opiate, stupefactive and hurtful faculty being the while suppressed: For I was presently after, more assured, that the solved flowre of Sulphur doth effect in this case, those things which from the solved Body of Sulphur it self do not a whit happen: And all that indeed, not inasmuch as Sulphur, as such, doth enter unto the Lungs, nor indeed that it should be admitted under the priviledge of flowrs, or should come down after every bound of the digestions, every way constant and unchanged, unto the Instruments of breathing; but onely as the anodyne or allaying virtue in the Sulphur, should thus plainly appear: which being as yet detained within the stomach, should from thence, by the authority of the Duumvirate, contend unto the spiritual government of the Lungs. Happy therefore is the sick party, whose aider the Physitian, hath known how to separate the deadlynesses out of Poppy, its succouring Remedy, the stirrer up of the power in the Duumvirate being retained: Otherwise surely, the hurtful together with the profitable, are taken in at once, and the one hinders the conveyance of the other. Therefore Opiates cannot induce sleep, but at least they can restrain the return of the spermarick and nourishable Liquor into a degenerate and banished one, and into the so frequent and horrid reaching filth and spittle that is to be expelled: The which indeed, by how much the more plentifully it is expunged or spit out, and seems to be dispatched, by so much also the more abundantly it increaseth afresh: wherefore the restraining of a degenerate generation, is evidently enough known not to happen but by a restoring virtue raised up within the Pipes of the Lungs: To wit, the hurtful power of the Opium is blunted or repressed, so as without sleep (at least, not by a sleepyfying virtue) a liberty of breathing is brought in in peace, quiet, and without a Cough, hissing or wheefing, & snortings. But the stomach prevails to restrain the producing of so many phlegms cast back by reaching, as the digestive faculty thereof is chief Ruler over the other digestions: And therefore the aforesaid Opiates of the produced *Mucilages*, do cure; as long as that defect doth issue from the vice of the digestive Ferment; But not when it depends on a corrupting of the innate or inbred strength: For then also against the stomach's will, it hastens into a Consumption; no otherwise than as it is impossible for the stomach, to restore the life already bending or declining into a fall.

CHAP. XL.

The compleating or perfecting of the minde.

1. *The blinde knowledge concerning the minde.* 2. *What the chief operation of the minde may be.* 3. *The thingliness or essence of the sensitive Soul.* 4. *Quick-sightedness is not the Daughter of the minde onely.* 5. *It is proved.* 6. *From the fruits of the Soul, the knowledge thereof is to be fetched.* 7. *A nearer knowledge of the minde.* 8. *The difference of the sensitive Soul of man from that of a brut Beasts.* 9. *A dispensing of the fruits of the sensitive Soul.* 10. *They flow from a fore-existing knowledge of the Senses.* 11. *An exhortation.* 12. *The operations of the minde are more abstracted.* 13. *Things required unto the purity of mental operations.* 15. *The Prayer of silence is commended for the knowledge of the minde.* 16. *A Reason is added.* 17. *The Majesty of the minde is learned from the wisdom of the Father.* 18. *The three wishes are explained.* 19. *Their excellency.* 20. *Whatsoever the Lords Prayer includeth, is new and unheard of.* 21. *The top of an amorous wish or loving desire.* 22. *The place of a sensible fewel.* 23. *The abstracted secrets of the minde are felt, and there is not a word meet to expresse them.* 24. *An illustrating of the amorous minde.* 25. *The Author willingly confesseth his own nothingness.* 26. *The late directors of the minde, who have entred in by the Windows, are hissed out.* 27. *These shall fall in the fulness of time.*

I Have already spoken some things concerning the Birth and offices of the sensitive Soul: but there hath not been as yet said enough, and much lesse concerning the immortal mind; because that, in which two words, whatsoever things we have by faith concerning the minde of man, are almost explained or declared; and there is nothing at all, which can bring us into a manifest knowing thereof: wherefore, whatsoever we search into concerning it, is hitherto involved in darkness, and plainly unknown: For neither can we devise any thing touching the thingliness or essence of the minde, besides what we have learned by operating, and what we know to be freely given unto us: For we are commanded to know and distinguish a man by his works.

But neither is that the chiefest operation of the minde, which after a drawn knowledge of the premises, the judgement of man doth form and conceive to it self from the conclusion: because neither hath the judgement of man it self, such a proper respect to the minde, that it is the immediate off-spring hereof: For the minde adhereth to the sensitive Soul by so strict a bond in us, that the commerces of humane custom can scarce hitherto separate the distinct offices of the same from each other. Truly all abstracted speculation is even hitherto believed to be the Workmanship of the minde alone, to wit, under which, labours are felt in the head: Especially because these very things are believed to be strangers to brut beasts: But I have already elsewhere demonstrated, that Bees do observe their numbers, and every morning distinguish their own Hive from their neighbouring ones, by their numbers; and likewise that therefore also they re-number them in returning, lest they should lay up their own fardle of Honey and Wax for an unknown and unacceptable Common-wealth. But nothing is so strange in bruits, as the exercise of numbring. So also we observe in Beasts a certain phantasie, and no obscure marks of discourses: as also a judicious choyce selectively of one before another; And that indeed even in accidental unaccustomed things, nor those ever before seen, and much lesse in things diligently taught them by their begetter: For the Serpent was more crafty than the other living Creatures. Wherefore if among bruits

brutes there are differences of quick-sightedness noted, there is place left of conjecturing, that in man, the same operations, are as yet, far more diligent, powerful, eminent, and frequent, than in brutes; and that the sensitive soul of men doth far exceed animal creatures in quick-sightedness; unless the sensitive soul should be a stranger to men, and altogether a foreigner to their nature: Because he is he, who was wholly beloved, and raised up into the Image or likeness of God, but not that he should degenerate into a specifical and brutish soul, and so defile or mar the Image of God. Therefore the sensitive soul hath remained a voyd rable in man; because it is that which took its original from the fall and spot of corrupted nature, and so also it hath scarce obtained so proper a dignity of imagination, which may not every way depend on the operations of the mind, as shall straightway be more clearly manifested.

And although quick-sightedness or sharpness of wit, be the daughter of judgment, and discourse, yet it is not therefore moreover a proper operation and fruit of the mind: For that which now even from the first fall, hath resigned up all the offices of life unto the sensitive soul, hath also by a just desert, so contracted the judgment of its own quick-sightedness to the Phantase of the sensitive soul, that the faculties which are exercised in the Inn of the Brain, and do constitute a difference of men in the sharpness, speediness, and dulness of judgment, are not by an unjust title believed to be delegated to the sensitive soul, and as it were proper to this, because its inmates: wherefore, whatsoever faculties in us do distinguish the Climates of the earth, vary them, and cause diversities of wits from thence; surely it is not likely to be true, that the same do issue from the homogeneal simplicity of the immortal mind.

And I at first long stuck in these things, until I had seen madneses, dotages and foolishnesses to be introduced by Simples, as well those external or foreign, as by those which sprang up in our own cottages: Because they were those which I knew, have not access unto the mind, the which indeed, they do not so much as touch at, and much lesse are able to pierce it, and least of all do they attempt to overcome the same. Certainly, many rough places have been met withall in this journey, and no aids of distinctions: which sluggishness, to wit, of Predecessors, driveth us from the knowledge of our mind, yea and withholds us from the true knowing of its operations, without which indeed it is impossible to judge of the calling, ordination, and direction of the mind in every one of us: And so that negligence hath made us hitherto like unto beasts, and keepeth in us, thick, beast-like darkness, if the Almighty goodness had not enlightened it by faith.

Wherefore neither could I more distinctly set before my eyes, the operations proper to the mind, than by the Prayer of silence; because it is that which is most properly a natural operation of the mind, plainly abstracted, and is believed so to be; to wit, in the splendour whereof, a diversitie of the operation of the mind doth clearly appear, from the judgment, discourse of the sensitive soul, and decrees of the Phantase: And this maketh us the sons of darkness more judicious and quick-sighted, like the Serpent, and doth far prefer us before the sons of light in this respect: For the sensitive soul liveth in us, and utters no sluggish testimonies of its own life; yet because it wants a brutish and specifical supposingness, therefore it rejoiceth only in an undistinct life of light, and conceiveth the vital operations of the mind in it self, and appropriateth them unto its own exercises of powers; yet they are not the true and proper functions of the mind: because even as the mind is now since the fall involved in the light of a frail or mortal soul, and therefore doth as it were plainly cease from all government of the body, and beams forth its own vital light into the sensitive soul its Vicars: yet the actions thereof are not therefore those of the mind in it self, which therefore utters only abstracted functions, and those co-like to it self in this thing. Concerning the searching or hunting out of Sciences, I have contemplated about the operations of the mind, and especially those which might concern the dignities of the understanding: But those things are not sufficient for any kind of knowledge of the mind: wherefore that we may draw out some kind of knowledge thereof by its own abstracted operations, I will repeat what things I have already above written concerning the Image of God in us; to wit, that understanding, will, and love, desire I say, or wishing, are powers so intimate to the mind, that they do denote the substance of the same: That love I say, proceeding substantially from the other two: and from hence I perceive that every and the whole function of the mind is immediately begun in us. But besides I have also demonstrated elsewhere, that our life is now another, and corrupted, after that through the flesh of sin, the sensitive soul which is earthly, mortal, frail, animal or sensual, and devilish, was stirred up, whereto the immortal mind was fast tied after sin.

Yet we must remember, according to the doctrine delivered concerning the original of forms, that the sensitive soul in brut beasts, is not a formal substance, but a substantial vital forme,

46 and the which departs into nothing, no otherwise than as the light of a candle : that it is indeed a vital light, created by the Father of lights, and a neither creature, between a substance and an accident: which indeed in bruits subsisteth in it self absolutely, and is limited into a bruite species or particular kind : But in man, because it came to him afterwards, nature being now corrupted, it is not of a limited bruite species, but only a vital light, and not the life it self, even as in bruits ; because life is beamingly inspired into, and as it were borrowed for it from the mind, which it covers or wraps up ; no otherwise then as the Moon receives her light from the Sun. And although this sensitive soul of man, doth far exceed the souls of bruite beasts in quick-sightedness, yet it acts nothing without the mind : for from that which it deriveth life, it cannot but borrow also a power of thinking from thence, to which it is so intimately tied, that the mind wholly pierceth the sensitive soul. Indeed the sensitive soul doth think by a power of its own, but it is illustrated by the mind ; and therefore the whole cogitation of our sensitive soul is of the whole man : For verily it so happens, even as in the Moon and the Sun : that indeed hath a light proper to its self, but she shines more by the reflex light of the Sun, (even as elsewhere concerning Meteors) and in the Moon, her own light doth as it were perish. Therefore the sensitive soul in us doth diversly think, and degrees of enlargement are felt in cogitation.

9 For first of all, in madness, foolish madness, foolishness, doatage, fury, drunkenness, and dreams, there are indeed divers cogitations of the whole man ; yet with so smal a light of the mind, that this doth bring no brightness unto it, but that which at least it cannot refuse, by reason of the strict necessity of its bond. Therefore the sensitive soul it self, because it is mortal, being invaded by the injuries of frail things, yieldeth to their importunities, doth well-nigh only think by a little light of the mind, as being helped by a prop of life : wherefore those thoughts are voyd of sin ; Because the mind doth not think in those, but is over-clouded by a contracted contagion of the sensitive soul. Furthermore, how much the cogitations or thoughts do the more go back from that guiltless contagion, unto abstracted discourses ; so much the more do they partake of the life of the mind, than of the proper liveliness of the sensitive soul.

10 Indeed every sensitive thought is brought on of necessity, by the service of the senses, neither doth it exceed that necessity, however clearly it may abstract it self from those : For whatsoever may be perceived by the senses, that doth not as yet reach to the bottom or soil of the mind alone. Therefore this variety of thinking in the sensitive soul, doth bring forth so great a latitude and varieties of our judgments. In the next place, even as in the Moon, the light of the Sun doth manifestly lose its own heat, and puts on it self a strange or foreign cold ; so also in the vital sensitive soul, the beam of the mind, although it be nakedly intellectual, doth pass over into the dominion of the sensitive soul ; and so that also it there finds an earthly law, opposite to the law of the mind.

11 Wherefore we must diligently procure, that as much as is possible, we do withdraw our selves from all that which may be conceived by the senses : for so we come unto the Mountain of the Lord, whither the scope of our journey is. But neither to have thus spoken this by the way, doth sufficiently teach the naked operations of the mind, neither is there a way seen, whereby we may attain any kind of knowledge of the mind.

12 For those kind of thoughts are as yet of the whole man, as long as there is any selfishness, or the mind doth apprehend something without it self, with a duality or twoness, and doth not yet behold it self as a transfigured thing. Indeed it beholdeth the properties of man, or of other things ; so the whole thing it self : but it is not the naked intellectual light of the mind which then operateth, but it is a combination of both vital lights, mutually piercing each other. In which act, alas, as the immortal mind doth easily, so also through an evil accustomedness, it doth for the most part willingly obey the frail sensitive soul its Chambermaid : Even so that, that we may come unto the wished for purity of our mind, thinking purely and nakedly in the abstract, the doctrine of S. Dionysius to Timothy, is first to be received :

13 For that divine things may be understood (but divine things are whatsoever things the naked Image of God beholds) and as yet after a slender manner, and for the looking into divine Secrets, the Senses, are to be rejected, and whatsoever may be perceived by the Senses. Moreover, reason, the actions of reason, and whatsoever may be known and perceived by reason, whether that be created or uncreated ; and that thou goest out of thy self, and out of all knowledge of all those things, and that thou comest into the one Unity of Him, who is above all nature and knowledge. Thus he.

For the mind is the neereft image of the Divinity, therefore as the eye beholds nothing more

more absolutely than the Sun it self (the cleernesse of whose light notwithstanding it bears not) but all other things by reason of it: So the mind doth principally and intimately think or contemplate of nothing properly, besides that Unity, and all other things for the same Unities sake.

Whence it manifestly appears, that as long as any thing is thought of, which may be perceived by the senses, or reason, it is not yet a pure and naked cogitation of a mind abstracted or withdrawn. But the manner of coming thitherto, is indeed read, being above described, but it is moreover far remote, and almost unpassable, by reason of the every way withdrawing and banishing of all created things, yea and every consideration of that which is uncreated; that is, a renouncing proceeding by a sequestration, even unto every activity of the mind; which indeed doth therefore exclude every thought and contemplation of the mind, and doth expect or wait for from above the in-flowing light freely given, by doing nothing; but only by suffering, after all selfishnesse is exhausted. But seeing it doth not at all consist in our own power to be wholly freed, and so that it rather puts us in mind of the grace of ravishment, or violent prevalency, than of the true, and naked, and pure operations of the mind, which I intend to take a View of in this Chapter, for a compleating of the Treatise of the Soul:

Therefore, according to my poverty of judgment, a man doth not in acting climbe neerer unto a super-eminent uncloathing of his mind alone, and an abstracted baring of the light of understanding, than by the prayer of silence in the Spirit, wherein the delights of God are to be adored: Because he then doth issuingly illustrate or make light, clear, or famous, that mind, as the unclothed image of himself, being thus reflexed in the glass of his own Divinity. This indeed is that which the most glorious Goodnesse wisheth for. But that fruits or exercises may bewray the essence or thinglikenesse of the mind; I have thought that, that is not more powerfully, nor elsewhere to be had, than from spiritual exercises, whereby the mind it self rids it self from the co-knit concepts of created things, and from the service of the acquainted Senses: For it is manifest what the mind it self may be, while it hath withdrawn it self from concepts, which are wont, or might stain it, or at leastwise hinder it from coming unto the nakednesse and purity of it self, wherein it may be able to worship the aforesaid Unity or onenesse.

The Lord Jesus therefore is the Way, the Truth, and the Life: the way I say, unto himself, the Truth, and unto the life of the Father of Lights. Therefore the way is directed unto the obtainment of abstracted truth, whose wished desire it is, that the hidden truth which he hath decyphered in the mind, his own image, may be certainly known by us, and worshipped in the Spirit. Where Himself is, the Kingdome of God is present, with all his free gifts: and therefore the manner and mean of worshipping in spirit, cannot be more nearly known, or perfectly learned, than by the way and truth it self, and so by the prayer which he hath dictated unto us: wherein are first three amorous or loving wishes or desires of love, and as many Petitions.

For those wishes are without all selfishnesse, and are naked respects toward God himself, and therefore the most pure of all those which can be wished for, and thought by love. And the first of them is, that which the Truth speaketh, *Seek ye first the Kingdom of God, and the righteousness thereof, and other things shall be added unto you*: But it is not the righteousness of God, that righteousness may be done by us (for no one living shall be justified in his sight) but that his Name may be sanctified, which is not only due unto him, & so a just thing: but that loving wish justifies us. For it presupposeth first of all, Christian faith it self, and then also his infinite goodness, whereby he vouchsafeth to be our Father: And indeed, in the word *Our* [selfishness is put for the goodness of God, & the obliging of all of us, which otherwise is nowhere seen in the three wishes. And thirdly, it sheweth forth his vast majesty to be co-measured by his dwelling place of the Heavens, which is the work of his own hands: And so, such like things as those being premised, an amorous wish or desire is kindled in us, which doth not desire, that his Name be only sanctified by his only begotten Son, and our Mediatour, where Deep calls unto Deep: neither also, onely that the heavenly Wights, and whole Church militant, may adore his unutterable Name: neither also therefore is it the sense, that his Name may be sanctified on earth, like as it is in heaven; but that it may be sanctified or hallowed in us, and by us; in all this, notwithstanding, selfishnesse and nothingnesse being renounced: and that there may be a naked and most pure reflexion of the honour and delights of God in that which is to be with us, and to be worshipped in the Spirit of love: And therefore also the other succeeding wish doth not ask the Kingdom of God for it self, but the Kingdom of God which is in us, that it may come neerer to us: Not indeed nakedly, and simply for our

sakes, but because it is of his goodnesse to be with the sons of men in delights : Wherefore also it is wished, that his own Will may be done, in us, upon us, and by us, with a full resignation of our own will. Therefore the three wilhes do proceed from the soul, without a modal restriction or reflexion on us ; because they do exceed all perionality of the creature, that God may be worshipped for himself,

19 And therefore they do excell all force of prayer, petition, praising, giving of thanks, yea and of glorification it self. For to give thanks, doth denote a benefit, and implyeth a receiver : but glorification, praising, or sanctification it self, as it brings down my selfishnesse before the sight of God (although in the mean time it be due and obligatory) it far goes back from the excellency of a most pure and amorous wish or desire, wherein the sanctifying of the Name of God in us, is desired, in which deep calleth unto deep. For who am I, who may presume in respect of an infinite, to sanctifie that Name ? who indeed am nothing but a worm, and a most miserable sinner ? And therefore the amorous or loving desire of sanctification, doth as much excell, let thy name be hallowed or sanctified by me, as a wretched sinner differs from the Son of the God-bearing Virgin.

20 For praises, and prayers, as well in the Mosaical Law, as at this day, were made by Hymns, Psalmes, and Prayers. But man, before the truth be perfectly learned, hath never attained the vigour, height, and depth of a loving desire, of sanctifying the incomprehensible Divinity in us, wherein there is more excellency than all creatures together are able to comprehend. For that sanctification is wished for, not because God is most excellent, most great, bountiful, &c. For those things include a selfishnesse of the praiser, not to be suffered together with the divine Name.

21 Therefore the desire and wish of an amorous soul, fervently desiring the sanctifying of the Name of God, nakedly and simply, is not made indeed by a creature below God, but by a melting of the mind, desiring in the love of God : for the least thing which it contains in it, is to offer it self to God with a resignation of its whole, and likewise to will, act, and suffer any thing, with a total amorous offering up of the heart, soul, and strength into the obedience of the Divine Will. In which loving or lovely offering, all thoughts besides the naked desire of love are unsufferably excluded ; because it transcends all reflexion : For because it is naked, it despiseth every garment which reason might administer unto it.

22 For that so naked, and excellent love ariseth in the seat of the mind, and is felt there where every first conception is made, without a likenesse and imagination. But as long as it can be expressed by words, it is not yet a naked, abstracted cogitation of the mind, which indeed by *B. Dionysius*, is described to be above all that which can be conceived by reason, sense, and words : Truly it is felt, but without discourse and imagination.

23 Because by a naked conceiving of amorous truth, truth it self is then stricken with, enjoys, and approacheth, yea, and presently pierceth by an unexpressible touch of the mind : Otherwise, as oft as Ideas are formed, or conceptions expressible by words, they retain a motherly frailty of the sensitive soul, a brickeenesse of unconstancy, an uncertainty, and disturbances subject to passions.

24 In the power therefore of understanding, and indeed in the native vigour of the mind, and the desire of a loving soul, a certain God-like Being is bred in us, as it were in the Young of a longing woman great with child, or the mind it self is purified, and so it redifies the mind, and the Image of God it self : For that is not by sight, and a sensual appetite, as in a woman with child ; neither is it conceived in bodily dens, as neither is it marked in a strange Young : but it requireth every faculty of the mind, soul, heart, and strength, and therefore the Ideal Being being brought forth by an amorous wishing or desire, remaineth in the mind it self, which it so disposeth, that it may transchange it into a God-like Image, by grace flowing to it from God. But who am I, who do write these things ?

25 Truly, I fear least I may be a Bell, calling the Faithful together unto the Temple, which it self remains in the top of the Tower abroad : But onely I hope, if I shall profit in the aforesaid wishes, that I shall find my self, whereby I shall by humbling my self, neglect my self the more.

26 Moreover, there have lately arisen directers of the conscience, transferring on themselves all liberty of the mind, to be dispensed especially on the devoted Sex : this Sex they called within unto themselves, saying, that not only Christ the anointed, but also that Jesus the Saviour was with them : But these do presently erre in their first entrance : for they call their devoted women together unto contemplative exercises, to be performed by companies or troops, which the truth it self commendeth to be done after another manner, the Chamber-

door being shut after them : And then, they require honour, reverence, and riches to be due unto themselves, under obedience, and a manifold vow. And so the hurtful or envious man scatters his own seeds for tares, that he may suppress those also which were good Seeds.

And therefore the Prophet *Hildegard* hath foretold, that at length secret luxury shall be co-mingled with them, and they shall fall even as *Simon Magus*, by the prayer of the Apostles, or of the Bishops and Faithful. But besides, when any one hath at least once been brought into the vigour of that wish or desire, himself being pricked by his own spurs, will hasten to return thither ; and being now as it were made expert in the wayes, the passage will be easier for him afterwards. In the mean time, because every one doth not reach thitherto, God hath made divers mansions to be occupied in his own Palace : So also he hath ordained divers means to this end, through Charity, which I willingly omit, because they are not the proper objects of our Medicinal Faculty. Therefore it is sufficient for me to have proposed the largeness of the mind in acting, and its wandering power of forming Idea's or shapely likenesses, as well for the consideration of diseases, and of a sound life, as for the exercises of virtues.

CHAP.

CHAP. XLI.

The Scab and Ulcers of the Schools.

1. Why the Author treats concerning the Scab and Leprousie in this place.
2. He repeats more clearly the beginnings of his repentance.
3. An error in the causes, indication or betokening sign, and remedy.
4. A question proposed to Physicians and the Schools.
5. The credulities in the Author.
6. Late Consideration.
7. Out of my History, fourteen Conclusions.
8. That the speculations of the Schools are scabbed.
9. A Scab remained in me before the distemperature of the Liver.
10. Puslules or Wheals in Scabbednesse, are signs, and fruits of the Scab, but not the Scab.
11. Grasse roots in an Apozem are taken notice of.
12. The occasional causes of Ulcers.
13. The Dreams of the Schools.
14. Galen is noted to be ulcerous.
15. The unconsiderance of the Schools, and Galen.
16. Some absurdities.
17. Thin Sanies, and corrupt Pus are not excrements, although filths.
18. The corrupter in an Ulcer is the Ulcer.
19. Venal blond is not vitiated in the hollownesse of an Ulcer.
20. The vain labour of the Schools.
21. The root of Vlcers.
22. The hollow of an Vlcer is not the Vlcer it self.
23. Considerations of Pus or corrupt snotty matter.
24. The differences of Pus and Sanies.
25. Galenical ignorances.
26. Some absurdities of the received opinion of Galen.
27. The occasional cause in the corrupter.
28. How ridiculous a Catarrh is for old Vlcers, and how foolishly Canteries are applied thither.
29. The ignorance of ferments, what it brings forth.
30. How there are so many diversities of Vlcers in one onely venal blood.
31. Corrosives, if they can heal Vlcers, the rather notwithstanding, their corrosion being appeased.
32. The trifles of Paracelsus concerning the Microcosmical birth of wounds.
33. Paracelsus is urged with an actual and true Identity of the Microcosm or little world.
34. An Idiotism of the same man, concerning the nourishing of wounds from without.
35. A healing Secret of Vlcers.
36. The curing of wounds.

Hitherto I have shewn, that the causes of Diseases delivered by Galen, and his followers, are erroneous, and false: it should be meet even now, to passe over unto the true doctrine of Diseases, although even hitherto unknown, unless some things did detain me, and elsewhere divert me, which of right seem to be premised: For after that in a Book set forth, I treated concerning the Plague the Queen of Diseases; and also that I had spoken in Print, concerning the affect of the Stone, as it were a Monster bred as well in us, as in Urinals or Chamber-pots without us; and I had by the way there occasionally treated concerning the Leprosie, Apoplexy, Palsie, Sleepy evil, Cramp, and of Diseases a kin to them, but nothing at all touching defects of the skin; I thought it worth my pains, before I do professedly finish this my labour of the essence of Diseases, as well in the general, as in the particular kind, to premise some particular things which I have thought will open the doors unto the entrance of the knowledge of Diseases. And first of all, I will touch at the diseases of the Skin, as those that are the more obvious or easie to be seen.

Wherefore in the Book of Fevers I have rehearsed indeed the principles of my repentance, whereby I was compelled to depart from the method and doctrine of the Schools, that I may shew the foolishnesse of the Maxims whereby the world is deceived, as well by the drinking of purgative things, as by an estimation that diseases are made, and freed by the ejection

ejection of liquors which the Schools do perswade to be the constitutive ones of us, and those erring in their due quantity, and quality. Therefore it hath not irked me, hitherto to refer, and to repeat the same beginnings of my repentance. I being a young man, and about to take my leave of a certain Gentlewoman, held her glove and hand for some little while, which laboured with an hidden and dry Scab: But I thereupon, presently contracted, not indeed a dry, but a thin watery Scab, to wit, onely; and that by a sober touching. And then I observed many times, that hand-towels have brought forth the manginesses of scabbed persons, and the hairs of moathy cloths, moaths; as also the contagions of leprous, and lecherous diseases, to have been propagated by a participated ferment: and that thing the Proverb related to incorrigible persons, signifies; to wit, that one onely little bird infects a whole flock with his scabbiness.

For such kind of vices being transplanted by a poisonous fuel, are notwithstanding reckoned by the Schools, without distinction, in the guilt of the Liver, and to be stirred from an unseasonable or disordered heat of the same: As if the contagion of the Skin of one Sheep doth distemper the Livers of the other Sheep. Truly this one onely Consideration was unto me the first beginning of light Adeptical: From whence indeed the Maxims of the Schools were with me manifested to be a Scab, and they forced me to another matter, after that I saw the remedies of the Schools to be vain, and the Maxims of the same to be frivolous. Truly I called to me two of the more famous Physicians of our City, almost rejoicing that I might now understand in my self, whether their Studies might answer to their practise: But the Physicians having seen the matter Scab, presently judged, that adust or burnt choler did abound in me, together with salt phlegm; and so that the faculty of making blood in the liver, was distempered. I rejoiced presently, because those things which Authors had sung unto me, were confirmed by most expert Masters: Because I who had learned, that in Science Mathematical all Speculations were most exceeding true, did believe that thing to be likewise common and unseparable to the rules or maxims of healing: I thinking that they were that which they ought, and did promise to be. And presently, according to my ancient credulity, I asked what that distemper of the Liver should be, which at one and the same act, should enflame yellow choler more unjustly than was meet, and also engender more phlegm than was meet; seeing an act of the same root, or of the same sanguification, could not be at the same time, and in the same bowel, a two-forked, or double generation, and so unlike, to wit, that which should abundantly send forth a fiery choler, and also a cold and watery phlegm. The most expert Masters doubted, and being amazed with their eye-brows bent, they long beheld themselves, and at length the *Junior* of them answered, that the same distemper of an inflamed Liver, did not therefore afford true phlegm, but an abounding salt phlegm, but that the temperature of salt was hot and dry. To whom I replied, Should therefore the Salt of the Urin be made through the vice of the Liver and heat abounding? but the breaths of fleshies that are not salt, nor put on salt, although they should boil with heat? The *Senior* answered, These things were to be proposed by me in the Schools, but not in times of practise, wherein the faculty had appointed hours for gain. But he presently asked me, what Authors I had consulted with? or what I had learned was to be done? I said, for the cooling refreshment of the Liver, and blood, the vein of the right arm under the Cephalical or head-vein was to be cut: and then that we must proceed by cooling Apozems, in regard of burnt choler, yet so, as that cutting and extenuating, temperate things were to be mingled, by reason of the saltness of the phlegm. I shewed out of *Rondoleius*, an Apozem or decoction, which might perhaps contain 50 ingredients, tending to a most plentiful hope of accomplishing both ends: And seeing they knew not in their readings, a daily diligent noter of all things, they would that I my self should describe all things for my self. Therefore after a sufficiently plentiful letting forth of blood made in the Spring-time of my youth, and otherwise in the fulness of health, I took for three dayes together the aforesaid Apozem, whereinto on the fourth and fifth morning, I put a sufficient quantity of Rhubarb, and Agarick, to wit, that Nature might begin to obey the calling purgative medicine, and that both the peccant humors might be rendred pliable unto it: They praised all things, and especially because I was greedy of learning, and obeying. But on the fifth day in the evening, I took pills of Fumitory, because *Cordus*, (who was afterwards unto me *Codrus*) writeth, that they do draw together, or are profitable in both the peccant humors (for I had not then as yet known by a feigned name, to impose pills on the sick: as though they provoked Stools by reason of the Fumitory, and not by reason of the cruelty of poisonous Solutives.) Therefore on the sixth day, I had at least fifteen Stools: in the mean time, they praised my providence, whereby I had made or prepared my body so fluid:

fluid. Presently after two dayes from thence, because the Scab had not laid aside any of its cruelty, I took the same medicine, with a notable loathing of my stomach, and the like Stools succeeded: They said, that the flourishing age of eighteen years was apt for the breeding of choler: And when they saw, that for all that, the itching, and wheals were nothing diminished, they decreed, that two dayes after, I should take the purging medicine the third time. But then, a little before evening, my veins were now exhausted, my cheeks had fallen, my voice was hoarse, the whole habit of my body going to ruine, had waxed lean; also it was difficult for me to descend from my chamber, and to go, because my knees did scarce support me. These things had befallen me, who was in health, from the touching of a scabbed hand. Indeed at the first turns, I rejoyced when I observed to large filth, and such stinking ones:

6 But I considered too late, that before the purging medicines, I was well in health in my bowels; but now that through a dejected appetite and digestion, I had contracted much leanness, but that the scabbednesse remained safe or firm, with a sharp and hoarse voice. Lastly, that I might see how much choler, and how much phlegm I cast forth, I had made water in an Urinal: and I certainly found, that by a thrice taking of the solutive medicine, I had cast forth almost two little Buckets of stinking and cadaverous choler, the ejections being besprinkled with snivelly branches, which the Physicians affirmed to be that salt phlegm. And in the mean time, while I nourished almost throughout my whole body, mattery and large wheals, especially in my legs; I asked them, whether the corrupt snotty matter of Pus did not denote the venal blood to be guilty, no lesse than choler, and phlegm: They said, seeing that my strength did now fail, they should be silent, as to a repeated cutting of a vein, otherwise meet to be done in the abundance of corrupt Pus remaining. But I repentingly considered, that before, I was in good health, except the contagion of my skin drawn from elsewhere, and that of nothing, nothing was, or could be made; neither could any corporeal body be placed, but in a body: therefore I leasurely enquired, whence so great a plenty of choler had flown from me? and in what place it had layen hid? For all the veins together could scarce have contained the tenth part of the filth, although they should contain no good blood: I knew moreover, that so great a weight could neither be entertained in the head, nor in the breast, nor in the bottom of the belly, although they had been empty of all bowels.

7 Therefore with earnest repentance, and my own dammage, I collected by Science Mathematical:

First, That the name of purging was a grand deceit.

Secondly, That a particular Selection of bringing forth such a humour, or any other, was likewise false.

Thirdly, Because the birth and existence of humours was also false.

Fourthly, That the cause of scabbednesse in respect of burnt choler, and salt phlegm, was feigned.

Fifthly, That the Liver was guiltlesse in contagions of the Skin.

Sixthly, That my Scab did as yet remain after purgings, although not with an equal fury.

Seventhly, That the fury thereof was not slackened, because that some one or more imagined humours were expelled, and that for this cause the abounding of the same humours had offended: For truly, the venal blood being straightway recovered, the scab persisted the same; and so the Scab had been a little diminished through a defect of fulnesse. At length perhaps, after three moneths, I recovered from my scabbednesse by an easie anointing or unguent of Sulphur.

Eighthly, That the Scab is an affect of the Skin onely.

Ninthly, That the Schools did name as well choler, as phlegm, humors ill affected, as well in the veins, as out of them, as well those hurtful, as harmlesse.

Tenthly, That any purging things did promiscuously melt, resolve, and putrifie the venal blood and flesh, even while they abode in the stomach and bowels.

Eleventhly, That it is false, that the venal blood doth return into humours, from whence it was bred.

Twelfthly, That in this thing an impossible return from a privation to an habit should happen.

Thirteenthly, That it is a grand deceit, that those three humours do remain in the venal blood, flesh, and solid parts, that by purging medicines they should be renewed into that, which they were before the framing of the flesh, &c.

All which things, when I found them fighting with the truth of nature, and with the agreement of Philosophy, I manifestly knew the speculations of the Schools to be scabby and false: And so I could not any longer doubt, whether Choler, or Phlegme were the cause of scabbedness: And I thus understood that thing by little and little, with the Grace of God, more certainly than certainty it self, the which alike equally knew by an intellectual certainty, and as it were by a knowledge Oprick, or of the sight, that there is no Choler in nature, nor three humors united with the venal blood: But that which is shewen by the Schools under the mask of both Phlegms, and Cholers, I have demonstrated in a peculiar Book, to be diseasie filth besides nature, and the vicious products of the Functions.

At leastwise in me, the scab was contracted and bred onely by touching, in a full enjoyment of health, before the Liver could even have ever waxed hot: for my scabbedness was conceived in the space of a quarter of an hour. But the scabby Pustules their having more afterwards broken forth in the succession of some dayes, were not so much the scab it self, as the fruits of the same. If therefore scabbedness ariseth from the distemper of the Liver, surely in me, the scab it self was before its own cause.

A Sheep feeding onely of Grass, doth voluntarily get the scab: If that be from a hot distemper of the Liver, truly ye unjustly prescribe Grass for a cooling refreshment of the Liver. Again, the scab in me, the Sheep, and Dog, are cured onely by Oyntments, or by an external aid, neither is the heat of the Liver heeded: Yea Medicines of Sulphur, Bayberries and white Helebores do never prevail against the heat of the Liver. Finally, scabbedness which is suddenly gotten by the touching of a towel, is of the same disposition with a voluntary one: but if that at least, ariseth not from the heat of the Liver: therefore neither doth this, if there are the same causes of the same thing in the particular kinde, object and subject: For at the very time wherein the scab is conceived by touching of the hand, or by the scabbedness of an infected Towel, in the skin of the toucher; the scab is already present; whose Seed or Ferment is in the aforesaid Skin, or Towel; and then the Embryo or imperfect Young thereof is conceived in the skin of the toucher, the product whereof doth at length visibly break forth.

In like manner also, Ulcers are made either from a wound being badly cured, or from a contusion or bruise, as a Cancer in a Woman; or from an Aposteme breaking forth; or at length from poyson bred within, which planteth its malignity in the external part, and doth there fix the properties of its own poysonsome Ferment: from whence also, whatsoever of venal blood is distributed every hour for the nourishing of the part, that is turned into poyson, according to the race of its own Ferment: But humors which may be sent thither from the Liver, do not rise again from the dead, corrupted.

The Schools therefore being credulously misled by Galen, have mutually signed unto his dreamed humors rising again out of the venal blood and flesh, by reason of the importunate distemper of some certain bowel, due to an Elementary fight.

For Galen in his Therapeuticks or curings of Diseases, will have it, that an Ulcer ought to consist naturally of a twofold excrement (for it hath seemed sufficient for him to have laid down this Doctrine, and not to have proved it) to wit, one of a more liquid Liquor or corrupt matter, and the other of a more grosse one, that is, of a corrupt Pus: from hence in the next place he concludeth, that every Ulcer ought to be broken, to require, and be healed by a double Medicine (to wit, through the offence whereof, many being despaired of by the Schools, are dismissed unto old Women, to the contempt of Galen) namely, one which should dry up, and drink up the thin Sanies into it self; in the next place another, which should be a cleanser of the corrupt Pus.

But how seriously hath this man weaved his own Fables? and how undefiled or faultlesse are these toys kept as yet to this day? For now indeed they do no longer remember a four-fold humour, and a four-fold excrement resulting from thence, from the corruption of those. Indeed Galen will have the grosse matter to be venal blood putrified, neither is he mindful of himself, while he teacheth that the blood, in corruption, is turned wholly into Choler. In the next place, if purging Medicines do separate three humours apart out of the venal blood at the will of the Physician, he ought to have remembred, that that happens through the corruption of the blood, to wit, while it departs asunder into its fore-going constitutives (or, whatsoever hath been devised concerning purging things, and humors, is false) wherefore in an Ulcer, that not two onely, but four ought wholly to issue forth: yea according to Galen, an Ulcer without grosse matter (to wit a Cancer, a difficult or malignant Sore, or a corroding one fluid with liquid Sanies onely) shall be more easie to be cured, than otherwise, a grosse matterly Ulcer is: Because it is that which shall have need of driers onely, to wit, Chasse, or burnt bones.

- 16 For how stupid and unsound a thing is it: to have taught, that an Ulcer is to be cured by the cleansing and sequestration of excrements, fruits, or products? But not by a cutting off of the Root, which they nowhere and never knew, besides an intemperate heat? seeing that every excrement shewes a necessary Relation unto the digestion, and part, in respect whereof, it is an excrement: So that a true excrement is a superfluous heap, left by a digestion, and by a part, whereunto it is unprofitable, and therefore sequestred from it.
- 17 Because the name of an excrement, doth contain an expulsion of the impure from the pure: And therefore liquid, and grosse matter, are not the excrements of an Ulcer, or of the part, as neither of a natural digestion; but they are the products of the Seeds or Roots of Ulcers: And therefore he for the most part, and in the most things labours in vain, who cleanseth an Ulcer according to the prescription of *Galen*, especially in the more malignant ones. And likewise it must needs be, that those things which are not nourished, do also want excrements: For nature doth nowhere labour that it may nourish an Ulcer:
- 18 Seeing that in an Ulcer, a proper corrupter doth inhabit, which viciateth the nourishable blood, before it be fit to be digested. A lee also, in speaking properly, is not the superfluity of Wine, but a meer residence; because of Wine there is no nourishing, and no digestion: Therefore an Ulcer, as such, is not nourished, neither doth nature intend to nourish that: Therefore the liquid, and thick corrupt matter, are not the excrements of an Ulcer, but the products of the corrupter; and they are the tokens, signs, products, effects or fruits of venal blood depraved into hurtful matter.
- 19 For the blood which is appointed daily, for the nourishing of all particular parts, is sent, is distributed by distributive Justice: nor otherwise to the part being ulcerous, than if it were moreover, in good health: Whither when it is come down, and cannot be there changed into the true substance of that which is to be nourished, it undergoes the lot which the Ulcerous Ferment commands; and the blood doth therefore degenerate, and is transchanged in the Root of the part wherein the corrupter is placed and resideth; but not in the very hollowness or paunch of the Ulcer: For else, it should of necessity be, that meer and harmless venal blood, should alwayes fall down into the very hollowness of the Ulcer, and by corrupting in the same place, to degenerate: which thing, the Eye and daily experience do affirm to be false.
- 20 Therefore if the Schools do wipe an Ulcer, whether with a Towel, or in the next place, with a cleansing Medicine; although they both do the same thing; yet they take away nothing but the last product, but do never reach unto the radical cause or Original: But if a bloody Clot, or else a bloody Muscilage, do fall down into the Ulcer, that comes to passe, because the encompassing places (to wit, wherein the very Root of Ulcers is) there is so great a storm of torture, that some small vein that is the nigher, being eaten thorow, cannot contain its own blood: And so that the blood, which thus by chance falls down into the hollowness of the Ulcer, is not seen to be changed into corrupt Pus: from whence it manifestly appeares, that the blood doth not degenerate in the hollow of the Ulcer, but in the brims or lips thereof: wherefore also the vanity of *Galen's* Doctrine is seen, which placeth the healing of an Ulcer in the withdrawing of the product.
- 21 The Root therefore of every Ulcer, is in its bottom, and lips or brim; that is, it inhabits in the parts next to the hollowness; wherein indeed is their own Cookroom, in which the venal blood is altered into a corrosive liquid; grosse, corrupt matter, &c. But the liquid matter it self, is the product or positive effect of Ulcers: But the very hollowness thereof, which is commonly reckoned to be the Ulcer of Physicians, is the privative and deficient product: For as a burnt or destroyed Village, is not war; but is the effect accusing the defect, privation, desertion, and destruction made:
- 22 So neither is an Ulcer the wasted hollowness of the flesh; but this is the sign left by the Ulcer: For in the Coasts of the Ulcer there doth an hostile corrupter, and guest, the poisonous Ferment, on every side inhabite, for which cause we see the lips or coasts, and bottom to be diversly altered.
- 23 Let the Schools therefore, take heed what they teach, while they deliver the curing of an Ulcer to consist in the taking away of the latter product: yea corrupt Pus doth not carry the disposition of an excrement, neither doth it proceed as an excrement of nature from the Ulcer; but it is a fruit of the Ulcer, to wit, of a forreign corrupter, fermentally depraved with a malignity: therefore it degenerates, eats up, gnawes and consumes. And indeed, the greater Ulcers do want grosse matter, they weep out continual liquid or thin matter onely, and now and then a tenfold greater quantity, than otherwise a just distribution of blood doth require, and the transchanged Liquor flowes abroad into sharp and devouring waters, which

which the *Galenists* do never dry up with their driers, although they do moreover super-add all their cleansing Medicines, and however the *Catagenians* and *Catatopian* do boastingly glorie of their own experiments.

For corrupt Pus is not procreated but in the flesh being closed, and opened, and those not yet altogether ill-affected: whereas in the mean time, the gristles, bones, membranes, veins, finews, and bowels, do not wax moyst and are melted, but with a Liquor, if they should undergoe an Ulcer. Therefore the corruption, and tempest of an Ulcer of these, should be far more mild and gentle, than those which do otherwise tumult in the flesh: Because the diversity of a Remedy distinguisheth the end for which it is appointed: and therefore a drying Medicine doth denounce a milder affect, than that which moreover should also be astringent.

Therefore *Galen* and his followers, because they have been hitherto ignorant of the causes, fewel, Womb, subject, efficient, of the manner of making, of the seed and ferment of Ulcers, they have delivered none but ridiculous Curings, Remedies, Maxims, and Doctrine. Wherefore, neither is it a wonder that difficult or malignant, and furious eating Ulcers are not wont to be cured by the Remedies of the *Schools*: and the which, for that cause especially, have withdrawn themselves from the works of Chyrurgery, with the great disgrace of *Galen*, and his own *Greeks* who lived in the same Age, and the *Arabians* their followers, even as I have professedly touched in the Book of the Plague-grave.

For the milder Ulcers, and in those whose malignity is taken away, and while they hasten unto an incarnating and restoring of the hollownes left, they drop down with thick matter onely, and so are reckoned, according to the Rules of *Galen*, more difficult than while they flow with Liquor: But Ulcers already mitigated, are provoked by cleansing things; So far is it, that they are healed by the same. Surely, if things that drie up, and cleanse or wipe off, should satisfy all Ulcers, the curing of any Ulcers whatsoever would be easie: For why is the *Galenical School* so carefully troubled about the choosing of Medicines, when as they do abundantly satisfy both berokenings, with a dry Towel or linnen Cloth? To wit, one onely Towel dries up, and together with it, cleanseth likewise. Let it shame them therefore, and seriously shame them, to diffuse such trifles out of their Chaires, out of their presses, and out of their mouth, for Youth, and Chyrurgions, instead of a maxim of healing; and to dismiss thereupon, these men so instructed, as provided, with the specious Title of a Physitian and a Doctor, to the death of mortals, and the torture of those that trust in them. Therefore it is not sufficient to have wiped away, and dried up the thick or snotty, and liquid matter; but the hostile framer, and corrupter sitting on the part, is to be blotted out; because he is that which doth nothing slacken or wax mild by drying, and cleansing.

Indeed the quality of the seminal mortal poyson, and the poysonous forreign Impression of the Archeal part which perverteth the good venal blood, dispensed unto it, doth naturally shew a withdrawing of it self onely. Therefore the poyson is a certain Ferment and Contagion, implanted in the bottom, the corrupter of the venal blood and flesh.

Therefore the *Schools* may see, whether a Rheume being lifted up in manner of a vapour, out of the stomach, into the plain of the Head, be able to give a beginning and fewel to the same; and whether Cauteries or searing Medicines inflicted at pleasure, are able to satisfy or be sufficient for the same accustomed Catarrhe, instead of Remedies, not onely those that dry up, and cleanse, but also instead of revulsions or repellings, by reason of the continuation of co-knitting, proportion, application, agreement, yea and depending Harmony of the same Remedies in the Root. Truly, as many as are ignorant of the activity, and variety of Ferments, must needs in a blind manner, try, and grope at all things credulously.

There are indeed as many Ferments of Ulcers, as there are diverse corruptions of Ulcers, and distances of corruptions: To which end, the testimony of one bread will very much conduce; because it is that which may be even the Index or Touch-stone of this disputation: To wit, the which hath received as many limitations or disposures in a Man, a Dog, a Cat, a Horse, a Cow, a Hen, a Goose, a Duck, a Sheep, &c. as their differences do issue forth Ferments of bloods, and Dungs, specifically, yea and generically: So also one onely venal blood in the particular kinde, doth support many Ulcers in the particular kinde, their transchanged corruptions, according to the interchangeable course of strange Ferments: And although one onely Archeus be sufficient for generation; yet there are divers means of life, and manners of corruptions; to wit, as many as there are Families of corrupting things. Therefore the full and exact curing of Ulcers, is a taking away of their own Ferment; but not a cooling refreshment of the Liver; nor the cleansing away of dreamed Choler, or liquid corrupt matter: In the next place, neither are Ulcers cured by an application of absterfive or cleansing things, so that by reason of their malignity, their increase may desire degrees of corroding absterfives.

- 31 For Arsenick being fixed by Salt-peter, and dulcified or mitigated into an astringent Sulphur, doth not extinguish, perhaps sixty diversities of Ulcers; because it gnaweth and eats up (for so it should not require a dulcifying of it self with the repeated Spirit of Wine) but because it hath now a mild poyson, which is for killing the very workman of the Ulcer, and the corrupter of venal blood: The which indeed being once wholly dead, the flesh afterwards ceaseth not of its own accord, to grow up from the bottom: therefore the hollownes of an Ulcer doth betoken a growing up of the flesh, and healing up of the Skin into a skarre, to wit, that it being taken away, a restitution may be made: And the which therefore, have the relation of an effect, in respect of the death of the corrupter.
- 32 Furthermore, what Ulcers I refer unto a seminal, and poysonous Ferment, *Paracelsus* after his manner, hath transferred on the minie and saltish minerals of the microcosme or little World: For as Ulcers are for the most part made odious by Salt, he according to his own Idiotism, thought that Ulcers were to be registred in the Progeny of minerals, and in the distinct Families of the same: For I do not give myself to brawlings, as I know, that neither was I born to that end: wherefore I am sorry for the vanity of the man, and for his uncircumspect forgetfulness; As he saith, that man (whom elsewhere by an Etymologie or Zodiack, he boasts to be a drawn Epitome of the whole Universe, and feigneth that he is more glorious by the dignity of that extraction, than by the Image of the Creator) is a most miserable monster, every way formed by minerals alone: He I say, in another place being unmindful of these things, calls the Body of man *Cagastrical* or badly Planet-struck throughout its whole, not indeed, consisting any longer of divers composures of Sales; but to be proud of the structure of the one onely Salt-peter; whence, men are born a hard generation, therefore the hatches of the Earth: For he would, that all Salts, Stones, Minerals, Herbs, &c. should lurk in man, as it were in their own Seminaries or Seed-plots: But that they break forth into act, not indeed by the warmth of confused seeds lurking in a *Chaos*; but only that by a separation of the vital Liquor, that they return from these things which were co-bred with themselves, into their anient Minerals: Not heeding, that it is an absurd thing, seeing he will have the *Macrocosme* or great World, to consist no lesse of Stars and Plants, than of minerals, that it should resolve it self, rather into Salts, than into Plants and four-footed Beasts. Therefore in this matter hath not *Paracelsus* onely forgotten Seeds, Vegetables, Stars, and soulified creatures; but his own self also? That it should be the property of a Seed, from whence that heap of venal blood is separated by mans vital Beginnings, to return rather into this, than into another mineral? For as *Galen*, endowing all things with heats, and feverishly doating, drew for some Ages, the chiefdom of healing into himself; So *Paracelsus* reducing all things into an under-earth off-spring, being proud of his pretious household-stuffe, grew mad a while, and thereupon aspired into the same Principality. But I pray, who is that separater, which withdraws and plucks away a part of himself from the Balsam of life? in the next place, who is that corrupter, which had changed the part plucked off from a vital condition, also into a mineral Salt (which knowes not how to putrifie in it self) or into a hidden metal, credible onely by belief? Dost thou not, concerning long life, call death the dominion of the Balsam? How is it therefore, that thou now callest death the separation of the Balsam? Or who is the seminal distinguisher, in the Zodiack of man, which may wrest the one onely, and the same Liquor from the Balsam of life, sometimes into Alumé, and at length sometimes into Arsenick? Truly *Paracelsus*, after that by a laboursome and ridiculous diligent search, thou hast heaped up great Fables, because thou hast been ignorant of Ferments (whereunto notwithstanding, thou shouldest have come, as to the active, and seminal principles) thou hast past by the Beginnings of Nature; and sporting with the Zodiack or compass of the microcosm at thy own pleasure; hast made thy self ridiculous to Posterity: For a full knowledge of the ferments doth finde out an easie way to know, take away, overcome, and separate the poysons of any Ulcers whatsoever: For whatsoever is made in the course of Nature, that is made by the necessity and guidance of the seeds, and is moved unto the last period of them: But not from the lot or condition of a resolved dead Carcase, or the naked will of a slain or groveling part; The which indeed, should hasten from a privation, by rising again into its former Being. Away with thy trifles: For we have no fountains of Salt, no reducements of venal blood into feigned and lurking mettals. Neither are there minerals in us, which by wantonizing, do withdraw themselves from the vital Beginnings, or which do expect the withdrawing of these: to wit, that they should return from mans essence, into their anient and appointed minerals, that so they may become the wombs and springs of Ulcers: Neither also, are there microcosmical Lawes in us, any more than the humors of four Elements mutually agreeing in us, and the fights or grudges of these: For with *Nazianzen*, I cannot tie up man unto the sporting Rules of a Microcosme: For I had infinitely rather to be the Image of God, than

than the Image of the corruptible and torturing World : for although man doth grow and increase with Beasts, and Plants ; yet Beasts shall not therefore be the Image of Plants : So although man do feel or perceive, and be moved ; yea discourseth, together with Beasts ; yet nothing speaks but a man ; Because an Angel neither stands in need of speech, as neither of the Instruments of Seed : But if a Bird seem to speak, he imitates onely the tone, and distinctions or significations of speech : for there are not in us Hails, Snowes, Rocks, Stones, Metals, Marbles, Flints, Gems ; as neither that Center of a World whereunto all weighty Bodies do incline : Neither is there in us a Stone, by Creation, neither are there particular kindes of the red or purple Marble, Jasper-stone, &c. and the stone in a man differs from a true stone, no lesse than a Pearle doth from a Cow : for a Pearle is indeed changed into the flesh of a Cow ; sooner than the stone in a man can decline into a Mineral Rock or stone. The name therefore of Microcosm or little World is Poetical, heathenish, and metaphorical, but not natural, or true. It is likewise a phantastical, hypochondriacal, and mad thing, to have brought all the properties, and species of the Universe into man, and the art of healing : But the life of man is too serious, and also the medicine thereof, that they should play their own part of a Parable or Similitude, and metaphor with us.

Last of all, *Paracelsus* is wholly ridiculous, who teacheth that an Ulcer, and a wound are 34
nourished by Herbs, Balsam, and Oynments ; So that these defects are nourished by Remedies, with a true nourishment, and severing of excrements, and that thereby the lost flesh of them, is truly, actually, and immediately restored ; and that, he hath seemed seriously to have written : which thing surely, I willingly grant unto his own Idiosyncrasy or propriety of speech. At length, for the curing of Ulcers, there is use for Colcorar or calcined Vitriol, 35
being diversly applied according to the difference of the Ulcer : For oft-times the Wine wherein it is steeped, doth by its washing, do that ; or else the Powder thereof, after an exact separation of its Salt ; and sometimes being boyled in the Oil of Line-seeds, even unto a blackness, which is for the foundation of the Oynment of successful *VVurtz*, in wounds. But I say enough to the curious : To wit, that Colcorar doth kill every corrupter of wounds. Finally, for a wound, know thou, that the very separation of that which held together, is indeed the immediate, and sufficient occasional cause, to wit, as it openeth, beats in 36
pieces, or bruisseth, &c. Every separation also wants a confirming closure, and is presently glewed together by glew dissolved in Wine, because it is prepared of the Skins of living creatures ; Especially if the Glew be of the hide of a man dying a violent death, that is, he being slain in his full strength : But the alterations of the Archeus from venal blood largely poured forth, and a conceived Idea of another revenge or indignation being bred, which by a proper name, I call our wounds, and not anothers ; or those wounds which are inflicted from without, do not onely stand in need of a co-glewing of that which is discontinued or separated ; but an appeasing of the altered Archeus : For hitherto have Oils, Balsams, emplasters respect, which may procure the peace of the implanted, and local Archeus being injured : To which end, the Balsams of Rosins, flowres, and herbs have arisen, and likewise those which are prepared of *Minium* or Red Lead, Cerusse, or Colcorar : Hitherto also doth the Salt of Tartar tend, being rectified by the Spirit of Wine, until it obtains an astringent taste : For it is the Balsam Samech or of Tartar, of *Paracelsus*, even as out of Arsenick for Ulcers, whereof, moreover, there is its Balsam of smoak ; because that Arsenick is by skilful men accounted the fume of Metals : Not indeed, that it is not simple, born, and subsisting by it self ; but from a Similitude, for that metallick smoaks do imitate an Arsenical malignity. And so I close up the Doctrine of external Diseases.

An unknown action of Government.

1. The Maxim is opposed, That of Contraries the Remedies are contrary.
2. The foundation of that Maxim.
3. The Maxim concerning the re-acting of the Patient, or of its defence in time of fight, is examined.
4. Arguments on the opposite part.
5. The same, by moving strengths, by things generative, and irregular.
6. There is no re-acting of weight.
7. A rebounding action neglected by the Antients.
8. Bright burning Iron acteth, and doth not re-act.
9. The swiftness of a mover is not the action; but the measuring of the action.
10. Altering Agents do not properly re-suffer.
11. Another Maxim is noted of falshood.
12. From whence the falseness thereof hath issued.
13. What Agents of a different inclination and irregular, are.
14. He proceeds to prove what he hath undertaken to prove.
15. Wherein the opinion of Aristotle may be preserved.
16. An explaining of action in the slowness of the fire.
17. Actions on an object separated from the thing supposed.
18. A Formental and radial or beaming action.
19. That these kinde of actions are not to be referred unto the fault of vapours.
20. The Blas of Government hath been hitherto unknown.
21. The falshood of a Maxim.
22. The fire suffers nothing by a burnable object.
23. To determine or limit an action, and to re-act, do differ.
24. New actions.
25. The dimness or giddiness of the Schools.
26. Their staggering.
27. Likewise some neglects of the same.
28. The unknown action of Government is not that which they call an action by consent.
29. The Error, whence it is.
30. Why Anatomy hath arisen into so great curiosity.
31. How much may be required from Anatomy.
32. A neglect of the chiefest part of natural Philosophy.
33. The Schools deluded by thinking.
34. Many things happen in us by the action of Government, without conveyeing Pipes or Channels.
35. Blindness hath brought blinde persons unto blinde vapours, the action of Government being unknown.
36. Things admitted by the Author.
37. The action of Government is abstracted from a co-binding mean.
38. A natural action in incorporeal Spirits.
39. which is a juggling action.
40. Luxury takes away the Remedy of the Horse-hoof.
41. An Example of Government.
42. The government of the Womb is wholly over the whole Body.
43. Government acteth into its own marks, the middle spaces being untouched.
44. The faculties of the actions of the Womb.
45. The furies of the Womb.
46. The manner of making in the birth of a Disease, from the action of Government.
47. Why the fore-head is not bearded.
48. That Capital Diseases do not arise through Fumes out of the Stomach.

1. **F**ROM the first time wherein the Schools placed contraries in Nature, they presently universally established, that nothing acted without strifes, war, and discords: Even so that all chidings, hatreds, emulations, have been reckoned the Foundations or Principles of Nature, no lesse than self-love. And moreover also, they being credulous of hatred, by the persuasion of Astronomers, have introduced the same things into the courses or dances of the Stars.

2. Likewise they have determined, that in the whole sublunary frame or stage, nothing is done, or generated, but by a Relation of the Superiority of an Agent unto a Patient; So indeed, that the Patient is with violence compelled, ramed, altered, destroyed, and is wholly translated into the Nature of the Agent, onely by the relation of a stronger on a weaker. But when

3. the Schools saw, that Agents did by degrees languish away, either through space of time, or

weakness of acting; they likewise decreed from thence, that that indeed, did not so much happen through a tiring out of the seeds; and powers, but by a re-acting of the patient: Therefore they confirmed it, that every patient or sufferer doth likewise of necessity re-act, and for that cause likewise every agent or actor doth re-suffer; neither also that it is any other way weakened: Whence by consequence, I guessed with my self, that sometimes the seeds of things shall at sometime be naturally, wholly, undoubtedly extinguished, unless they are miraculously preserved: Notwithstanding, I do even contemplate, that there is on both sides a perpetual rudeness, and continued sloath of a diligent search, in the doctrines of the Schools: And that one onely thing hath repelled from me the former fear: For truly, after that I with-drew contraries out of Nature, I could not afterwards, in sound judgment, find out any re-acting in the patient, as neither could I admit of hostilities in nature, elsewhere than among soulified or living creatures: For contrariety is in those things alone, wherein there is an actual defence in the will of the patient against the injuries brought on it, and felt from the Agent: Wherefore there is never a re-acting of the patient on the agent, unless where there is a contrariety conceived in the soul. But that this is thus ordinary, and ordained in nature, I will forthwith demonstrate: For first of all, the Universe should remain still, even as it now subsisteth, by the infinite power of the Word, if it should be so commanded; I say, things should be infinite in their own successions, and duration, but they should not be infinite by an actual virtue of the unity of a creature: And that thing, because it is of faith, it wants no proof. Therefore there is no infinite of sublunary things by their own power. Hence it follows, that at length every particular Agent doth by degrees also of its own free accord, at some time decay, and having finished its offices, dies by a dissolution of its strength circumscribed in space of place, and in the power of continuance, & strength, unless perhaps the appointed day of its proper and limited period or conclusion, be shifted off by a preventing of the term, or the impediments of the object. But of natural Agents, some are those which have a motive force, which I have called a motive Blas; but the Agents themselves I call moving strengths. But other moving Agents, I call an alterative Blas, to wit, those which do operate by the seminal force of a ferment: And such Agents do for the most part generate their like. Lastly, in the third place, some Agents are irregular, or of a different inclination. I will speak of those three in order. Indeed acting strengths do act on their objects; First, by a prevailing weight. Secondly, by a round, angular, sharp, hollow, &c. figure. Thirdly, by the hardness, softness, &c. of a Body. Fourthly, by an impressive Blas by the hand, a mallet or hammer, needle, &c. Fifthly, by swiftness; for unless a ram or Engine be swiftly smitten against a wall, or a hammer against a nail, although the impressive force may be strong, yet the Blas or motive power thereof shall be slow or sluggish. Sixthly, By the hinderance of a Vacuum or emptiness. Seventhly and lastly, By the fear of piercing of Dimensions. But that moving strengths do re-suffer nothing by their objects, it is manifest: for first of all, in the sixth and seventh of the aforesaid Particulars, the nature of the Universe doth rather operate, that things may not be, than that they may operate while they should be, and much less do they re-suffer; because an Agent doth not re-suffer by an Object, which as yet is not; seeing that which as yet is not, cannot as yet act, or suffer again by action. But in respect of the first particular, to wit, that the greater weight cannot re-suffer by the less, by any action of the lesser weight, is manifest: Because the lesser weight being oppositely applied, doth not argue any re-action on the Agent; but that is made by reason of a limitation made, either by the space of place, as in a far removing from the Axle or Diameter of the world; or by reason of the measured action of the greater weight; which, that it is not a true re-acting, I thus prove: The lesser weight suffers nothing simply and absolutely by the greater whereby it is elevated; therefore neither doth the lesser weight re-act any thing, although it be lifted up, and yield or give place: Because the less weight doth onely limit the action and heaviness of the far stronger weight, as every Agent is of a finite and limitable action: But that such a limitation is not a re-acting of the lesser weight, is manifest; for the same lesser weight, remaining as much as it is, is made greater, while it is estranged or far removed from the Axle.

Therefore, if there should be any action, or re-acting in weights, in the case aforesaid, it were to be attributed to the space of place, and not to the heaviness of weight; seeing that one and the same weight is various, and manifold at the will of the Artificer, onely by the space of place: But the space of place, or of far removing, is a certain external thing as to the essence of weight, and plainly accidental by accident: And so, neither can it give a true and proper action, or re-action in weights: Therefore the limitation of actions in weights, is not the essential and proper action, or re-action of weight on weight: Even as also space, or distance of place, hath not any internal force, or essential

essential Blas of local motion, on a bullet sent out of a Gun; but it onely limits the finite force of the imprinted motion; so as that, through distance, the attained Blas of the bullet doth by degrees necessarily languish: For it is certain, that the bullet doth operate into the middle distance, the which I understand, that the bullet hath no activity on the middle space of the place it self, although this notwithstanding doth to limit the Blas, or motive power of the bullet, that at length it may perish, because it is of a finite power: Likewise also in weights, the greater weight is indeed limited unto a certain measure, and power, by the lesser weight, but that limitation is not the true action of a certain Agent, if local motion be limited by place it self (which is wholly external and accidental to motion) without re-acting, or if it doth voluntarily languish by a continuance of motion: But if place, and continuance do not suffer by the motion which is made in them; that is, that the motion doth re-act on the place, and duration; therefore neither shall there be any true action of the place and duration on the motion, although the motion being finite, doth voluntarily cease in place, and time. It belongs nothing therefore unto a re-acting, although the lesser weight doth limit the greater unto its own certain and designed bound. Therefore, it from hence is clearly enough manifest, that very many things are reckoned to be agents, and re-agents on each other, by reason of the hidden frailty of us in understanding, which in very deed do neither act on, nor suffer by each other, and likewise do neither re-act, nor re-suffer reciprocally: For truly the action whereby the greater weight doth lift up the lesse, and this gives place to the greater, and likewise whereby the greater is limited, and lessened by the lesse weight being opposed, the which otherwise, being opposite to the greater, doth increase this, is not a true natural action, or power of seminal properties, but relative respects of learning by demonstration, or Science Mathematical, according to place, duration, greatnesse, &c. which things are plainly external unto natural Agents, and by accident: But actions and re-sufferings in nature are considered in a true and intimate conjoyning of forces; which in the things abovesaid have no place. But that I may shew, that those respects of Science Mathematical, have not an action issuing from the powers of things, but onely the relation of Science Mathematical (every meer action whereof, although it be made by bodies, yet it is not the action of the body it self, as such) it is sufficient to have shewn by the aforesaid particulars, that the limitation of motions do far differ from the inward activity of motions, according to which, things are judged by the Antients, to re-suffer, and re-act in every action: For so there are many impediments in nature, which although they do limit, yea and also plainly take away the force of the Agent, yet they are not to be judged to re-act: And so, we must speak most properly, when as the essence of things concerning the properties, and actions of those things, is to be distinguished by a natural Philosopher, especially when he treats of the necessities of life: For the lesser weight doth not resist, and much lesse doth it re-act on the greater. But every thing weigheth freely as much as it doth weigh, without respect of one weight unto another: But if man opposeth one weight to another, that is a humane thing; neither hath the action of weight a mutual respect: For from hence, what things I have demonstrated above, against the contrarieties of active Bodies, do more clearly appear: For truly, every Agent, in manner of a greater weight, acteth freely, and without respect to contrariety; but it acteth that which it is commanded to act in nature, and as much as is permitted unto it to act: Therefore weight, or rather a ponderous matter, weigheth in it self, as much as it doth weigh, absolutely and without respect unto another greater, lesse, equal, proportioned, &c. weight. For such respects are of humane industry, which by reason of co-handlings or commerce, findeth out measures, as well according to extent in length, breadth, depth, &c. as in the division of weights; to wit, it hath appointed Axles of Diametrical distances, and far removings; so that all the consideration from thence is artificial, and therefore also changeable in the samelnesse and unity of one body: And therefore weights as such, do never act, or re-act on each other naturally, or by a co-mixture of their own properties, although they seem to act something artificially: For so the light suffers nothing, although the continuation of light be hindered by a suffering wall: For otherwise, if the lesse weight should in very deed re-act on that which out-weigheth it, the weight it self should be rather lessened in the thing weighing, for a continuance, and actually, and not only with respect to the ballance; so that a pound thenceforth should not any longer weigh a pound, as before: And seeing nothing is changed, or taken away from the weights on either side, it is manifest, that there are onely artificial relations of moving strengths, but not a true re-action of the lighter weight: For as long as a pound doth weigh a pound, nothing is attained, or hath suffered in that pound by another opposite weight; but on both sides, one is external, foreign, by accident, to the other, and limitable by a relative foundation, that it may be readily serviceable to humane considerations: And whatsoever thus acteth in our power, or seemeth

meth to re-act, acteth in very deed, nothing. But as to that which pertaineth unto other moving strengths; If an impressiv force of strength doth act indeed by it self, but in the mean time be limited by space of place, duration, or be weakned by impediments, or lastly, if it act measuringly, by reason of figure, and hardnesse; at leastwise, there is never in these, any re-acting of the patient, or re-suffering of the Agent. For example, If any one smite on an Anvil with his fist, and thereby receives a wound, or bruise, there is not in that stroak any re-acting of the Anvil, or operation of hardnesse, or of a corner in the Iron; For although the hardnesse doth resist, repulsing the smiting fist, and the bounds of resistance or repulse may seem necessarily to include some kind of force of re-acting; yet it is an improper speech, proceeding from the popular error of the Antients: For that is not the re-action of the Anvil, but it is the very action of the fist it self, which I call a resulting or rebounding one: For if the Anvil should truly re-act by hardnesse, seeing there is no reason why the Anvil should impart, act on the fist, and should expect a stroak, that it might act; for it ought by its whole hardnesse, and weight together, to act also on a quier hand, and from that very deed done, plainly to fret or tear it; Neither should the action of the Anvil be limited by the strength of the stroak, if there should be a re-acting of the Anvil it self: For truly the same thing should happen to the fist, whether it had smitten it strongly, or in the next place, modestly, or if at length the opposite fist should rest on it onely; because that in either act there was the same hardnesse of the Anvil: Wherefore, that hardnesse of the Iron acteth, or re-acteth nothing by a proper power of acting: For there should be a force in the Anvil, which in re-acting should be seated throughout its hardnesse, and in any stroak should act alike equally, and according to its full power, but not according to the measuring of the striking fist, which is altogether a stranger to the Anvil. Therefore in truth, the fist doth act simply on the Anvil, and the Anvil suffers simply, although it took no offence thereby; but the fist suffers by accident, if it do the more strongly strike: the Agent of which suffering is notwithstanding, not the Anvil, but the fist it self: Because there is one only and single action of the stroak, and hurt, which I therefore call a rebounding one: And so the fist suffers, and is hurt by it self, from its own self; but by accident from the strength of the stroak, and occasionally from the hardness or figure of the Iron: which three things are to be noted in one only stroak: For truly, that which by accident, and occasionally acteth externally only, doth not in very deed act by an action of its own; and therefore neither is there any re-action, as neither action of the Anvil: But the smiting, and hardness are the occasional means of the wound; one whereof (to wit, hardnesse) is a proper, occasional, and internal thing; the other (to wit, the smiting) is accidental by accident. In the next place, there is another action of a moving strength, which hath deceived many with the title of re-acting; as while a hand layeth hold of bright burning Iron: for the hand in laying hold, doth in very deed act, and that by it self, and the apprehended Iron it self doth suffer in the laying hold: but this doth likewise act by a new action indeed, but by a far different action in burning the hand: for neither is that the scorching of the Iron, as being comprehended (although that touching be an immediate occasion and cause, without which it is not done; but it is the proper action of the Iron, as being burning bright: for so, touching, and scorching are Beings wholly distinct, and separable in the root; and so also both their actions differ in their objects, though in time of acting they do now and then co-unite: Therefore the searing is not a re-acting of the Iron, as being laid hold of, or it is not the re-acting of comprehension: Although in both the sorts of action, the acting hand becomes a sufferer, because two actions wholly unlike, do concur; to wit, one of the hand laying hold, and the other of the Iron burning. Again, swiftnesse, while a Ram or Engine is sore smitten against a wall, is not the proper activity of the Agent, but it is a measuring of strength imprintingly moving, and so is external and by accident. Now, as in respect of Agents by an altering Blas, those do undergo not any thing of re-acting from their own objects, because they generate by an absolute dispositive power of their objects; which power, seeing it is conferred on Nature by God, it also acteth without a re-acting. For example; If the whole Globe of the earth, and water should be of meal, all that heap would at length be leavened by a leaven of bread being once put into it, which verily could not be done, if there were but the least re-action of the fermentable body: For the small quantity of ferment or leaven should be presently choaked by the more big heap of the Object; even as also the seminal spirits do dispose the subjected lump, by reason of a faculty conferred on them, and in-bred in them, and do by a famous prerogative alter it, and that without the re-acting of the subjected heap: Neither doth that hinder, because the stomach cocting the more hard meats, is felt as it were, to re-suffer, and to undergo a re-acting of digestible things; because also, that speech of Physicians is too rustical; because, unlesse that which is to be digested be perfectly cocted, and at a
fer

set term of time; the digestion of the same is in vain expected: for it tarrying longer in the stomach, is corrupted, and so then a new Agent ariseth; neither is the former any longer digestible, when it is corrupted; neither also doth that new Agent re-act in manner of bright burning Iron, because there are in that digestible matter, parts incapable of digestion, in respect of that stomach: Neither also doth the leaven or ferment of bread leaven the powder of glasse, or the sand of a flint, because it is a strange and incapable object, and not to be subdued by it: For so the digesting ferment of the stomach doth ferment the flour of meal, but not the brans: In the mean time, the ferment of the meal suffers nothing by the powder of glasse; as neither doth that powder re-act, resist, or truly repel: For truly, altering ferments do never act, but on things that have a co-resemblance; but they are quiet, do cease, and sleep, if they have not an object proper for themselves: Therefore the hinderances of Agents by an alterative Blas, are incapacities, hardnesse, impurities, unequalities, and the requisite movers of space: Therefore the action of these is terminated on a proper object, and disposeth that object unto periods or ends, and manners decreed for it. But interposing hinderances are not the re-actions of the patient, but the incapacities of the same. For neither doth silver re-act, while it is solved by *Aqua fortis* with so great a heat, although this in the mean time, decayeth in acting, and loseth its own force and virtue: but there is an in-bred property of Spirits, and a natural endowment, which do operate in acting, that by reaching unto their appointed mark, they may perfect themselves, and bring down their own objects unto bounds naturally enjoyed them; which thing distilled Vinegar doth sufficiently teach, while it dissolves the stone of Crabs, Snails, Corals, &c: for the sharp spirit of the Vinegar doth coagulate it self in acting, and that which else was volatile, and liquid, is not onely strained together, but also changeth its savour; for it collects and constrains it self in a tangible form, as if it did more rejoyce to remain in the shape of a more solid body, than of a liquor: But that such a coagulation, and change of savour doth happen by the proper motion of the spirit of Vinegar, but not through a re-acting of Bodies standing in the act of dissolution, is manifest; because there is not made a diminishing of those Bodies, even in one grain at least, in weight; while as in the mean time, some measures of stilled Vinegar do undergo the aforesaid change: and so it doth not seem consonant to reason, for that thing to be done, by reason of the bruising or breaking of the stones onely, but by reason of a proper natural gift-like unfolding of the Spirits. The same thing almost comes to pass, while the Spirit of Vitriol waxeth very hot with Mercury: For the Mercury remaineth, being unchanged in the essence and matter of Mercury, onely that it assumes the countenance of snow; losing in the mean time nothing of its own substance, yet the Spirit of Vitriol passeth over into a true Alume; but if the Spirit of *Aqua fortis* (which for the other half of it, is also the Spirit of Vitriol) be combined with the Mercury, that snow of Mercury is not made, as neither doth the liquor it self pass over into an Alume: And so from hence it appeareth, that the action is not proper to the Mercury, but to the Spirit of Vitriol diversly disposing it self of its own free accord; and according to an in-bred inclination unto divers objects, differently changing it self: Wherefore the Spirit of Vitriol which is in the *Aqua fortis*, through a strong heat of bubbles stirred up, and a tempestuous boiling up, dissolveth the Mercury, and far otherwise, than while it is the naked and simple Spirit of Vitriol; which variety indeed, in acting, doth manifest the various virtues of the acting Spirit, rather than those of the Mercury it self; because in the one action the Mercury is made invisible, which in the other becomes white like snow: For the Spirit of Sea-salt, although it be most sharp, yet it is never changed by the fellowship of Mercury, as neither also doth it act into the Mercury: And so the effects of actions are seen, and not of re-actings: So *Aqua fortis* acts into all metals, except gold; but with *Sal armoniack* it acts only into gold, but no longer into silver; And so there are particular properties of Spirits, but not re-actions of a suffering body; because it is that which in its own substance and weight, sustaineth nothing but a meer and one onely division of it self: Therefore Spirits being tossed with divers passions in acting, undergo divers transformations; but if they remain drowsie and sleeping, and do not act on their object, they also remain in their ancient qualities: For that thing appeared at first to happen, by reason of the touching of the Mercury, because it is that which is also a certain Spirit, but afterwards in the silver and gold, that was wholly silent. But moreover I remember, that the Calx or lime of Silver hath drunk into it the liquor of Sulphur, which they call a distillation, which presently in the Silver laid aside all harshnesse and tartnesse, and it changed this liquor into a gaully bitternesse, by distilling: for the silver remained the same which it was before, in substance, weight, and powder: therefore that bitternesse could not be afforded from the silver; and for that cause, in no wise, from a re-acting of the silver; but of its own free accord it was made by the property of the spirit

Spirit of the Sulphur: for neither is there a lesse reason, why the same Spirit of Vitriol, in diversly acting, doth also change it self after a diverse manner, than that the same silver should under the boyling up of diverse Spirits, wax cruel, by a various manner of re-acting on these; Especially while that in a Spirit, there is made a various transmutation in acting; but there is no successive alteration made of the substance of the silver, in suffering, or diminishing of its weight: which things may be far more clearly demonstrated by Adeptists, unto whom, to wit, the one onely and same Liquour Alkahest, doth perfectly reduce all tangible Bodies of the whole Universe into the first life of the same, without any changing of it self, and diminishing of its virtues; But it is drawn under the yolk, and thorowly changed by its own compeere or co-equal onely: For from hence there appeareth a certain sence to be in all particular things, the which mediating, they do sometimes one way, and sometimes another, move and unfold themselves about divers objects; but not that the period of motions, and of those unfoldings, and the variety of Agents, is therefore to be attributed to a re-acting of the Patients; To wit, even as, while an external luke-warmth bringing up Eggs unto a Chick; for neither of them doth re-suffer reciprocally: For neither doth the vital Spirit in an Egg any way re-suffer any thing by the luke-warmth, as neither that luke-warmth by the vital Spirit of the Egg. Hitherto rendereth that which I have proved before; To wit, that altering things do not act by contrariety: Therefore their Patients do not fight in defending themselves, nor re-act by contrariety.

That maxim also is false, *That every Agent doth of necessity, act in an instant; and that its action is retarded or fore-slowed onely, by a resistance and re-acting of the Patient:* Because in all particular seeds, their own, and certain period of continuances and dispositions is essentially included. For the falshood of that maxim hath flowd from hence, that the Schools being deluded by *Aristotle*, have thought that the fire is to be compared unto other Agents: the which, when they saw to be any where, almost in a moment, they believed that the same thing was likewise to be wrested unto other Agents: Through occasion whereof, I must now speak of irregular and differently inclined Agents.

In the first place it is manifest, that the fire doth suffer or undergoe nothing at all by the re-acting of a combustible object: For otherwise, a small quantity of fire should be sufficient for the burning of the whole Universe, if it were capable of burning: which could not be done, if the combustible matter should re-act even but never so little. Truly a River suffers nothing, if a staffe shall swim on the same, and as yet lesse doth the fire suffer, if it burn *Saguntum*, or if Gun-powder be fired. In Nature also, no seminal Beginning suffereth by the matter into which it works; Because it disposeth of the same without re-acting, even as it hath begun plainly to appear in denied contraries.

Moreover, that the falshood of the aforesaid maxim may be the more beheld, take notice, that all particular seeds have their own periods and moments appointed by the Creator, wherein they do promote their course unto a ripeness: For Conies, Dogs, Birds, Men, Horses, Elephants, do nourish within, perfect, and bring forth their own Young, at their appointed termes of time: Not indeed, that the seminal matter in a man, is rawer, colder, and more rebellious than the seed of a Cat: But God hath set the bounds of every one of them, according to his own good pleasure, the reason whereof to enquire into, belongs not unto mans judgement: For if the disposition of a seminal matter be of a longer labour, that proceeds not by reason of its resistance or struggling strength, as neither from the weakness, wearisomness, idleness, or disturbance of passions of the Agent: For truly, every Being in Nature operates without labour and passion; and therefore without cessation, rest, intermittency, and trouble; Seeing indeed, all particular things are made by reason of the communicating of a Ferment, and limitation of appointment: For all particular things do purely operate by a reflexion of their own appointment, according to the ordaining will of their Creator: For so Christians were to philosophize. But in local motion, motive virtues, and so also in the exercise of Science Mathematical, the maxims of *Aristotle* are indeed serviceable, the which, by a violent Command; and unfitly, the Schools have introduced into nature: For if moyst or wet Wood be not so obediently burnt up, as dry; that doth not therefore come to passe through a re-acting of the wood, or with a suffering of the fire: For although the wood should cease from all combustion, the fire should not therefore suffer more by the wood, than by Gold, which is not to be burnt: yea if in wet wood, as such, there should be a certain operative resistance, to wit, a re-acting; surely, water should also longer, and more strongly resist fire, than the Rosin of Wood, or of a coal: But the consequence is false: For the water doth most swiftly, and first of all fly away out of wet Wood, before the fire enflames the Rosin of the Wood: Therefore the slowness in wet Wood doth not argue a re-action of the matter, or strength of the suffering Wood; But the fire follows its own laws of appointments, whereby it separates first the more volatile things, and next in order, things lesse swift of flight: For so, although the fire be subdued by wet Rosin, which by it self otherwise, had presently been in a flame with the same fire; yet by reason of

the aforesaid lawes, it patiently expects the torture of the fire, and a departure of that water.

- 18 Iron also being placed between stubble and fire, hinders indeed the enflaming or burning up of the stubble; but there is not therefore any re-action of the Iron on the fire, or suffering of the fire by the Iron: which thing surely hath not been narrowly enough searched into by the Schools; For although these their maxims have place in corporeal actions, wherein the Agent of necessity, cherisheth and toucheth its own object, and thus far inspireth its own virtue into the same; yet that is altogether impertinent in Agents which do act on things placed under them, which are far separated in place: For truly, besides the actions of the Heavens (which are carried by influence, in-beaming, and motion, without the touching of an Agent; but by a Blas onely do disperse the Seminaries of their own virtues) Sublunary things are not properly deprived of a Blas:
- 19 Because fermental Odours, do produce most active, and seminal effects, and do transchange, in nature, their object, by their own perfume, and do draw it after them into their protection. Likewise also a radial or beaming action doth concur into nature: For the Elks hoof is thus said by its touching, to preserve the heart, and head from danger; yet the Seat of the evil is not in the finger, as neither is there a passing from bound to bound; Neither is the Hoof therefore diminished of its strength by acting; but rather is confirmed, as also the Load-stone is comforted by the communication of Iron; For a clear sign, that an Agent suffers not a whit by re-action, in seminal, or beaming actions, and by consequence, that neither doth the Patient therefore re-act. Therefore Medicines against the pain of the Head, or Amulets or preserving Pomanders, have a Blas, whereby they do constrain objects to obey them, like the Heavens, and they act onely by their own, and not on a strange and nearer object: And they draw out their defects or worthy virtues, without all corporal efflux, motion, passion, or weakening. I know indeed, that the Schools do not bear these things; but that they refer these effects into vapours lifted up from the womb, or the least toe; because they are such, who have sunk themselves in the Clay of a dreggy Minerva or wit.
- 20 But if a Maid which hath the Mother, doth perfectly see all things, at least but on one side, or on the other half onely, she also seeth onely half the Needle which she holdeth or presseth with her fingers, however she may turn her eyes and head: She may see I say, many folks being collected into a Company, but even to her Girdle, or half-sided ones onely: shall perhaps then the vapours be divided in halves, the Apple of the Eye nevertheless, appearing entire? can these vapours I say, permit her to see and discern many things together; but all things apart, in the one, or other half onely? But an incorporeal Blas of government hath been neglected by the Schools, which acteth without a corporeal efflux, even as the Moon makes the Sea to swell: For in the strangling of the womb, they complain as long as they are partakers or Mistresses of talk, of the stretching out of the spaces between their Ribs, and they think that the Girdle they are girt with, is tied to their Ribs, or that a staffe is extended from their neather parts, unto their Throat, &c. Consider I pray, with me, oh ye Schools, that there is in us a double motive power, and decline from this your thred-bare maxim; To wit,
- 22 That the action of the same power is hurt, whereby the sound one is exercised: For truly there is in us a voluntary Blas, and the Blas it self of the parts (as elsewhere concerning Convulsions). Take ye notice; That at least, in this place, if voluntary motion be natural, the will also suffers nothing from the muscles moved by it self, yea, neither from the muscles refusing to be moved: Not in the next place, therefore, that there is a weariness of the faculty; but onely of the Body, or Organs: Lastly, that the muscles being moved by an importunate Blas of the parts, there is not a wearisomness of the parts, although the pain be heightened, and they do not feel their own weariness; because convulsive motions being stirred up by the Blas of the parts, are made by a faculty which becomes mad, and for this cause they are scarce felt or perceived.
- 23 For neither doth that prove, because moysture in Wood, or an interposing of a coal between the flame, and Rosin of the intrinfecal Wood, do foreflow the action of the fire, that it may not the more swiftly consume the Wood with its devouring: For truly Impediments do not act properly, as neither do they re-act; but they do purely and simply suffer.
- 24 They do indeed some way limit the very action of the fire, or do seclude the same, as it were uncapable partitions, and no more: For it is proper and natural to fire, first to consume water, and the more light discussable things, into vapours, before it in burning, do enflame Oily things; At length, after Oily things, to consume the fat which hath more fixedly remained in the coal: But neither doth the water re-act against the fire, or doth the fire suffer: For whether water be in the Wood, or not, the fire doth alwayes act univocally or singly, and according to the appointment of its own nature, acteth freely, and in such a manner, as that it convinceth the aforesaid maxim of fallhood. Also Gold, Talck, Marble, &c. do not re-act on the fire, although they are not consumed or wasted by the fire: For the manifest incapacity of these, hinders it, by reason whereof, the fire doth nor act on those by an ordinary burning or enflaming: For truly, the fire intends to enlighten those Bodies,

in themselves dark, so as that they may be after some sort, made clear or shining bright: the which, at length it obtains in making them fiery: Because the fire endeavours to pierce all things with its own form: The which, while inflameable things do not sustain, without their own ruine; therefore, in burning, they are enflamed, and being consumed, do depart: Neither also doth the fire pretend to enlighten stones and mettals in a moment, according (as otherwise) to the aforesaid Maxim; but the fire suits it self in its own nature of acting, according to the limitation of every object: And so it is perpetually true, that every natural Agent acteth, and is received after the manner of its own object receiving. Therefore the primary action of the fire is to produce in its object, a fire like it self; wherein some objects do burn under the intention of fire; but others do persist, and expect the last intent of the fire: So that, if some things are not combustible; at leastwise, the fire acteth into them as much as it can, to make them fiery. In like manner also, the light suffers not any thing, although at one onely instant, it dart it self from the Sun, from far, on the Earth, or although it be not sent thorow, through a thick mean hindering it: Truly the light suffers nothing by a thick or dark Body, whether it shall passe thorow that Body, or not: For it alwayes attaineth its own intent, which is to enlighten, whether in the mean time, an Impediment doth interpose or not: for the resistance, or repelling of objected Impediments, are not in manner of a re-acting (because Agents re-suffer nothing) but they are of a meer incapacity: Therefore it is plainly indifferent, and by accident unto those Agents, whether fixed Bodies are enlightened only, by the fire, and are pierced by the light; or not: For these things are even after the same manner, as the Leaven of Meal in respect of the powder of Glasse: For the Leaven suffers nothing, although the incapacity of the Glasse doth hinder whereby the Leaven doth work the lesse: For at least there is no re-acting where there is no action. These things about the denial of re-acting, strife, hatred, and war, between the Agent or doer, and patient or sufferer; to wit, which kinde of action alone, the Schools have acknowledged.

I will add also, other new ones. I have said in the Book of Fevers, that a poysonous excrement in Fevers, is included in the Midriffes, producing drowsie sleeps, doatages, &c. Therefore it is an anodynous or sleepifying, and mad poyson. Likewise in Falling-sicknesses, that there is an unsensitive befooling, and mad poyson, afflicting for a space, being entalld in the Midriffes. In hypochondrial madnesses, that there is a furious poyson, or that which doates with jesting or merriment. In giddiness of the Head, a whirling poyson. In the Apoplexie, that which takes away sense and motion.

Lastly, in swooning, a stupefactive or sleepy poyson, a dispersive of the Spirits: And hence, presently taking away sense and motion. But seeing the Schools do not extend themselves beyond a rudeness, they have thought that the occasional matters of these Diseases, is the matter [whereof] of Diseases; and that it is brought thorow the Veins and Arteries, from beneath, upwards unto the Brain: which thing nevertheless, I have refuted, for the exposition of that Aphorisme: *If in a continual Fever, after yellow Urines, watery ones shall presently succeed, they denote doatages to come*; by reason (as Galen will have it) of Choler snatched into the Brain: But the Schools elsewhere, when they noted that from yesterdaies gluttony, giddinesses of the Head have arisen in the morning, they had rather to have the matter of Diseases to be conveyed into the Brain, in a right line, out of the stomach, in the likeness of vapours, through unnamed Trunks, and the throat: And so, black Choler, according to Hippocrates, to be brought sometimes into the body of the Brain, and to bring forth the falling-Evil; or else into the Soul it self, and then to cause the passion of hypochondrial madness: And that by uncertain passages, conveyers, and unto certain scopes or objects. But seeing one onely melancholy humour, should be unfit for so great evils, it was doubted in the Schools afterwards (not indeed in a Quaternary of humours now anciently established) in the malice of humours, as yet not searched out; but undiscerned: For least they should be pressed with the straightness and samelinesses of passages, not satisfying so great a variety, they fled unto fumes and vapours, that the various fumes of one black Choler should pierce into the bosom of the Brain, and stir up diverse cruelties: And they have safely covered these toys from credulous young beginners; they being secure that they were never to be compelled unto a designing and beholding of those fumes. In the mean time, the Schools are worthy of compassion; that in so great a sluggishness of narrowly searching into the truth hitherto, they are compelled unto so miserable straights: but surely, the sick are more worthy of pity, who have suffered such helpers, hired for much money unto the destruction of their life: Because such Patients be more inferiour, and miserable than such Agents.

Therefore the Schools have neglected the matter of so diverse poysons besieging the Head, and life: But they being heedless, have passed over the application of that matter unto the life; to wit, that a disease occasional cause should stir up a disease Agent; and the immediate, and whole mentioning of this History, no lesse than the consideration thereof. Likewise also, they

have therefore dis-esteem'd, the manner of making a Disease, and of deriving the poysonous activity unto the vital object; To wit, because they have been wholly ignorant of the sink from whence those poysons should be derived, and have pass'd it by as a thing altogether unheard of; Because they have neglected the proper action of the Family-government of man; without the knowledge of which, notwithstanding, nothing of those things which do befall us within, can be known: For onely the action of the Agent on the Patient, hath been known in the Schools, the which indeed they would have to be made with a certain circumventing or invasion, with a strife and reacting of the Patient, and with a weakening and re-suffering of the Agent.

29 But there is a certain action far different from the former, whereof Predecessours have never made mention, which I call the Action of Government: which indeed, is not onely made without suspicion of re-acting; but also without a bodily co-touching, and therefore it hath its supposed object at a distance and separated. It is called magnetical and sympathetical, or attractive and co-passionate (being derided by the modern Schools) when it consisteth between objects at a distance in place; but when it is circumscribed in our Body, as a difference from a *Magnetisme* or an attractive virtue, I call it the action of a meer government; wherein the Agent disposeth of his proper patient, or object of his own Sphere, as of an Client of a hereditary right, according to an ordination of Laws inbred in him, subjected by a Symbole or mark of resemblance. Indeed, let the Agent be the Tutor here, and the Patient be in his minority. And there is a co-like action of the Stars in the Universe, as well on each other, as on sublunary bodies: The which, seeing without controversie, it is there influential, yet in sublunary things it hath been undeservedly suspected, and so hitherto barren and neglected.

30 But our present action of government, is not the action which the Schools have acknowledged to be by a consent of parts, or by a conspiracy of offices and necessities: For truly, government doth not require a consent. It is therefore first of all, a deceitful name, and therefore it either contains a mask, or besides, a deceit or juggle, a Fable, that is, it containeth nothing: For in very deed, they will have this consent to be stirred up, required, wrested back, by Fumes, Channels, Conduits, or threddy fibers; which, as they are not in nature, nor are there required; So also, they have nothing common with the action of government: For the Schools do no where admit of the action of an Agent, unless it be applied to the Patient by a mean, in a continued channel, as it were by a Chain. They deny I say, a continuation of virtue, extended by the sameliness of a mean, unless it be brought or conveyed unto its proper suffering object by a certain Trunk: And especially in the Body of man, they decree nothing to be done without a communication of passages: And this hath been that continued, yet ridiculous necessity of revulsions and derivations amongst them.

31 Truly by this inducement, Anatomy hath been garnished for the Body of man, as if it were the undoubted berokener, and healer of all Diseases: For hitherto they have taken so great pains therein, that the Schools having forgotten their own *Galen*, do measure him to be a true Physician, who shall point out most in the filths of dead Carcasses, and who shall certainly finde by his own knife, those things which are published by Predecessors in this respect, even unto superstition: And the error of so superfluous a curiosity, and pride of unsound Doctrine, prayled by the ignorance of the Schools, is to be judged to have been brought in by the spirits of giddiness, and the Authour of dark dimness: for unto whom it is acceptable, under what Title soever, we loose our time unfruitfully.

32 For it was sufficient for Anatomy, to have known the situation, co-knitting, and uses of the parts; but not to have exercised a butchery on dead Carcasses all ones life-time, to finde out the passages or conduits of the least vein: For truly they have regard unto a vain and sordid boasting, wherein the most pretious race of our life is unfruitfully consumed.

33 For in truth, the knowing and Philosophical preparation of Simples, require almost the whole life of the whole man to themselves:

34 For indeed, seeing one muscle ought to be moved, another being in the mean time, quiet, the chief Judge or Arbitrator of things hath appointed interchangeable courses of Organs, so that the command of our will should be declared in the muscles by deputed sinews onely, but that by the muscles and bones it should be put in execution: From hence the Schools have thought, that therefore all our actions are made by nothing but a co-chained thred of Organs or Instruments, through the far-of sequestred and divided Families of the members: neither have they heeded, that an Insect, by one onely Liquor extended throughout his length, doth supply the promiscuous offices of Veins, Arteries, Sinews, and Bowels; so as that a Flie, as yet flies away, his Head being cut off; and I have seen the Head of a horned Horner (which they call a flying Srag) which was cut off; to live and be moved six dayes after. Therefore varieties do not depend on a necessity of powers and Organs; but onely, because it hath well pleased the Creator to distinguish some offices, and ends or bounds in the more perfect living Creatures, by a blinde, and mutual dependance of Organs or Instruments. In the mean time, the action of government

vernment doth not cease in man by reason of this dependance, and reciprocal successive course of members; the which I have already accused in an Insect: but not a few offices are administered in the Family-government of the same, without all connexion of deriving Channels: which thing, because it hath stood doubtful, therefore the Schools have assigned the greatest glory of life, and studies unto Anatomy: And when as the bond or conjunction was to them unknown, they therefore with the amazement of the unwonted matter, presently fled unto blinde ascending vapours, or humours prostrating themselves without order, for a sacred Anchor of ignorance: For as much as, after that they had dissected at pleasure, those that were strangled by the womb, those that were cut off by swooning, or those who died by fits of the Falling-sickness, or tremblings of the heart, and had found no destroyet of life in the passages, to whom the guilt of the murder might be imputed, they betook themselves unto blind vapours, and filthy or defiled exhalations derived into the heart, and head: However, they then at leastwise ought to admit those deadly vapours to be carried about on every side, by no continued commerce of passages: I willingly admit of corporeal actions, whereby heat doth afterwards make that hot which is brought unto it, also of a passage whereby belching doth ascend out of the stomach thorow the Weasand into the throat and nostrils: in the next place, that excrements do cover their own Conduits, and from which, that which is grievous is exorbitant, or stumbleth: also that the vital Spirits are ordinarily dispersed into the Body by the vassally Channels or Pipes of their own Bowels: I may be accounted out of my wits, unless I confess these things. Again, I admit of an action, whereby the Ferments of the Bowels do issue into the Kitchins of the digestions, as it were by certain beames, nor are they carried by an oblique or crooked motion:

But I do not passe by a third action in mans Body, which is called *Influential*, or that of government: The which although it cannot ordinarily wander without the Body; yet it is abstracted from a co-binding mean: For neither doth it act by a direct and Sun-like beam onely; but also by another, to wit, by that which doth unsensibly pierce the whole juncture of the parts, and in manner of the Moon, whatsoever it also obliquely behoideth, that it affecteth or moveth, even as already before, in our new Meteors. This is I say, the action of government or of dependance, shining or beaming, and piercing every way, without the bawdery of co-binding, or conjoyning; yet not but unto a proper object. Note here, that I have elsewhere said that the Beard is generated by the stones, in a man, whom they distinguish from a gelded person. But besides this action of government, I acknowledge moreover two natural ones, but prodigious or monstrous ones: Therefore there is a third action, proper to incorporeal Spirits, which for action, do not require a direct beam, nor a beholding of the object, nor a nearness, disposition or co-binding of the same; but they act, onely by a powerful beck (for indeed they want extremities or outmost parts, whereby they may touch as well the Bodies which they pretend to move, as also the meanes themselves, whereby they may move Bodies) with a far more efficacious influential force or virtue: That action is nigh akin to that whereby the Soul doth signifie its will or beck unto its own Organs whereunto it is tied: For thou hast made him (O Lord) a little lesse than the Angels, by the obligatory bond of a Body: otherwise he is more worthy, whom thou more esteemeest of, who art not deceived in thy estimation: Thou wert incarnate for the redemption of men, not for the redemption of Angels.

There is also a certain lying action, usual with wicked Spirits; to wit, a juggling and bewitching one. The which, although it contain in it a true action; yet it doth not manifest a true effect: But the bewitcher befools the sight, while the same things appear to one, which are not, or which are not to another, or not in the same manner: He befools the eyes, that he may represent false things unto them, and mock them with his beck or at his pleasure: It is almost just as in Fevers, doatages are naturally objected, which are not before the eyes, and oft-times also without doatage, a feverish matter seemeth to be brought thorow the back-bone, unto the places affected: For they are impostures, the participation of a blemish, the dispersing of a strange tincture, from a contagion of the inflowing Spirit; but not a puffie dispersing of corporeal vapours. That is government, whereby one part obeyeth another: In the joynt-sickness or Gout, that doth clearly appear: Because a certain indisposition of the stomach, with a small Fever, goes before, before that any sign doth manifestly appear in the joynts: So in swooning, sudden death, the Falling-sickness, giddiness of the Head, Apoplexie, &c. the part is played about the mouth of the stomach; so that for this cause it hath deserved the name of the heart; and stomach-remedies being suddenly offered, they are for the most part restored: And so like juggles, they are made elsewhere, and seem to be carried to some other place: For whatsoever is written concerning vapours lifted up out of the stomach, and womb, they do spread forth bewitching darkness, as well about the matter, conveyances of passages, and meanes, as the government of life it self. After another manner, there are true actions, and true effects; Even as elsewhere I have distinguished in the Treatise of Catarrhs or Rheumes. I must now more deeply inquire

enquire into the Paradox of the action of government: For indeed, in the first place it is commonly, well observed, that anger, fear, and other passions of the minde, do not onely with speed diversly affect the Spirit carried in the Arteries and Sinews with the very stroak of the eye, that the Cheeks do fall, the Appetite periseth, the hairs stand upright, the voyce sticks, the Spittle foams, sweats and the other excrements themselves do defile, through the storm of disturbances:

41 But a Horse-beast affords the fragments of his hoof, which being fried, and taken, cures the Bloody-flux: but if the Beast be a wanton Colt; then his hoof is mortal to those that have the Bloody-flux. The spittle of a Dog cures wounds by licking them; but if he be corrupted with madness, he propagates the deadly poyson of his own madness on other Species, yea on general kindes: we have Household examples:

42 Eunuchs are beardless, of a straighter neck, their knees being writhed inwards, &c. Therefore the Beard at least doth efficiently depend on the stones being come to maturity; yea the whole habit of the Body, and inclinations of the Soul in gelded persons, do differ from entire individuals: which thing is evident and daily seen in an Oxe, a Bull, a Capon, and a Cock: But yet the stones have not their Pipes, Fibers, Guards, or Vapours on the skin of the Chin, on the feathers of a Cock, or on the horns of a Bull, as neither on the animosity or sturdiness of the minde, or on the haire: But there is an unsensible influx of the stones, as it were another of the Moon, beginning even from an Infant, before the ripeness of age, also at the time of ripe years, changing the voyce: Therefore the action of government of the stones is no otherwise than as the Moon begetteth the Marrows with child: So the Brain is the chief over growth, which the straining of the turning joynts in crook-backed folks, or putting bones out of joynt, do sufficiently shew: Which thing also in the womb doth not sluggishly offer it self: by reason of the

43 womb alone, a Woman is that which she is; she wants a beard; and although she be of a moyster habit of Body, yet she growes sooner to a perfect state: She suffers other disturbances and animosities, and makes another flesh and blood, diverse from a man: And so that also, for the wombs sake, the Sex assumes a devotion to it self, by a certain Prerogative: The ruler of these actions sits in the womb, who being sore smitten or disturbed in his own Circle, is for the producing of all Diseases universally: And therefore the Jaundise, Apoplexie, Strangling, Asthma, &c. are not from things retained; But they draw their original from a more sublime Monarchy: For oft-times, the womb straineth one onely tendon in the foot, or throat, or it plainly presseth together the whole Weasand, as if the disease were local; when as in the mean time, no exhalation is sent, directed, or received unto that sinew or place: For by an Aspect onely, it contracts the Lungs, that it may wholly deprive them of breathing. They are trifles, which are brought hither concerning a hurtful vapour: Because it is that which should more neighbouringly pull the Intestines, Stomach, and Midriff together, than that it should come unto the Lungs onely. Elsewhere also, the Throat ariseth unto the heighth of the Chin, and ferleth again; neither is that the reward of vapours: But the dominion, government, aspect, and influx, and command of the womb causeth it so to be: For it affecteth that part which it will, and sometimes destroyes the whole Body because it is subjected: For as long as it is not shaken by the disturbances of the Soul, it stands with a straight foot; yea the womb sleepeth or slumbereth; but being once enforced by disturbances, for the future it brings forth its own inundations

44 throughout the whole Body, and now and then, those durable till death: Because if the womb by its own Monarchy, wholly distinguisheth a Woman from a man, and it be the promiscuous parent of that distinction, it is no wonder also, that it doth by the same government, disquiet all, even the most remote parts, no otherwise than as the nearest, when, or where it will. And it is

45 certain to him that makes a full search, that the operations of the sensitive Soul are of a co-like order; and of co-like progresse in operating, that if the womb by a spiritual government smites the health, this is indulged to the Soul, by a like priviledge of acting on the womb: For if a Woman great with Child, being stirred with a desire (as elsewhere I have repeated) doth behold a Cherry, and shall touch her self on the fore-head; the Young presently receives the Cherry: Not indeed the naked spot of a Cherry; but a Cherry which waxeth green, white, yellow, and looks of a ruddy colour every year, together with the fruits of the Trees: yea which is far more wonderful: For that which happens to the Young in *Brabant*, that happens far sooner to the same in *Spain*, to wit, where Cherries do sooner come forth: Therefore the thought or cogitation reacheth the Young in a direct passage: not indeed by the directions of fibers, or straight beams, and the conveyance of aptness of readiness, as neither by the conceit of the Brain and Womb; but onely by a reciprocal or recourfary action of government. But besides, if there be no Young present, the Ideas of Imagination do not therefore cease to be deciphered in the sides of the womb: The which, seeing they are strangers to the womb, it becomes easily furious, as being impatient of foreign Tables. There is therefore a passable way from the sensitive Soul, into the womb, and from this to it: which thing, *Hippocrates* first took notice

rice of; To wit, that the whole Body was expirable, and conspirable: From whence it comes to passe, that some Symptomes of the womb, are scarce discerned from enchantments: For it so straightly strains the Coat of the Lungs, that it sends no Air at all thorow it into the breast: Here is no communication, passage, access, scope, or manner of a vapour, and much lesse is there an affinity with Rheums in this respect, seeing it begins and is bounded or finished without a material aflux, or eflux. It is therefore onely the action of government, whereby the mad womb doth disturb all things: But a co-knitting, nighness, aprnets, or consent are not to be regarded; but a superiority of Monarchal power, and a vital dependance of parts: For the ruling parts do act by an absolute power (not being bound to the nearness or nice scituations of places) in every scituation of the Body, alike cruelly: And that which is far more famous, the ruling power or virtue, reacheth undefiled, unto its bound or mark without a defilement of meanes: The womb doth oft-times live, and tumulteth after the death of a Woman, which it hath brought on her: And so it enjoyes a singular Monarchy, which that duplicity declareth; neither doth it obey the Body, unto which then it prescribeth Lawes: For neither otherwise, is it violently shaken but by the disturbances of the Soul: wherefore, besides the singular perceivances of smelling, tasting, and touching, it is powerful also in a certain brutal understanding, whence it is mad and rageth, if all things shall not answer its own will or desires: It rageth I say, by writhing it self upwards, downwards, before, behinde, or on the sides, with an undeclarable torment of pain: But as long as that fury is restrained in its own Inn, it indeed stirs up local griefs: For the parts which it forcibly snatcheth, or beholdeth at a distance, it doth as it were strain and strangle with a Cramp, no otherwise than as being stirred with fury on them. I remember, that I once saw those that were strangled by their womb, whose dead Carcasses looked black and blew, being black in those parts wherein they had been pained before death: Neither also doth it largely poure forth its Issues, unless it should open its own Veins by an inordinate madness, to overthrow the guiltless treasure of life: So neither doth it contract the sinewes and muscles, make the joynts lame, displace the tendons, resolve the muscles, and crisp and wrinkle the coats or membranes, but onely by the action of government, and unless it being stirred with fury, it should keep a duality with the Womans life; otherwise, as long as every thing keeps unity, it desires to remain in its Essence or Being. When therefore a fury acts out of the womb alone, it is the lesse evil: But when it flies thorow into the sensitive Soul (with which I have shewen that it hath an agreeing co-resemblance) it pours forth the true madness of its own fury out of the hypochondrial part. In young Maids at their first being enflamed or swollen with a lesse pleasure, it withholds, suppresseth, discoloureth their courses, and brings forth inordinate ones: Then at length, it produceth Palsies, Cramps, beatings of the heart, tremblings, and swoonings, and contracteth the sinews: which distempers, by the volatile tincture of Coral, Oyl of Amber, Salt of Steel, and such like Medicines, I daily cure. The same distempers being of the milder sort, do obey stupefactive things. Also, the more cruel ones, require greater Secrets of Chymistry. What things I have already spoken touching the government of the Stones, and Womb, I have demonstrated by many Arguments, in the Treatise of Catarrhs, and likewise of the Duumvirate, not by a more dull privilege to belong unto the Stomach, neither that fumes, as neither that vapours do ascend out of the Stomach unto the Head; and so that in this respect, an impossible Fable is taught in the Schools. Likewise in the Treatise of Fevers, and elsewhere, I have shewen, by what fume drunkenness is made, and by what way, fumes are derived into the more formerly bosoms of the Brain. Now I will teach the manner of making in an Apoplexie, the Falling-sickness, drowsie Evil, &c. that when I shall have denied them to be made by a co-knit Chain of vapours, they may at least be understood to undergoe the action of Government.

To which end I must repeat what I before spake by the way; To wit, that the Beard is bred by the stones, and that the distinctions, ages, varieties, and colours hereof do depend thereupon: which thing, seeing it is commonly known, I at leastwise admonish, that it ought to be understood, that a Vapour is not made, which is brought forward by the Ministry of particular Organs; but that a power is to be considered, which in manner of light, doth affect and dispose the whole Body, or at leastwise its own objects, according to the gift, and ends feminally implanted in them by the Creator: therefore a certain power or virtue beames forth from the Stones throughout the Body, into the Archeus, and so also, into the sensitive Soul; seeing the Church commends the femall Sex for a natural devotion. Why therefore doth the Beard grow on the Chin, and not on the Fore-head, or on some other place? seeing that efflux of the light of the Stones throughout the whole Body is universal? This matter carries in it a most hidden Root of Philosophy, demonstrated in the Treatise of the entrance of death into man: For we must know, that Souls do act on their own Body by the power of their own certain vital light, the which, seeing it is by the life (in which the Soul it self is every where present) every way extended, the Soul in that its light, deciphers the Idea's of its own concept and command, that afterwards, it may by the administering Spirits be wholly committed into the Organs, for execution: But those soulified lights, or lightsome Souls themselves, cannot be comprehended by us by a direct concept; Seeing they are as it were, the immediate clients of another, and that an intelligible World: wherefore the most High calls himself the Father of Lights: For the Senses do bring nothing unto us from without, w^{ch} may decipher a conception of the soul in the phantase: wherefore in the Treatise of forms, I have according to my slenderesse, touched at this matter as largely as I could, in the newness of so great a Paradox, which is as yet more strongly to be considered elsewhere: therefore lest repetition should tire, it is sufficient here, to have said by the way, that substantial Souls and Forms, even as likewise also, a formal substance (which I elsewhere distinguish from the former) are certain unnamed Lights, immediately framed by the Father of Lights. Therefore the powers depending on Souls, and certain ministring guarding Lights, are also, thus far lightsome. I have shewen therefore by Science Mathematicall, that those very Lights do pierce each other,

other, yet that they reserve the Essence and properties of their former Lights: But in inferior things, where in Forms do inhabite, and also formal Powers, that these have their light even actually capable of being stirred up by our Archeus, no otherwise than as in an Egg, the power of the seed is actuated by a nourishing warmth. Therefore there is in the roots of the hairs, in the chin, a power of growth, duration, and other dispositions, although the masculine ruling power thereof, be of one stone: which power of the stones indeed, although it be absolute, yet it is not but diversly received in places, to wit, according to the manner and capacity of every receiver. But as much as this speculation conduceth unto Medicine, I will translate poysonous powers into the place of vital ones; Because they are not lesse lightsome than those which are otherwise, wholsom, if poysons do immediately issue from their own forms: For they are the gifts, either of the more outward or forreign Simples of the first Creation, or in the next place, are begotten afterwards in us through error of living. By the same priviledge also, the natural powers of the parts, to wit, of the Womb, Stomach, Stones, &c.) do beam forth their own lights throughout the whole Body, and do pierce the light of the Archeus, also by the action of government depending on their light: whence indeed, this Archeus is comforted, weakened, estranged, prostrated, yea perisheth: Therefore poysons in the Midriff, or those bred elsewhere, do act by virtue of their own formal and lightsom powers, according to the natural endowed Idea imprinted on them, and they do affect the vital light planted in the sensitive Soul, in the Archeus, and so in the parts, and they mutually pierce each other by a radical union, and that either by a contagion of poyson remaining, and transplanting the in-bred, formal and vital light of the parts; or onely for a little space, as in those that have the Falling-sickness, with a liberty of returning or not, according to the requirance of their root: Therefore the Head is not onely chief over the lower Organs, but also these are likewise chief over the Head, the which I have elsewhere declared in a manifest example by hanging: For truly, the thorny marrow being encompassed in the middle of the turning Joynts, cannot be strained by the Rope, that it should deny the passage of breathing to the Spirit the mover; nevertheless, the understanding, sense, and memory, perish at the same instant, by reason of the stopping or shutting up of the Arteries of the throat, even before an every way stopping of Air: whence it is sufficiently manifest, that some intellectual light doth continually spring from the lower parts unto the Head, by the intercepting whereof, presently hanging, and drowning (although the Brain, thorny marrow, and sinews be not hurt) every virtue, power, and light of the Soul doth nevertheless perish: As also in a Feverish doatage raised up from the lower parts, the discourse of Reason perisheth. There is therefore a reciprocal government of the lower parts. I willingly confesse also, that dimnesses, giddinesses of the Head, deafnesses, Apoplexies, Epilepsies, and other evils of that sort, do arise from the lower parts; yet not to be derived by vapours, unto the Head: For if they should ascend by the way of the Throat or Wealand, they should at leastwise afford nothing but a distillatory and unfavoury water. But I have shewen elsewhere, that watery vapours or exhalations cannot be carried so much as to the plain of the brain, and much lesse into the bosoms of the same: Therefore let the fault and guilt of vapours in the aforesaid Diseases be vain. And then, neither are vapours carried out of the Stomach, unto the heart and head, through Arteries and Sinewes encompassing the mouth of the stomach: Seeing the Schools themselves confesse, that it is not the office of the sinewes to draw from forreign parts. Indeed, they will have the Arteries to draw Air for the cooling refreshment of the heart, and the pressing out of smoaks; Neither of which I have shewen to be true: But at leastwise, that hath not place here, in the Arteries ending into the stomach: seeing they do never hope to inspire cold air, likewise that not loaded with a smoakie vapour, out of the stomach, nor out of the bottom of the belly; as neither fresh air, yea, neither in the next place, should it be convenient to expel their smoakie vapours thither, where they should be much more hurtful to the stomach, than being detained in their proper seats: For the mouth of the stomach hath not undeservedly received its name, as to be the mouth of the heart: Because more powerful tokens, signes of life, and more horrible storms of disturbances do arise up out of the stomach, than from any other place: therefore neither was air to be drawn out of the stomach, and much lesse a vapour, the sewel and beginning of so many evils, or smoakinesses, to be expelled into the stomach by the arteries; that is, giddyish, Epyleptical, Apoplectical vapours, &c. are not drawn, neither do they voluntarily ascend thorow the Arteries: For truly, the unutterable Creator hath directed all the aims of things unto the necessities and requirances of uses. Lastly therefore, if the aforesaid Reeds do not draw hurtful and diseasifying vapours, surely much lesse shall the stomach send or expel those, thorow the arteries, or a sinew: Seeing that it could after another manner, most speedily free it self by belching: For neither is the stomach a pair of bellows, that it ought against the will of the Pipes, to derive hurtful vapours conceived for it, into the chest of life. And moreover, the stomach hath but few veins; and it is a strange thing for these to beg any thing out of the stomach (as hath been proved in its own place): wherefore vapours are not carried thorow the veins: For which way should they allure and receive that which is besides the appointment of nature? How should the stomach snuff up its vapours into most strait or narrow vessels which are filled with blood, especially those which are not strong in drawing? For I consider the stomach, not indeed after the manner of Galen, that it is a sack or naked Kettle dedicated to the cooking of meats; but as a vital bowel, which is prevalent in tasting, smells out a thing, and which is driven with divers appetites, as if it were a living Creature: and now and then it so loatheth some things, that a man had rather die, than to swallow one morsel which goes against his stomach. Indeed the stomach is of necessity serviceable to the whole Body, also for the vile Household-service of the Kettle: But thus far other things do diversly obey it, and unless they give serious heed, they are cruelly beaten: According to that saying, *He that will be the greatest among you, let him be the least.* Surely the stomach is diligently busied in a low service; yet the family-service of the stomach is not therefore vile or base, no more than for the High-Priest of the Jewes to have played the Butcher; but being compared with the stomach, he was a certain counterfeit or personage of life, with a famous majesty. If a Sinew, Artery, and Vein are seen implanted in the stomach, indeed they are rather signes of Clientship, and recompences whereby they confesse themselves bowels tied or obliged to the stomach, than that they were added unto it for Government. Mast, and Sails. But neither indeed will I have this Principality to be so conferred on the stomach, as if the Government of that Common-wealth doth wholly belong to that membrane it self: For of the Spleen and Stomach, I make one onely Wedlock, and one Marriage-Bed: Wherein I attribute to the Spleen, the offices of a Husband in the first motions, and to the Stomach, in the first sense or feeling: Therefore the Stomach is the complicating of the Spleen, and the Spleen of the Stomach; under the one only Bride-bed of them both, is the Principality of one *Duumvirate*. Yet I do never cease to contemplate of that which is sufficiently admirable, what the Lord of things hath fore-seen; I say, in the naked coats of the Brain, Womb, Stomach, *Pericardium*, &c. I say in the Membranes; but that, in things which are abject in the sight of men, God hath wont to constitute his wonders: whose name be sanctified for ever.

C H A P. XLIII.

The Duumvirate or Sheriffdome.

1. Sleep is from a Sleepifying or somniferous power, and not from a defect.
2. The Opinion of the Schools concerning Sleep.
3. The Opinion of the Antients is opposed.
4. Contradictions.
5. The thingliness of Opiates.
6. The impossibility is shewn from the Scituation of the Sinews.
7. That Sleep happens, the Opiate remaining within the Stomack.
8. From the effect of Opium.
9. The Sulphur of Vitriol is taught.
10. Some absurdities accompanying the position of the Schools.
11. A ridiculous privy shift.
12. When Dreams are made.
13. Why the Headach ariseth from over-eating or drinking.
14. Paine ariseth from a contraction of the Coats of the Brain, without a Vapour.
15. A Position for the Duumvirate.
16. The Conclusion.

THe Heathen Poet doth morally, yet from a homely judgement, call Sleep, the Image of Frozen Death. But I, seeing that I know Sleep to be a natural power, dismissed from the principality of the Stomack into the Brain, and to be committed to the charge of the Power of Government; that it might be put in execution; being a Christian, do believe that God (alwaies to be sanctified.) When he intended to frame Woman of the rib, he cast a Sleep upon Adam: Not indeed as a privative Being, but as an actual real faculty, and meerly positive: And therefore that the Power of Sleeping is vital, necessary, and consequently natural: For I may not believe, that God made Death in man, or the image thereof: Neither was it meet, that the image of Death should go before sin, and the occasion of Death.

The Schools indeed teach, that Sleep is caused by vapours lifted up out of the Stomack into the Brain, stopping or intercepting the passages of the Senses, Motion, Speech, Judgement, &c. which things surely, I being as yet a young man, judged to be ridiculous: For in very deed, so a disease had been before sin; because sleep should be a disease; to wit, there had been a flatulent and vapoury Palsie, and Temporary madness, both in a body then as yet, not capable of suffering, and in a life immortal. Its a shamefull thing therefore, that the blockishness of Paganisme should as yet be seriously taught in the Schools, especially by Christians, better instructed. Yea the Schools do erre in their own position proposed.

For those that sleep do move, and turn themselves up and down, some do walk about, do feel the stings of a gnat or flie, so as that they do thereby awake: others also do speak, and oft-times aptly answer. At length, as the Schools do badly accord with themselves, while they confound sleep, and waking Catarrhs, with the same root, causes, and manner of making; so I, after that the toys of a Catarrhe were hissed out, rejected, also the assigned causes of sleep, as vain fables. Last of all the Schools also lay hands on themselves, while they teach, that from Opiates, things (as they say) most cold, and rather things powerfully restraining every evaporation (at least wise they are feigned to restrain, &c. Vapours for Catarrhs, more than Coriander) from their own nature; Sleep, the Drowsie evil; yea and death are most readily brought on a man: and so much the more speedily, by how much the Opiate shall be of a more gradual cold in quality and quantity: And that by how much the more of sincere Opium shall be taken, and the more inward cooling made, by so much the more plentiful, and more continued vapours should be brought from the stomack into the head, also although the mouth of the stomack be shut. But surely it is a stupid devise, that sleep should be made by cold. Neither is it to be understood, how one onely grain of Opium can cause a sufficiency of cold in the Stomack, and had actually driven a sufficient quantity of vapours into the Head? How likewise, it shall belong to cold, to stir up vapours, rather than to re-

strain them. But these things we may suppose to be granted by the rule of falsehood.

6. And that Sleepifying vapours are derived upwards from the meats: also that the Sinews, the authors of the senses and motions, are stopped by these vapours. But I would they had first considered, that the roots or first extremities of the Sinews, are continual to the Brain and thornie marrow: and that the other extremities or outmost ends of the Sinews do end into the more outward muscles, or into the very Organs of the Senses: and so, that therefore sleepe vapours first ought materially to pierce, and plainly to be imbibed into the substance of the brain and thornie marrow, and to obstruct both, before that they should according to the position of the *Schools*, cause sleep. And which way should these vapours incline from the Stomack, and pierce thorow the whole Substance of the Brain, by what meanes should they reach even unto the very innermost, and altogether continued root of the Sinews it self, which is inseparably connexed to the Brain? In the next place, how could he that is awakened at the will of the awakener, be so speedily loosed and freed from those impediments? Or what may detain those vapours there for so many hours, without their co-binding, or co-thickning into water? for truly those vapours being once constrained, a passage should lay open to the Spirits, which should presently shake of the sleep: Or what at length may hinder, that new vapours should not continually make towards the same beginnings of the Sinews, and being there Coagulated, should not bring forth of necessity, daily Catarrhes or rheums; and undoubted palseys? Surely if an Anatomist, or a man in his right mind doth but once at least, rudely contemplate of these things, he ought of necessity to admire with amazement at these fables of heathens, especially because they have no affinity or connexion with the principles of our constitution. It also happens that some one is many times awakened in one only night, that he ariseth, and goes to sleep again; and so almost at his pleasure, there should be so many obstructions of the Sinews in one night, yea in one hour. I passe by in the mean time, that sleep is stirred up, an Opiate being as yet materially within the Stomack; even as involuntary experience hath often taught. Therefore either so small a quantity, and onely the *Odour* of the *Opium*, ought to fume up into the Brain, or it self being there detained, should send away sleepey Vapours its Vicars?
7. But not the first, because before that the *Opium* could strike the sense of Tasting, or Smelling, the *Opium* should be continually percieved in the Tongue, Palate, Nostrills, and Jawes, and that before Sleep, which is not done. Moreover, the Sulphur of Vitriol, which is an exceeding Sleepifier, seeing it is fixed, cannot shake its Vapours into the Head, as neither dismisse from it, its Vicary partakers. Truly I conjecture that the Greek Authors of Sleep, or those that were riotous, when they perceived that themselves being drunk, were given to Sleep, judged that they were to derive all Sleep from no other thing, neither that Sleep could any longer creep on us, (not so much as late in the Morning, and the Meats being now digested) but only from Meat and Drink. I find also in the *Schools*, the material causes of Giddiness of the Head, not a whit to differ from the causes of natural Sleep: All which things, I have elsewhere concerning Rheums, proved to be meer ignorances, and unfavoury consents, having arisen from a sluggishness of diligent searching, and a readines of subcribing. But I pray, what is that which is so cold in *Opium*, which causeth Sleep against my will, and I being sufficiently heated: If the coldness of vapours, why do Wines after Dinner provoke Sleep? Is there therefore one only identity or samelines of disposition of that which is cold, and hot, to procure Sleep? Why therefore is cold singularly adjudged to *Opium*? Why are not hot things judged to be like Stupefactive and Dormitive or Sleepifying? Why have not deadly Poppies much praised by Poets for Sleep, perswaded them to remember another vertue besides cold? Why doth *Opium* taste bitter? And why is bitterness reckoned in the *Schools*, to be heat predominant? Therefore the *Schools* must needs chuse one of these two; To wit, either that cold in *Opium* is not exceeding, and by consequence, that *Opium* doth not cause Sleep through cold; or that bitterness is a deceitfull token of heat in the *Schools*. For why is not *Purslain* which is cold by reason of its third degree, Sleepifying? Why is not a handful of *Purslain* equivalent to two Grains of *Opium*, seeing there is more plentiful cold in it, and it doth more powerfully coole in such a small parcell, than in so exceeding small a quantity of *Opium*? Why doth *Nightshade* make one mad, but doth not by its cold produce Sleep? But I do find in *Opium* a sharp Sudoriferous or sweat provoking Salt, and

and a bitter oyl, far differing from the smell of *Opium*, yet provoking Sleep.

But the *Sulphur* of *Vitriol* is sweet like hony, with the smell, vapour, and fury of *Opium*: because it being fixed in the torture of the fire, is exceeding hot, and Sleepifying. For there are some, who do wash off a powder from *Colcosar* or *Calcined Vitriol*, in depriving it of its saltness: But it is almost unefficacious, how ever the writers of young beginnings by vain promises may boast of it: For the right, and that which they call, that of the *Philosophers*, is made of the Spirit of Green *Vitriol*; which by a repeated Cohobating or injection of its own extracted liquor in distillation, being pressed out and made notably volatile in the last torture of the fire, is coagulated and fixed: which thing the common *Sal Armoniack* performeth, which ought afterwards to be taken from thence by the repeated distillations of the Spirit of wine. That *Sulphur* is commendable among Secrets for long life, and for chasing away a troop of some diseases.

Sleep therefore possesseth many as yet speaking, after the whispering of three moments. How therefore shall a stopping up of all the Sinews be in these, so suddenly at hand? Wherefore in the next place, doth Sleep sooner creep on those that lay along, than on those which sit, when as otherwise, the motion of Vapours from the lower Parts, ought to be far more easie in a body raised upright, than in one laying sideways? Moreover, although it should be granted, that all the Sinews are equally stopped up, and that before sleep (which is as unfavoury as ridiculous) yet from whence are the mental powers stupified by Sleep? Unless thou hast given the Soul a charge of necessity to have placed her Inn in the Chest of the Brain, and nigh the Sinews? And thereupon the Bosomes of the Brain, all the interval of Sleep to be filled, not indeed with Animal Spirit; but with forraign, crude, grosse, and disease vapours, and the Authors of discourses themselves, the while, to keep holiday, sleep, or to wander far abroad? But all the Organs to be straightway after set at liberty, at the sound, or pleasure of the awakener?

But I have heard Sleep to be excused by the Title of an Ordinary Effect, and the which should otherwise be disease, unless it were daily and accustomed. I have laughed at that old wives invention; That even the first Sleep, or punishment of sin, should be sent into man before excess of Riot. And then, because an evil, which in it self is a disease or an evil, is never the less an evil, because it is ordinary: And that being granted, Sleep should never bring refreshment to languishing strength, but a perpetual pain or labour. But I, after that I once saw or perceived the light of a certain Soul, by some kind of representation, understood that Sleep is made while the Spleen doth properly labour about, or apply it self to nourishment with recreation and delight: Then indeed it giving a leave unto its own serious imaginations, by delighting, it wholly sinks it self into a full rest of enjoyment, to wit, from a perceived sweetness of its own fullness; and the liberty of a stomatichal ferment being restored unto it, it employeth it self in a thorow enjoyment of delights: and therefore also the digestion in the Stomack is more unsuccessful in time of Sleep, because then slower: wherefore enjoyment, and cessation from labour, hath alwaies been the first or chief wish in the whole sensitive nature: vain therefore and full of mockery are the Cogitations in ones first Sleep, while the phantasie of the Spleen or Stomack is with drawn from thinking, from a growing necessity: which things shall presently be more clearly manifested in this treatise.

A *Humorist* being asked by a riotous Person, why his Head aketh in the morning on the left-side above his forehead, perhaps unto the largeness of a greater dollar? He readily answerd, that it was manifest by *Anatomy*, that the *Orifice* of the Stomack was inclined toward the left-side: that it was also taught now for many ages, that painfull Vapours are carried out of the Stomack into the Head; but that they cause pain, because they being left of the wine, are sharp, tart, & biting; & likewise that they keep the perpendicular line of the same side, neither that they are suffered to be extravagant. The which being said, the *Galenist* lifts up his Eyelids, jogs or cocks his Cap, and gratifies his own Soul, because the other being credulous, thinks he had given him Satisfaction by so lying a Fable: For in that the pain of the fore-head obtaineth a straightness of the side from the Stomack, it secretly implyeth some remarkable thing for the action of Government, and the *Duumvirate*: But none hath thought that that can be done without an actuall commerce of vapours. For first of all, no Vapour out of the Stomack, strikes the Head; as neither also is there any sharp, salt, bitter,

bitter, or brackish vapour; even as elsewhere concerning Rheums: Because the pain of which we now speak, is continual, as well to him that lyes along, as to him that stands, or sits, and that without a necessity of belching: But if this doth sometimes accompany it, yet the pain doth never, the less, or more molest: neither also is there therefore, any sharpness, saltness, bitterness of vapours, unless that in inordinate appetite the belching be sour & then especially, there is scarce a pain ever present in the Head. And Moreover, a Vapour being supposed according to the *Schools*, the Weasand at leastwise, holds every where the middle of the Neck and Jaws. For that cause therefore, the Vapours, if there were any, should strike the middle, bottom or root of the Brain with a straight line; but not the forehead, and much less the left-side thereof: neither could they ascend in one that lays down, but should be blown out though the Mouth and Nostrils: Because although they were granted to ascend even into the plain (which there is none) beneath the Brain, yet they should not pierce unto its bowels, without a mortall confusion of the Spirits: And least of all, should Vapours reach incessantly unto the coats of the Brain; whereof notwithstanding, a painful feeling is judged to be, but not of the Brain it self: Yea a pain and favour of the smitting Vapour, should presently be felt, rather above the Palate (where the plain of the Brain is falsely supposed to be) than in the forehead, or under the Scull: Which thing notwithstanding, as many as ever have undergon these pains, will reprove of falsehood.

34 The *Schools* indeed have been ignorant, that the action of Government doth contract the coats of the Brain without vapours, in what part it hath pleased the Duumvirate of the Soul (as in the Book of the Disease of the Stone, in the Chapter of the act of feeling): therefore should not the top of the Crown, rather pain a man, than the one side of the forehead? even as in the *Megrim*? For the Crown is perpendicular to the Throat; from whence it is clearly manifest, that the Head is no more pierced by watery vapours from the Stomack, than the Chin by vapours of the Stones, in Bearded persons, but not in those that are Gelded. In the next place, the bottom of the Brain should especially be pained, the which the vapour should first touch at, and not the coats or membranes of the Brain. And then, the back-running Sinews of the Palate, Tongue, &c. should be cruelly affected, before the left wing of the Forehead under the Scull. Neither at length, should those vapours enclose themselves under the Pericranium, or above either of the membranes of the Brain in the circle of one Doller: Neither also should they ever cause a *Megrim* for one half of the Head, and much less, sometimes for the right side; but rather they should ascend in a straight line, and likewise, should alwaies, out of the Throat, equally affect the whole Head; seeing passages are wanting, which may as it were through Trunks, convey those vapours, sometimes hither, sometimes thither: for why, according to *Hippocrates*, doth milk bring the head-ach to him that is Feverish, if the vapours of whey ought rather to assuage these griefs? Why doth new food appease the head-ach, seeing that from new meat (especially Wine accompanying it) sharp vapours, rather than mild ones, like Milk, ought to exhale? Therefore the pain being once now settled, food should not appease the pain, but rather should stir it up, and make a new one. All which things, seeing they resist the position, and experience, they convince also, that the aforesaid pain, doth without vapours proceed from the Duumvirate, by a naked action of Government. I have many times admired, that it was alwaies subscribed, by all altogether, and throughout all particulars unto the traditional fables of the Antients. But I have shewn in the Treatise of the Toyes of a *Catarrhe*, that these races of vapours out of the Stomack, are trifflous, and therefore also the causes of vapours dedicated to Sleep. Lastly, I have already proved above, that there is an action of Government on the superiour or upper parts, no less than the actions of the superiour parts have been hitherto thought to be, on the inferiour or lower ones. Then also, I have shewn by the way, that out of the Midriffs doth issue the most powerful temper or constitutive temperature of acting in Diseases, which Antiquity hath hitherto dedicated only to the Head.

35 Now I lay it down for a position, that the Duumvirate the president of the action of Government, doth inhabite in the Hypochondriacal part, to wit, in the Spleen, and the Stomach: in parts I say, which the *Schools* have esteemed the sink of the very worst Humor, and the Sack of the more impure meats. Four things therefore in so great a Paradox come to be proved; to wit,

That

That the Duumvirate commands the whole Body.

That the Phantasie or imagination, *Venus*, &c. is to be attributed to, or belongs to the Spleen and Stomack,

That unto this very Duumvirate, belongs Sleep, watching, &c.

That in the same place, is the Inn or Seat of the Soul.

Which four particulars do meet as it were in one only point. The *Phylosophers*, together with *Astrologers*, have dedicated the Spleen to *Saturn*, the parent of the Starry gods, as to the inchoative or original principle of Life: But the *Galenists*, who are wont in most things to contradict themselves, have made the Spleen partly the Sink of the most stubborn Excrementous and feigned black Choler, and partly the receptacle of madness, not indeed by reason of a Melancholy matter in it, but rather, by reason of a certain conceptual, irrational and bestial disturbance; therefore they sometimes name it the Hypochondriacal passion. But seeing according to their maxime, *There is a sound function of the same part, and power, whereas there is a vitiated one, and on the contrary*: I will conclude from thence, even against the will of the Schools, that a certain sound and entire imagination is due to the Spleen, if vitiated, and precordial or Midriffie Melancholy doth proceed from thence: for many do understand that they are mad, and as it were ignorant Idiots, and they grieve that they cannot bridle those phantasies which are importunate night and day: And so, they are vexed at it were with a double mental conceit. For so those whom a mad Dog hath bitten, and are flidden into the fear of waters, (which Disease they have therefore called an *Hydrophobia*) do accuse their involuntary madness, which they forefeel, foretell, and do warn the standers by to beware of them. They answer, that that happens, not indeed because any imagining power is there entertained, but because a fume of black Choler is from thence carried up into the Head, the Sheath of the imaginative power. Which particulars surely, seeing they are of great moment, it is meet they should be examined in a peculiar Treatise of the Soul, and of the Seat, Throne, and Inn thereof.

CHAP. XLIII.

A Treatise of the Soul:

1. *The Treatise of the Soul is Commended.*
2. *What hath diverted Schollers from this Meditation.*
3. *The knowledge of the Soul is not to be delivered for a Conclusion.*
4. *The suppositionary difficulties of the Schools.*
5. *Why the knowledge of things is to be put after.*
6. *By an example fetched from Water.*
7. *The actions of the mind in the Body.*
8. *What hath deceived Predecessours.*
9. *The Author hath desisted from his enterprize.*
10. *Considerable things concerning the mind.*

Seeing therefore, the entire command of the Duumvirate doth flourish or bear sway from the vital Soul; truly the three aforesaid positions may be abundantly proved by the fourth: for if so be it may appear, that the very Seat of the Soul is in the Duumvirate; The principality also of this over the other Members, and Stations of the Bowels, will come to hand: wherefore I will here by the way, treat of the Soul, although by other writers before me, the Treatise of the Soul hath been banished out of natural Phylosophy, especially in order to the knowledge of the *Theory* or speculative part of healing. And although so many sharp discourses of madnesses, do on every side molest us; Yet verily, seeing I have perceived no aid from Predecessours, but labour and grief have pierced my most inward parts, before that I could lay aside those things which I had drawn from Heathenisme; Therefore I have altogether judged my self not to be tyed up unto their Method, in whose possession I have not yet found any thing which may or ought to be snatched into the Beginnings and properties of nature.

By

- 1 By looking therefore into my own Liberty, I considered, that among knowable things, nothing is alike noble, as is the knowing of the Soul it self; from which, as all other knowledge doth obtain its brightness; So also all terms their own distinct bound: for whosoever he be that is un-apt at the beginning, to comprehend the motions, exercises, effects, and thingliness or essence of the immortal mind, shall also be unfit to understand the secrets of nature, which are more remote from the mind than it self is from it self, and therefore he shall scarce be able to proceed unto those things which he shall behold to be the more fit for him. But he that shall first draw forth the essayes of the Soul, and afterwards drink down the jayces of nature, in his return he shall be of a larger capacity than he was in his former reading by the way or besides the purpose. Yet lest I may seem like a lawless Body, to have wrested my pen into the mind, before the explaining of Diseases, I will declare what things have moved me hereunto. For first of all (even for the consideration of nature) I meditated that the mind is the top of humane nature, and the perfection of constituted humanity, and that therefore it was more meet for him to know his Soul, that is, his own self by his Soul, than to enquire by a harmony of corporeal properties, and from a notion of these, to be willing to know the mind it self: for truly, it hath seemed to me, that the Soul being once, even but slenderly known, other inferior things, and those that are placed under our feet, may be added unto us: And that they may be comprehended as it were by no trouble, at leastwise, by a sober labour, which before, at every step, did stir up suspicions, or moove despair concerning that which was true, lawful, like, just, proportioned, the Agent, suffering, priority, that which is appropriated, change, or interchangeable course, or which at length did through too much consent, lead their own followers, their eyes being shut, into fallacy or deceit: whence they were affrighted from the labour of diligent searching, not so much through sluggishness, as through fear of a suspended or stopped progress, and therefore they locked up the bar of the Gate of knowledge as to further things: for it is a clear and undoubted thing, that man cannot know himself, unless he shall first exhaust the knowledge of his Soul. Therefore also the very knowing of the Soul it self, as it Seals the fear of God in the Soul; So also it brings the beginning of Wisdom. If therefore the beginning of Wisdom be awakened by the knowing of the Soul, there is not any kind of Doctrine of the Soul to be delivered for a conclusion of natural Philosophy, according to the custom observed in times past: For it is false, that the knowing of frail things doth make the understanding of our minde ease unto us: But rather, those that are experienced, do know, that the knowledge of the mind, although it shall far depart from a conceiving of sublunary Bodies, yet that it extolleth or lifts up it self, as oft as it shall apply it self unto any humane Sciences or Arts: for he which but once, and by the way only, hath had experience of a turning inward, or Extasie of his Soul, hath known afterwards, unto what things he shall apply his Soul with desire; not on the contrary: Because, although any one hath obtained a knowledge of many things, yet he shall not therefore be fit for the interversions or turnings in of his mind. Therefore by the leave of all before me, I say, and do meditate, that it is plainly necessary, that a Man do first know himself, and afterwards learn the fear of the Lord, which will raise him up unto the true Wisdom, whereunto the knowledge of mortal or frail things, and the defects of these, shall be added as a consequent to the premises, or as an adjacent unto the principal thing.
- 4 Our predecessours, after the essences of things, have then chiefly looked back unto the Soul after a rash manner, and that for two reasons especially.

The first whereof is, because the knowing of the Soul hath seemed unto them far more difficult than that of any other things whatsoever.

The second is, because the knowledge of the mind, might be hoped for, and had, from a diligent search of external things, and an examining of corporeal properties. But although the first of these is true, yet the second can in no wise be so, for if the knowledge of the mind be of an abstracted and spiritual Being, it likewise cannot be derived on us by any speculation of corporeal things.

Because God alone is the immediate workman, and prince of the mind, and the very life of life. Therefore the knowing of our selves cannot be hoped for from any other thing than from its Fountain and Governour: For truly the knowing of abstracted Spirits, differs in the whole Heaven, from the speculation of frail things, seeing they

they do not partake in any common co-resemblance of Principles, or properties. Therefore the thingliness or essence of Bodies containeth not a whit of Knowledge or Light, that the Soul may know or acknowledge, or behold it self, but only by a renouncing, which is a certain despairing and banishment of knowledge, whence also it gets no light unto it self from that which is above, or from that which is contrary to it self, nor also doth it strike a light of understanding for it self, as it were out of a Steel and Flint: Because the manner of knowing the Soul is to be begged from the Father of Lights, and not from else-where: Because it was the good pleasure of the Divine will, that Man should not fetch the knowledge of himself from any other thing, than from the Beginning and Fountain, himself, who is the Beginning Mean, End, Scope, and highest vertical point of all *Phylosophy*, unto which all knowledge is to be as an addition. But further, the essential knowledges (and those from a former thing or cause) of Sublunary things, are quite as darksome, covered, and difficult, as is the very conceiving of the immortal mind, if the essences of things from a former thing, & their causes, be known only to God. Therefore it is simply false, that the knowing of the mind is more difficult, than the naked knowing of things, or therefore to be put after them: Because all things are alike unknown to us, because the essence of all Beings whatsoever, is their precise Truth, shut up to us-ward, and laying open unto that which is infinite. Therefore the knowledge of things is to be measured at the balance; all corporeal things are primarily strangers, and foreigners to our mind, and therefore more remote from the mind, than the mind from it self.

And moreover, other things, are not to be known but by the mind, and first in the mind: for therefore the knowledge of any things whatsoever, is only a certain observation, from whence we frame discourses according to every ones capacity. Wherefore also, every such observation, and discourse fetched from hence, how polished soever, is only from a latter thing or the effect, & far less illustrated than is the observation which is had from the mind. For who ever of mortals, knew what the water may be? The which notwithstanding, is the most obvious, manifest, visible, and transparent of created things: for a Country-man, or Idiot, knows as much of it as a *Phylosopher*: For they do equally conceive of it by the observation of the senses, that it is a Body, weighty, liquid, moist, giving place to ones finger, fluid, and reclosing it self upon the removing of the finger, a receiver of Heat, and extenuable into a vapour; yet none hath known the internal thingliness of the Water, or why it is liquid or moist: even as indeed, we know the circumstances both vital and intellectual: of the mind, and what things do dispose this its own prison unto various alterations, and which do oft-times produce something feminally, out of its concrete or composed Body: So as when the appetite of a Woman with Child doth produce a Cherry on her young, which flourisheth every Year. Also in that we do moreover, know more of the Soul than of the Water, it is that which is known by the *Revelation of Faith*:

To wit, That the mind is a Spiritual substance, also subsisting by it self without a Body, Immortal, Living, made after the Image or likeness of God, immediately by God himself, giving Sense, as also motion to the *Organs*, and the which being separated from the Body, doth perceive without *Organs* at its beck or pleasure, being able also to move out of it self, and the Body being bridled or restrained, is able to produce a Being out of it self (as hath been already shewn concerning a Woman with Child) it understanding, also willing, and remembering, &c.

The Observations of which Properties and Functions, are far more strong than is the knowledge of the Water: otherwise, all things and every of things, by an intrinsic understanding, are equally unknown and unpassable to us.

But that which hath Seduced Predecessours, by thinking that the knowing of the Water was easier than that of the mind, hath proceeded from an Opinion, That a visible thing is of necessity more known than an invisible thing: But they have not distinguished the Knowledge of Observation, from the Internal Knowledge of essence or thingliness, according to which, all things are equally unknown unto us.

They have not known I say, that the knowledge of Observation, doth not introduce an understanding into the essential thingliness of a thing, but erecteth only a thinkative knowledge: For otherwise, the understanding should perceive causes that are before in essence. Then also they have been deceived by the simplicity of the Water, which simpleness they have confounded with the unity of knowledge to us

unknown

unknown. In the mean time seeing the observations of the mind are many, and the more plentiful, the property of every one whereof, denyeth a knowing from a former thing: therefore they have thought that they did undergo more impossibilities in the knowing of the mind, than in that of a simple Body: And so as well the number only in the mind, as a visual frequency of Bodies hath brought forth in them that difficulty: when as notwithstanding, after another manner, in the Beingness of a Being, that which is visible is as well unknown intellectuallly, as that which is invisible. For

6. I intended to deliver an intellectuall Doctrine of the mind, that man might originally, as much as he can, know or acknowledge his own self, and that afterwards he might learn, from the image of the Divinity, to contemplate of things more inferiour than himself.

But when I endeavoured to explain that by the mental acts of Prayer, I had not freedom in that thing: because they were judged to exceed the Square of my own contempt or meanness, I willingly omitted that Treatise.

Let it therefore be sufficient for me, to have plainly demonstrated to others more abounding then my self, that the Christian *Philosophy* of nature, doth not admit of nor will, mortal, strange, far remote things, and the causes whereof are hidden from a former cause, and not to know in the mean time, who I the contemplater may be, what the understanding may be, how an intellectuall act may be formed, and subsist.

10. Especially, because any thing is not conceived, as it is in it self, but after the manner of the receiver; that is, of the conceiver. Therefore before all, the receiving understanding, which affecteth the understanding of things, who, or what, and after what manner it is disposed in the act of comprehension, seemed to me to be weighed. Next, what the sheath of the understanding may be, and the capacity, vigour, and manner thereof. After what manner, in the next place, a power, indeed undistinct from it self, may be drawn, and descend into the Functions and Organs tied and Subjected unto it.

Lastly, before I can know whether a thing it self understood, be true & good, or whether in me, or for me, it is not to be changed in its Beingness by conceiving, or alienated from its own essence, from whence the Truth of Entity or beingness it self had assumed a strange mask. I altogether judged, that those things ought to be cleared up by intellectuall acts, the which I determined could not be more readily, or successfully begged by any other thing, than by practise; that is, from the mental Prayer of Silence. But that thing others shall discern or judge of and weigh more justly or equally, than I: And therefore I would not willingly descend into this labyrinth.

CHAP. XLV.

The Distinction of the mind from the Sensitive Soul.

1. *The Treatise of the Entrance of death into Humane nature, is commended as necessary for obtaining a knowledge of the mind.* 2. *The Reader is also sent back unto the Treatise Touching the Birth of Forms.* 3. *The Immortality of the Mind is proved from the Gospel.* 4. *It prepares a Weapon against the Atheism at this day.* 5. *Leonard Lessius describing or Coppying out, hath re-delivered only out of Augustine concerning the Immortality of the Soul.*

1. **F**irst of all, in the book of long Life, I have demonstrated at large, that the entrance of Death into humane nature, had its own causes in nature, by means forbidden, & without the intent of the thrice Glorious Creatour: & that death being once crept in and admitted, although that was not from the Creators intention, yet that it was afterwards continued, and un-intreatable, from a necessity of nature: and thereupon, not only to have been permitted and consented to by the Creatour, but also that the style of Nature being changed, it was admitted, yea and also as it were commanded, under a better state being introduced, in regenerating through the Divine Grace of Baptisme. In which Treatise, I have demonstrated a necessity of the Sensitive

live Soul, which else under immortality, had been in vain: whence indeed a Law in the Members was introduced, contradicting the Laws of the immortal mind: And a Totall and unexcusable corruption of the whole central nature was received: Which new & unheard of Doctrine to former ages, I presuppose is therefore from thence to be fetched or required, if so be that the knowledge of our Mind be desired: For as it is now thus stranged from its own self & from its own Beginning, because it now seems to hearken unto the commands of the Sensitive Soul, which notwithstanding, in its own essence, Substance, and reality is unchangeable; so indeed unto those who make a beginning, or do repent, as it addeth the knowledge of the means whereby it fell, and became wholly degenerate; so also it presupposeth the same Doctrine, to be as it were the foundation of the knowing of it self.

2. In the next place, concerning the Birth of forms, I have likewise shewn, how far this fraile, sensitive, and mortal Soul in us, may differ from the immortal Mind: the which surely that it is made to do, no less than after an infinite manner, is undoubtedly true, seeing the mind indeed is a Substance, not mortal; but the sensitive Soul is neither a Substance, as neither an accident: But a neither, Mortal Creature, and perishing into nothing, and of the nature of Lights.

3. Which Doctrine is in part, that of the Gospel, which speaketh concerning the Eternal Life and Death of Souls, or that which reckoneth the Soul of man to be the Image of God, and not hereafter to Die; for the distinguishing of it from the Soul of a Beast; which indeed together with the Life it self, is returned into nothing, no otherwise than as the light of a Candle. But as to the other part, the present Doctrine is plainly Paradoxal in as much as the Sensitive Soul is banished out of the predicament of a Substance, or an accident. For first of all, I have demonstrated, that the Sensitive and Beast-like Soul, as well in bruits, as that which is in us, is not infinite and immortal; yet it must needs be so, seeing none doubteth, but that every natural thing that is born, is also Subject unto Corruption by the Law of Nature. But we are

4. obliged by Faith to believe, that the mind of man is immortal hereafter: And so that the mind of man is an abiding substance, or a Spirit subsisting and Living in it self, after Separation from the body, should not be to be pressed or demonstrated to a Christian, whose understanding is subdued into the obedience of Faith; but that a most prevalent *Atheism* had lately arose in the midst of us, and in *Hypocrites* of the Church, which by an every way renouncing of the Faith, doth shake it self off from the Principles whereby such insolent rashness might be appeased: And especially of them who

5. deny all divine Power: otherwise, neither is it my part to Treat of the immortality of the mind, it being written and demonstrated by *Augustine*, and piously copied out word for word by *Lessius*, and by him re-delivered, because they are those who have sufficiently proved the same: But not yet against those which deny all Divine Power. Therefore I might desist, by treading the same under foot, to re-meditate of it, if it had been sufficiently demonstrated by them against the first sort of *Atheists*: and unless I had put a difference of the mind in nature, from every Soul of living Creatures, unless I say, the integrity or entireness of the same, should have respect unto the knowledge of nature, and that integrity should require a designed difference of man, from any other Created things whatsoever, and that singly and Principally, only according to its cheif and lively part, without which, man is nothing but a stinking dead Carcase, more vile then a Flint, and sooner destroyed and broken than any Glas. Otherwise, Christianity standing, the immortality of the Mind standeth, and the Substance of that Substander or remainer, even as also likewise the Mortality of other Souls, or their reducement into nothing, which is annihilation of a Proper Name. And from thence is the True, and properly said difference of the same.

CHAP. XLVI.

Of the Immortality of our Soul.

1. *Atheism, and that worse than Idolatry.* 2. *Religious Atheists are the worst of all.*
3. *The Life of new Religious persons which prefer themselves before others, hath introduced Atheism anew, under the Doctrine of the Pelagian.* 4. *Hypocrites abuse the Scriptures.* 5. *The Argument of perfect Atheists.* 6. *That modern Atheism was foreseen in times past.* 7. *The foolishness of their Argument.*
8. *Of what the Faith of Atheists is.* 9. *Some Arguments against Atheists, from things granted.* 10. *Every thing understood is a Lye, while it is equalized with things understood by Faith.* 11. *It is further demonstrated by the authority of Scripture.* 12. *The Bread which comes down from Heaven, Prophesied of.* 13. *The remainder out of blessed Augustine.* 14. *The mind cannot be generated by the disposition of Bodies.* 15. *A neutrality of Beings unknown to the Schools.*

THe *Jewes* of old, presently after the Cessation of miracles, were straightway hurried unto Idolatry, & a mad worshiping of Idols. But the modern Age being more wicked then they of the Circumcision, slideth voluntarily by degrees into Atheism: For Lay-men being execrably involved in daily Sins, do not only neglect God the invisible Fountaine of all good; But also some that are bound or engaged to the Church, eating up in the midst of us, the Sins of the people, do scoff at God, and protest that they are indebted nothing unto him; Because they believe nothing: Accounting the Faith itself to be a meer politick apparitious Imagination; and so, that all Religions are indifferent: Because they are those which they believe are introduced only to restrain people under a civil Law of living: and that they are therefore almost every where different, and alike just, they being divulged by the Statute Law of Princes, or right of customes received: For else it might be a free thing to believe and do any thing, if the commerces of men should not perish thereby. For there are those who do believe, and foolishly utter these things, because Priests and Religious men themselves do privily profess unto their wicked abuses; who thinking that they have reached unto the bottom of Truth, they boast of their most polished, and sublimed wits, and therefore they laugh at other good or honest persons, who implore the Grace of God in Faith, Hope, and Charity, as simple men, and almost foolish, and as those that roast themselves as a broiled Fish, in vain: And they wax daily worse and worse, the Devil stirring them up, *Who goes about as a roaring Lyon, seeking daily whom he may devour.* But especially, the evil examples of some Preachers, and Uowers of voluntary Poverty, Obedience, Humility, and Charity, do nourish Atheisms: who notwithstanding, are wholly without Humility, Charity, being altogether Ambitious, Envious, & Couetous, they overflow in Wealth, they follow their own Profits, that not only their Belly, but they themselves wholly may be a God to themselves. For truly under a Cloak of Hypocrisie, they wrest aside the Almes appointed and to be appointed for the Poor, to themselves: So as their life being diverted into a Scorn of Religion, hath driven for that cause, even the more Judicious, and also the weaker Sort, into Atheism. But the Holy Spirit shall at sometime Reforme this Madnes of Errour on both sides, who is able only to cleanse, and sweep away the Intestine filth from his Church.

In the next place, the Scripture it self entering into that evil mind, it is wrested in a wrong sense, and hath confirmed Atheism, which otherwise, ought to moue to filial obedience, and due love towards God. For first, they argue distinctively; and presently after they conclude copulatively for Atheism: To wit, they say, that Bibles do profess one only, and eternal Power, Omnipotent, and Unchangeable. Therefore either the *Chronicles* of Bibles, are the meer Fables of the *Hebrewes*; or the God or Power which the Christians do at this day Worship, or the *Turks*, is far different

different from the God of the *Jewes*. For if we know a Tree by his Fruits, and a man by his Works, the God also may be a doubtful God, which the Christians, with the *Turks*, do adore and believe, together with the *Jewes*, as one only God, remaining always Immortal: he shall be to be known and believed by his own works, and that such as befeeme him: For as many enemies, as in times past, are read to have rushed on the people of *Israel*, were overthrown by a small number, and were slain, through the Astonishment of their minds by Terrour, or by a mutual Slaughter, or killing of each other; although the Camps of the same enemies, were numerous like the Locusts, and the Camels of the same innumerable as the sand of the Sea shore: Yet through a panick fear, they ran away howling, from three hundred *Hebrews* sounding Hornes: and now and then, they slay each other with their own Sword, so as there was not one that survived, who might carry home news of all that Slaughter. Yea, without the help of Warriours, one only Angel destroyed 180. thousand by Death, and that with one only Sword. For if those things are true, which are there read, and esteemed, and the power be at this day, the same which he was in times past, and alike powerful; he ought alike powerfully to help the Christians (now his own people) against their enemies, by whom they are surrounded, and subdued or enthrall'd daily. For at this day, publick Idolatry ceaseth, which was in times past accused for the cause of overthrow; and the cause of the Divine power himself is at this day managed; if the Church, the Spouse of the same, and the Sacraments of his Body, be disgracefully trampled on, and the daily Sacrifice or Host be hung up, and mocked with great reproach: The disjunctive of both which, howsoever it be taken, doth at least, convince that that antient Deity hath failed, in manner, in Being or essence, and in power; and that the new one, or that which the Christians do now worship, (of which powers, as well as of believers, there are great discords in the whole World, hostily spoiling each other) is not alike powerful, or alike bountifal to his faithful ones, as the antient Deity was to his own *Israel* in times past: Because at this day, Angels nor Swords do no longer appear: neither do huge Camps any longer kill each other with a mutual slaughter: As neither being affrighted in crying out, do they run away from Christians armed with Chariots, on Horse-back, and with fiery Engines: & from hence our Atheists conclude, that as many as do believe an Immortal and Omnipotent Being, that is, a God, do live deceived: And from thence consequently, they do further rightly inferre:

If any Divine power doth at length die or fail, much more the mind of man which sprung from Mortal Parents. For these Arguments are those which withdraw the people of Christ, first unto a neglect of Divine worship, and at length unto the top of Atheism. After that the Devil took notice, that worshipping of Idols, and a multiplicity of Starry Gods, among the Judicious, were despised, as being loose and friuvs means whereby he might allure people unto his own Hook, he more subtilly spreads this Net of Atheism, and collected a more numerous Prey: which future Atheism God foretold by his Servants the Prophets: *The Foole hath said in his heart there is no God, the Atheists are corrupted, and become Abominable in Iniquities, there is none that can do good. God hath looked down from Heaven upon the Sons of men, to see if there be one that understandeth, or seeketh after God. For the Atheist hath said in his heart, if I might see God, an Angel, or evil Spirit; Yea or the Spirit of a man, I would verily believe that they were: But I will not believe what I do not see, or hear; all things are unaccustomed unto me, and therefore they seem incredible: But I think with Aristotle, that all knowledge, and all intellectual Learning, is made only from a fore-existing knowledge of the Senses. To whom the Devil answereth, it is good for him so to remain. And God saith; for he that to this end desireth to see, that he may believe, is now guilty of sin; but the spirit of Truth entereth not into a Soul guilty of sin; and therefore it is not convenient, that thou shouldest see those things which thou desirest to see, that thou maiest believe: For neither is sin a Means for the attaining of Faith. It is a Blasphemous and wicked Judgment, to have denied a God, or a Devil; because it was not granted to him to have seen either of the two, neither whereof is to be seen unless in an assumed Form.*

In the next place, it is a rotten and childish Argument; God doth not perform to Christians at this day, those things which he sometimes of old performed to the *Jewes*: therefore he is not the same as in times past, or is diminished from his antient power: For truly the matter is changed, not so much from the power, as from the will of God. But why he will not now, what he would in times past, it is not

our part to aske of God a reason of his own will : therefore it is a foolish Argument, God doth not now do what he did in times past, therefore he cannot do it. The *Hebrew* people was a small people, out of whom Christ ought to arise; and that people were on every side beset with Enemies, and the which, unless they had been supported with the stretched-out Arme of God, and as it were by a continual miracle, they being presently brought to nothing, had yielded as a prey to the Conqueror, from whence notwithstanding, it was decreed that the *Messias* should arise: But the condition and Law of Christians is far otherwise: For the *Israelitish* people in the hardness of their hearts, did measure the grace or favour of God, by the abounding of Wealth, Of-spring, Fruitfulness of Fruits, and their peaceable Possession: But we have known, that offences should be necessary in the Church, Tribulations also, how great soever; yet not worthy to be reckoned with the Expectations of the Age to come. And likewise it hath so pleased God, that for unjustice, Kingdoms are translated from Nation to Nation.

But that I may shew that there is the same God of the Christians, which there was in times past to the *Hebrews*; I must not indeed run back unto the written *Chronicles*, with which Atheists, the Bibles themselves are of no credit: the Argument of Atheists is to be overthrown; Seeing their understanding admits not of that which is not introduced outwardly by the Senses. Their whole Faith is from a knowledge; but that knowledge is founded in a present Sensibility, a fore-past Observation, & renouncing of Histories, and succession of Ages, for otherwise, there ought to be no less Authority of sacred, than of profane Writers: Yea all the knowledge of Atheists descends to the Eyes, to Sight, Numbers, Lines, Figures, Tones or Sounds, Weights, Motions, Smells, Touchings, Handlings, and Tasts, that is, it wholly depends on a brutal Beginning, and they are unapt to understand those things which do exceed sense: For that is the cause why they exclude themselves from the intelligible world, and do kick against the corner Stone.

8 But at leastwise, they confess that they do see and know those things which they are ignorant of; which thing happens in the Speculations of the Planets. But I wish that Atheists may measure the compass of the World, I say, the real distance of *Saturn* from us, for they shall confess for that very cause, even against their wills, the distance of so many thousand Miles, which their understanding it self will contradict by seen dimensions, or they shall of necessity incline themselves to confess, that a three-fold circuite of *Saturne*, in respect of his own Diameter, could not have arisen from himself, or of his own accord; but rather that there is some Author of these, of infinite power, wisdom, greatness, and so also of Duration, &c. But if the Atheist doth think, that the Orbs of so incomprehensible greatness, and so regular a constancy of successive changes, have been thus of their own accord from everlasting; at leastwise the perpetuity of that infinite Eternity, ought to follow a certain Law, Order, and ordained Government, which did require a certain presiding or overseeing, or ruling Being, everlasting in continuance, great, and powerful. Most miserable therefore are they, who by an utter denial of all things, do exclude Faith, and the rewards of Faith.

For let us consider the Circle of the Earth to be clothed with waters, or that place without Earth and water, to wit, that all things do of their (very) own forceable Inclination fall towards their Center; So that if two men were there, to wit, from East and West, these should touch each other with their Feet, and should look upwards with their head, even as we, and the Antipodes at this day. This I say the Atheist doth believe, although sense hath not suggested it unto him. For weighty bodies do teach indeed, their own ready Inclination of falling downwards; but that the Heaven is on every side above, in respect of one Center, and that such is the property of this Center, that there is not another like unto it; neither yet, hath the Atheist seen that property: but nevertheless, he believes it: yea, whatsoever he may at any time frame, he alwayes finds the contrary, and without that property of a Center, he believes I say, that same one only natural property in the universal Center: but he never beholds or looks into the working cause thereof, or that which is like it, in the least, and he had rather through unbelief, exclude it from himself. But at least, if there be not a God, nor he every where present, and giving all things to all, it should be all one, if all things were confounded, should fall upwards, or downwards, whether weighty Bodies did rush downwards, or upwards; whether Plants, and Beasts

Beasts did perish or not. Therefore the constancy of order & perseverance of the Species or particular kinds, do of necessity require some primitive Fountainous Being from whence they began, are, and do propagate by a continual thred, and the which doth govern all things at his own pleasure or by his own beck, and gives a constancy and Succession of Continuation, least all things should go to ruine, and be confusedly Co-mingled. Indeed he beares a universal care, and keeps things in their essence or being.

In the next place, let the Atheist consider the flowing and ebbing of the Water; To wit, that no water doth ascend of its own accord; yet that the water of the Sea, doth alwayes ascend, as well in the flowing, as ebbing of the Sea. He believes this, because he sees it; but the cause thereof he believes not, because he seeth it not; neither hath the knowledge thereof entred by sense, because it is that which contradicteth his senses. But he at least, ought to believe, that those things do happen by a cause, although he hath not known the same, by which notwithstanding, every thing hath drawn such a property. For although all particular kinds should have this kind of power of seeds and gifts from everlasting; yet nevertheless, there is not a certain universal property in the Universe, which may have respect unto all particular things, that they may be ordained, and which may know all particular things newly risen and to arise, unless it be out of, and besides the nature of all particular things: Otherwise, there should be innumerable Deities, as there were in times past: and moreover, there should be continual Divisions, and Dissolutions of the species or particular kinds. For the Atheist denies to believe, what things he knows not by sense: he sees indeed the water to be moist, but he knows not, what that is which is moist in the water, or why it is moist: Therefore he believes that which he doth not know, and that which he doth not pierce, that is, as the Beast doth: for neither shall Humane knowledge ever raise him up above its bounds, unless he be enlightned by the light, which the Atheist excludes &: he defineth all things by the Contemplation of his own conceit alone, because he reflecteth every where on all things, as to himself: Being indeed wholly carnal and vain, as long as he believes his understanding to arise from a sensual Subject.

For whatsoever is perceived by Consequence, Numbers, Figures, Proportions, and Suitings, is deceitful; as oft as he preferreth, or equalizeth the same things understood, unto things intellectually understood by Faith and Revelation. What if Science Mathematical doth abstract from real Objects, and all perceived things, and yet they are believed; why shall it be more difficult to believe things not seen, so they are revealed by a Being, which by transcending Acts, sheweth that he deserves a more full Credit?

If an Atheist can assent unto profane Histories, why not also to the sacred ones? For *Moses* was famous by many Miracles, known to all *Israel*; he writeth the History of the Creation of the World, the successive Progeny of men; in the next place, he by *Abraham* enlarged the bringing forth of *Israel* out of Bondage.

Lastly, he delivered the Law prescribed by God, being confirmed by many Miracles, before an unbelieving people.

They being indeed seen in the sight of an hundred thousand co-living people. Their Sons and Nephews subscribed to the Writings of *Moses*, and then indeed to the Traditions confirmed by their Ancestours. And that was undoubtedly believed by all the following Ages: And the Gentiles took a diligent care to have them Translated, and indeed the Seventy two miraculously Translated them, without any disagreement of words. But thus far, as well *Jewes*, and *Christians*, as *Enemies*, have believed the sacred Histories touching these things.

At length, by the Prophets, there are read predictions for many Ages, before that by profane Histories they are afterwards proved to have happened. For to *Abraham* it was promised by God, that the *Messias* should arise out of his own Stock. The same thing *Melchizedech* foretold unto him, and therefore offered a new Sacrifice of Bread and Wine unto him, which should sometime by propagating, proceed out of his Loynes. But a Sacrifice is no where offered, but to God alone. Afterwards, in the dividing of the Land of promise, there was *Bethlehem* or the house of Bread, for the Prophets had foretold that the *Messias* should from thence be born of a Virgin. The Gentiles also, saw the Bread descend from Heaven, which should destroy the camps of *Midian*: and he was called the God of *Gideon*, whom notwithstanding, *Gideon* had not yet acknowledged for his God.

This *Messias* also, *David* afterwards divinely foreknew should be born of his flock; and

and therefore he named him his Lord or God, and that he was to be a Priest after the order of *Melchizedech*: to wit, he foretold it in the Bread and Wine, by the inspiration of the divine blast. *Balaam* foretold of this God, as the Star of *Jacob*, which the *Magi* or wise men coming from the *East*, afterwards learned, that he ought to be born in *Bethlehem* or the House of Bread; and they saw his Star going before them, by admonishment whereof, they had come from the utmost parts of the *East*, to worship the Child, who only is to be worshipped. For he who fore-taught them concerning the signification of the Star, could have evidently shewed them the place wherein the Child was born, whom they sought by so remote a journey; but that, he had determined that that thing should be drawn out of the writings of the *Prophets*, for the honour of God, and the learning of People. Therefore if there be any credit to be given to sacred History; that convinceth, that God is one, that the Gods of the Nations are Devils: That this God *Messias*, his Son, was at length to be raised up out of *Abraham*, without the will of Man, of a Virgin only; that he is the Angels food which came down from Heaven, who saves those that are to be saved, freely.

And seeing the understanding of Man cannot comprehend these Mysteries, and much less fore-see them by the help of the Senses: therefore it is needful to draw the understanding into the obedience of Faith, which it can in no wise conceive of it self: Because, seeing that is of a limited power, and Faith every where of a profound obscurity, the understanding cannot comprehend an infinite term of continuance, or *The Immortality of the Soul*. Therefore the Holy Scriptures being at length, granted and believed, at least after the manner of *Chronicles*: One, Eternal, Unchangeable, Immortal, Infinite, Omnipotent, Good, True, Wise God, the Creator, Author, Sustainer, Governour, and Life of things, doth for that very cause, manifestly appear.

12 Lastly, this divine Power being granted, the arguments of St. *Augustine* do conclude for *The Immortality of the Soul*, and Life eternal, Fire eternal, Joy, Peace, also everlasting Misery or Sorrow, are to be granted: And there are Angels, evil Spirits, Prophesying dark Spirits, or the Devils Bond-slaves.

But the conceivings of these things are wanting to an understanding which savours only of the Senses, according to *Aristotle*: and words are wanting to the tongue, and positive words want Properties of Expressions, to declare those things which the Ear hath not yet heard, nor the understanding could comprehend, that which hath not yet descended into the Heart of Man, and that which is in it self undemonstrable by the Discipline of the Senses and intellectual faculty: For Faith, the reward of Faith, and expectation of the Righteous, do exceed all Sense, and whatsoever can be conceived by the understanding. Furthermore, if the mind be Immortal, and to enjoy eternal joy, if it being separated by Death from its own Mortal body, doth in very deed exist and live; therefore it is not generated by a Body, which in it self, with every disposition of it, is frail, mortal, and a dead carcass, subject to daily and any kind of importunities of successive changes. Therefore the mind is an immortal substance, a Life, of the nature of the eternal Light, not to be extinguished: And therefore, neither is it generated, or proceedeth it from a Man, Parent, or Frail-seed: much less doth it arise, or is produced of it self, but by some Eternal Beginning, which in it self is Life, Light eternal, Infinite, not to be altered, or extinguished.

But these words are of Faith, and the revelations of this eternal Light, and therefore are they eternally true.

But the Carnal Man doth not perceive those things which are of God; and therefore his Wisdom is Foolishness with God, who is Order, Integrity, Essence, the Father of Lights, and total, Independent, absolute, abstracted cause of all things, unto whom therefore is all honour due from every created thing. But he created not only the substance of the mind, that it may be a substantial Light, after the likeness or image of himself; but he also made all the living Lights of Soulified Creatures: The which indeed could not subsist in the abstract, without their concrete or composed Body, and therefore they were to perish with the Death of the same: And therefore, neither are they substances, although substantial, or after the manner of substantial Spirits: Neither therefore also of the number of Accidents, even as I have elsewhere demonstrated in the Treatise of the *Original of Forms*. Therefore the bestial Life is of a vital living Light, and a neutral Creature between a Substance and an Accident: which neutrality of Beings, hitherto unknown to the Schools, was given by the

Etymology

Etymology of the Father of Lights: So indeed, that he not only maketh the burning Light of the Sun, and Splendour of the *Glow-worm*: But also the Souls of all Souli-fied Creatures universally, whereof himself will remain even the alone Maker, and Master.

C H A P. XLVII.

The knitting or conjoyning of the Sensitive Souland Mind.

1. *Alpha and Omega.* 2. *The Body is a dead Carcase of no worth without the mind.* 3. *The natural Phylsophy of the Author is far remote from the traditions of Aristotle.* 4. *The understanding of Adam shews this truth.* 5. *That by the Prayer of Abstraction, the mind ought to be unfolded.* 6. *The Author declareth his five Professions.* 7. *From the fifth he draweth five Conclusions.* 8. *The co-knitting of the mind as of a kernel in the Sensitive Soul, as it were in a shell or husk.* 9. *Defects are from the sensitive Soul.* 10. *An Objection against Sin, and desert.* 11. *An answer to the afore-said Arguments.* 12. *By an example of the Sun.* 13. *Corrupted nature doth alwayes want the aid of Grace.* 14. *The mind, as it is the Image of God, doth endeavour as it were to create something of nothing.* 15. *The difference of conceits to be admired in a Woman great with Child,*

THose things which I have already above written, for the immortality of the Soul, being premised, I forthwith for the knowledge of the Soul, return to my Lord Jesus, who alone is the beginning of the Fathers Wisdom, the unlimiting end, the *Alpha and Omega*, or the one only Scope, in whom a total clearness of all understandings is and ought to be terminated. For the immortality of the mind being certainly known, the Soul ought to be made known to it self as much as it can: for truly, seeing the Soul the governess, doth continually employ it self about the Government of the Body; Surely nothing can be searched out in the Body (unless when by *Anatomy* alone I behold dead Carcasses) which is worth ones labour, without the knowledge of the Life or Soul: yea verily I have many times been angry with my self, that I would conceive of external and forreign things, and in the mean time, not to know who I am, who dare to contemplate of forreign, and sublime things: But the Image being not yet understood, which the mind bears before it, nor who, of what sort, or how excellent the understanding may be: And Lastly, neither after what manner an intellectual act may be formed.

Wherefore I determined with my self, that there was a far different knowledge of the Soul to be delivered to Christians, than that which hath been diligently taught by the Schools of the *Gentiles*: for look how much can be declared by words, so much also the Holy Scriptures do deliver: But the rest is (in exercising) freely obtained by Grace it self, neither doth the mind admit of any other Teacher than him, who hath commanded to be called *the alone Father and Master*: Because in very deed, all Learning which is drawn from a fore-existing knowledge of the Senses, proceeds from the Sensitive, Carnal, or Earthly Soul (and the which therefore, the *Apostle* calls *Divelsish*) enlightned indeed, but not by the very mind it self, to wit, which alone wisheth to be enlightned by its Beginning, which is above nature, and not from the observation of the Senses: Whither the state of understanding in *Adam* had respect, before the received learning of his Senses: For he had known the essences and names of living creatures, because he contemplated of these things within, in his own divine image, while he would, and by the very aspect of viewing thereof, he remembered the same: But after that the sensitive Soul began to spring up, whereinto the immortal mind was involved, the sensitive Soul alone, received the vicarship hereof: but the mind being thereby laid asleep, is scarce awakened, at leastwise, not more manifestly or lively than while it employeth it self in mental or mind-like prayer: whether that comes to pass, because, the while, it casts off from it the rains of the sensitive

Sensitive *Soul*, or next, because God requiring to be worshipped only in the Spirit, calls for his own delights to talk with the Sons of Men. Truly the Prayer of silence, and of a profound intellectual humility, did require another manner of man than my self, who am now an old man, and an ignorant Physitian: but seeing I have undertaken the natural explication of the mind, and since the essence, thinglieness, and natural nature of the mind is plainly Spiritual, and respecting its own immediate and supernatural Beginning; I ought by all means, to declare and explain the Doctrine of the mind by its exercises, that a man may be bewrayed by his Works. Therefore I beg and deserve pardon, if I shall not declare the thing according to the dignity of the matter. Divine goodness shall supply my defects, by some other more worthy than my self. But before that I proceed, let the reader know, that hitherto, I have not found a writer, which hath Meditated any thing concerning the more inward emptiness or voidness, bottom, and fabrick of the mind, or of the Creation, Beingness, Truth, or Thinglieness of its Idea: but they have rather cast or hung up this same Doctrine behind their Back, as it were irregular, unknown, and desperate, and through admiration only, elevated into a dark Smoak, neither have they looked any longer behind them, as neither within them.

For first of all, I will discover my Errors committed by thinking, and will declare the Circumstances which have sometime deceived me. For I knew first of all by Faith, that we have an Immortal Mind, therefore exceeding any the Powers of nature; because it is that which was inspired into Adam immediately by God: the same Mind also at this day, is inspired into the young, by the same Prince of Life; Because it is that in which the Kingdome of God hath of its good pleasure, established its seat, and so that *he enlightens every man that cometh into this World*, and he hath enriched it with his own free gifts of the God-head, and by his presence hath excluded the evil spirit: To wit, for which mind he vouchsafed to die, but not for the fallen Angell. I knew in the second place from the knowledge of nature, that brut Beasts have Souls, more or less prudent, and quicke-sighted; yet all frail ones, and those which hasten into nothing, and that those do perish no otherwise than as a Blast, as the light of a Candle is extinguished, and departs into nothing: And therefore that the Souls of Beasts are not Spiritual substances of a proper Name, but only the living vital lights of Soulified Creatures: The which notwithstanding are Created by God the Father only, and are dispensed according to the requirance of Seminal dispositions. I knew thirdly, that every frail and *Sensitive Soul* did issue from the seeds, occasionally and dispositively only; and therefore that it did partake of nothing of likeness or unity with the Mind of man: For although both were Created by God, yet that they were both divided asunder, no otherwise, than as a frail or Mortal Being, from a future Immortal one, or as Light that is to perish by blowing out, from a substance which should be the shining Image or likeness of the God-head. I knew in the fourth place, that in the seed of Man, dispositions and hopes lay hid, unto such a frail or Mortal Soul, no less than in the seed of a Dog unto a living Whelp. Fifthly, I knew that the *Sensitive Soul*, (even as I have proved concerning long Life, in the Treatise of the entrance of Death into humane nature,) arose in us from sin, and that it doth naturally remain afterwards, through a successive coupling of the Sexes: neither that the Mortal mind could be made by nature, Man, or any natural means.

1. Because it was a Substance. 2. Because that it was permanent or durable: and therefore. 3. That it could never be made from a perishing Being. 4. That the mind therefore ought to be made of nothing, after the manner of all Substances, without the aid of Co-operating nature. 5. And that therefore, the *Sensitive Soul*, before sin, was not in us, as neither necessary. Next I knew in the sixth place, that forthwith after transgression, the mind was fast tied to the *Sensitive Soul*: Because that in a Body subject to Death, there was nothing more near, or more a-kin to the mind, wherein it might sit; and that therefore the mind had sunk it self into that cleer and Vital beginning, as in an Inn, and had been annexed to it by God, even unto the Period of Life. For I have therefore beheld so many foolish madneses, fallacies, defects, errors, and Treasuries of men, yea and all madneses which might utterly deny all the use of the Mind, and might make its totall absence, rather than its presence to be Suspected. Seventhly, I knew that the Mortal Soul forthwith after the fall, did so over-darken the Mind in its Inn, and over-spread it being idle, and as it were detain it Sleeping, that it did Govern not only corporal actions, but it did for the most part, so dim or blacken the very presence of the mind it self, that it is able to do nothing at all, readily, in this Life, as though it were no longer belonging to its own

own right. For there is a Law in our Members, resisting the Law of our Mind. Lastly, I felt or perceived a contrary or contentious disquietness sprung up, which endeavoured to excuse the liberty, and burden of sinning: For howsoever the mind doth continually breath forth a vital beam into its vicars the sensitive Soul (because it is that which never keeps holiday, is wearied, or sleepeth) nevertheless it seemed to be so servile to the mortal Soul, in its faculties, that it is unable to enjoy its own understanding freely, but to yield to the mad will or pleasure of the sensitive Soul. Wherefore I being easily seduced through the deformities of Diseases, readily descended, because I saw that Serpents, and some Simples, yea even our house-hold excrements, did every way alter the use of the mind: indeed the powers and functions of these, to become wholly oppressed, and mad, and that we who were constituted in so great a majesty under the image of the Divinity, did become far more miserable than Beasts. For I was incited hereunto, because it did not seem agreeable to equity, or possibility, that any Poysonous frail Being, and that which is unlike to the immortality of the Mind, could Spurn against the Image of God; that it should loose all right and Prerogative, at the will of a mad Dog; and that the Power of the meanest thing should be enlarged beyond the excellency of a Being, which is infinite in duration hereafter: For it seemed, that that ought not to be capable of suffering by a frail or Mortal thing, whatsoever should by it self be immortal. But moreover the mind of a prudent man is be-set for the most part by foolishness; because almost every one doth labour in his own point of giddiness: For whosoever loveth, that which is not to be loved is ennared, and who so keeps not a proportion of suitability between things that are to be loved; now he herein beholds plausible things, as pleasing, with an affection of madness: For so Eve beheld the apple as beautiful, and therefore as pleasing, she presently took that apple, and ate.

And that thing is so usual, that the holy Scriptures say, that the number of fools is infinite. For I have gone head-long into these fallacies of errors, because I as yet knew not what the necessity, and bond of the combination of the mind, and of the Sensitive Soul was. For indeed, because the mind was now connexed unto the mortal Soul, it stood bound to this, by the right of an Inn; so that, although the mind were of it self not capable of suffering, yet because they were both combined by a conjugal bond and bride-bed of unity, so as that the mortal Soul did enjoy the sole Life of the immortal mind; it was altogether necessary, that as oft as the mortal Soul did suffer any thing by frail or mortal, hurtful things, or things hostile unto it, it should consequently also suffer that very thing, through an equality or likeness of wed-lock, a conjugal unity, and social right of hospitality. Not indeed that therefore frail things should obtain a power over an immortal Being, which is supereminently above it, and of a diverse station: but God would have the mind thus to suffer, as it being hindered by the discommodities of its Inn, it should be deprived of its own liberty of ampleness, and should hearken to the straights and anguishes of its mansion. For the immortal life of the mind is communicated to a mortal Soul, Seat, and Inn, which life notwithstanding (as otherwise, every thing received, is received after the manner and capacity of the receiver) is made mortal in that which is connexed with it, or in a mortal light: And the which may therefore also be oppressed by mortal things, that the Life may be wholly blown out: and then the mind being deprived of its Inn, is not indeed extinguished, or annihilated; but is compelled to depart, by reason of an untying and annihilating of the bond. Whatsoever therefore the mind seemeth to suffer under Life, it self indeed remaineth safe: but it doth not freely exercise its Offices, because feeling or perceivance is in the middle of the Bond.

For truly I have constantly considered the light of the Sun married as a husband to the Splendour of the Glo-worm; so as that from them both, one only thing did glitter. For that both the lights of a connexion in us, are not indeed shining Lights, but living and plainly vital ones: To wit, one Heavenly and constant; but the other wormy or corruptible. Then next, I supposed the Light of the Glo-worm to be spotted or tinged: For whether that might happen through an error of its own, or in the next place, because a tinged rhine or skin was stretched over it; at least wise, the Light of the Sun, which is alwaies constant to it self, as it had now married a tinged or stained Light shining through the Light of the Gloworm, doth as it were take on it the stain and tincture of the same, and doth as it were suffer: not indeed that the Sun doth suffer, but its Light only; because it utters forth its vital actions according to the defiled Colours of the Glo-worm; and the Light of the Glo-worm being at

length extinguished, the light of the Sun loofeth its wife, and departs into its first fountain, that it may render a reason of its performed Offices. For so the mind suffers against its will, all the madness of the *Sensitive Soul*, which the filths of the flesh do stretch over it: and a cleer or famous beam of the understanding, not being able to pierce the filths, is trodden underfoot; although in its own root, it be wholly uncapable of suffering.

13. But that which hath been already said concerning the Life, that very thing is interpreted touching the other functions of the mind. In the mean time, it is certain and manifest, that as the *Sensitive Soul* is the seat of the mind; so it is the immediate Chamber-maid or Lackey of the same: Unto whom seeing the Government, forthwith after the fall, was committed: therefore it translates into it self by an undue accustomedness, all the efficacy of the Mind. No otherwise, than as any one being accustomed to cut Bread with his left-hand, can scarce divide the same with his right-hand. Therefore the mind being Ordinarily accustomed, consenteth to whatsoever things the Sensitive, brutal Soul, from a co-partaking, spreading Beam of Life, doth commit, through a largeness of its liberty, and a licence of Custome. Wherefore in all, and through all the Journeys of this Pilgrimage, we want the helps of Divine Grace, for the which we must often, daily Pray, that we be not led into the Temptations of our Inn: The which is more distinctly manifest, when as the mind Operates in exercises plainly distinct, and far disjoyned from the *Sensitive Soul*. To which end, the power of the *Sensitive Soul* got with child, is first considered: to wit, after what manner, through the aid of a mental Beam, (for as the mind is the Image of God; so also it diligently attempts sometimes to Create something of nothing, and that from its will or beck alone) it may Create a true Cherry without the Wood, by appetite or desire only.
14. First of all, it is not to be doubted, that such a thought is appetitive or causing a desire, or affrightening, &c. not yet discursive, and much less, is it nakedly dedicated to, or suggested by the mind only. And then the Cherry thus produced, is true; but not the spot of a Cherry only: Because it every year, at set Circuits wherein the Trees do Colour their own Fruits, doth change its Colours. For the action of an imagining Woman great with Child becomes thereby the more manifest, and wrests it self out of the censure of a spot only; while as a woman seeing a certain man beheaded in the Market Place of Bruxells, presently brings forth a young bereaved of its Head, whose Head was found neer the Trunk of the Body. And that thing, I have else where rehearsed to have happened in the cutting off an arm and hand: where notwithstanding, the arm and hand were not found. At least wise, the *Sensitive Soul* being illustrated in man by a beam of the mind, doth actually and truly Operate, and therefore that thing is not so much obvious in bruits: And the which, if it should not many times happen, we should by Criticks be easily brought into Suspicion of a Covenant stricken with the evil Spirit. For because the *Sensitive Soul* alone doth not work these things; but as being illustrated by a beam of the immortal mind; therefore there is a certain similitude of Creation, which is uttered forth from the lively image of its Creatour: neither do bruit Beasts therefore in the same manner imitate this effect. Indeed by the only conceiving of passion, a Cherry is created of nothing in the Young, in that part, whereon she that is with Child, doth move forth her right-hand if it be the right; or the left-hand if it shall be the left; because that hand hath been wont to carry the Commands of the Soul. And also, the whole seminal Being of a Cherry is created without its wood, and indeed a perfect one: but not growing by degrees through seasons, even as otherwise, in a Tree where a Cherry-Tree after some years, brings forth his Fruits: But a Cherry in the Womb, or a mouse, &c. is forthwith framed: which framing Power requireth sight, and moreover disturbance, &c. that the force of the concept of the Soul may be visibly imprinted: but a need of discourses it doth not require. For neither is this same a true Creation: Because a new matter
15. is not made even of nothing; but it is a Transchangeative Creation of one thing into another, and almost at an instant: And the which, while it is now created in the conception, by an Ideal Being, and cloathed in the vital Spirit of the mother, a place is presently signified by the hand, whither it ought to be brought, and where decyphered: Through defect of which hand, the drawn Seal of the Cherry perisheth, and the Creation is made null. And that is in things which cause desire. It is otherwise, in formidable things that are acted, or ministered: because in things that are so much the stronger, the direction of the Mothers hand is not required. Indeed the hand or arm of the Young is cut off, although the Mothers hand hath remained quiet; neither is it found among the wrapperies, even as the head is; even as also, while the Young is trans-

transchanged into a Monster. But in things ministered that are not to be feared, the hand is required, as a designer of the place for the Young, that it may be wholly changed. And in those formidable things, the reason is different: Because that in the one, an act only is shewn; and in the other, a created Being: For in that, it pretends a withdrawing only; but in this, it desires to imitate, by creating something. Lastly, in these sorts, that is universal, that the effecting Mother doth not intend to make that for her Young; and so shee affixeth these Images or likenesses, not in her self, but in her Young, at the pleasure of her hand, and not at the will of the Woman conceiving that which is desirable, or afrightful: But some plausible, or timorous conceit, with a desire, or turning away, doth go before: And presently after, there follows an appetite of the conceits, with desire, or fear: Which things in this place, I have thus enlarged, that the power of a similitudinary or likenious creation of the Divine Image, may bring us into the likeness of creating a Divine love in the mind: To wit, while it self, by its own motion (not by a beam only of it self dispersed into the mortal Soul (even as in Women great with child hath already been related to be done) and by its own proper wishing, is carryed totally inward into the love of God. Ah, I would to God we might be led thither!

C H A P. XLVIII.

The Asthma or Stoppage of Breathing, and Cough.

1. The Pores of the Lungs and Sinews do lay open as long as we live. 2. Nothing rains down from the Head to the Lungs. 3. That Remedies are badly applyed to the Head in an Asthma. 4. What the Vulcan the corrupter is. 5. By what error, sweet Remedies, and Lohochs or Ecligmaes were brought in. 6. What was said is proved. 7. A censuring of usual and ordinary Medicines. 8. They have not distinguished the Remedies of the Cough, and Asthma. 9. A twofold Asthma. 10. The calamity of the Femal Sex. 11. The heedlesnesse or rashnesse of the Schools. 12. Vain experiments or attempts. 13. The activity of the Womb in an Asthma. 14. How the Womb ruleth and is ruled. 15. An Enemy in the Womb. 16. They have erred in distinguishing. 17. A Woman twice suffers every Disease. 18. A sub-division of the Asthma. 19. The Asthma hath been hitherto unknown. 20. Why Physitians may hear that which they would not hear. 21. A History of an Asthmatical Consul. 22. A History of a young noble Man, a Hunter. 23. A History of a Canonical Man. 24. A History of a Monk. 25. A History of a Citizen. 26. A History of a Man of Sixty years old. 27. A Searching out of the nest in a dry Asthma. 28. Why its nest is in the Duumvirate. 29. Why an Asthma is an Epilepsie of the Lungs. 30. The quality of an Asthmatical Poyson. 31. A History of a Countess. 32. The place of the Poyson in the Consul was divers from that in the Hunter. 33. How the Seed and Fruit of an Asthma do differ. 34. Why it suddenly invadeth. 35. Why a dry Asthma is without suspicion of a Defluxion. 36. Remedies are not to be applyed to the Head. 37. A censure or judgment of Remedies. 38. A Paragraph or Summary sentence of Paracelsus concerning an Asthma. 39. In what the deceit of Remedies may be. 40. Remedies proper to an Asthma. 41. The causes of a Womb-Asthma are by accident. 42. A History of that which went before. 43. A Doubtful Asthma, between a dry and a moist one. 44. Crafts which cause a moist Asthma. 45. A moist Asthma from Endemical things drawn in. 46. A History of an Asthmatical Man, who was presently choaked. 47. An erroneous judgment of the Lungs grown to the Pleura. 48. Anatomy being founded on bad principles, is oft-times childish or a mockery. 49. From whence death and suddain choaking is. 50. Things worthy of note about the Asthma of him of sixty years of age. 51. It is proved from hurtful things often eaten. 52. That that Asthma was from the Spleen. 53. The reason of the Schools concerning a climbing motion in an Asthmatick person is rejected. 54. A fourfold vapour. 55. An examination by the rule of a false supposition. 56. A privieshift. 57. Some considerations for the questions proposed. 58. A reason drawn by conjectures. 59. Confirming signes. 60. A moist Asthma. 61. It differs from its companion the Cough. 62. From what causes it may arise. 63. A promiscuous Asthma. 64. An appropriated Remedy, as well for the moist, as the dry Asthma. 65. Concerning the Cough from a distillation or pose. 66. Why the Snivell doth varie in the running down of a pose. 67. Some Observations. 68. That for a Cough, Phlegm doth not descend out of the Head unto the Lungs. 69. A judgment or censure of the deeper Remedies. 70. A History of a Snorting old Man. 71. The Authors opinion. 72. Of what sort the decision of the Question is. 73. Both the Keepers do hasten to the Proof, together with a History of the liquor Latex. 74. How much, and how far, the use of a Cauterie may answer. 75. An applying of drying drinks. 76. A consideration of Ecligmaes. 77. A co-knitring of the fume of Sulphur unto drink.

BEcause an Asthma or stoppage or difficulty of breathing, hath been translated unto the trifles of a Rheum or Catarrh, and the affect hath not been known, and scarce healed hitherto: Therefore I am constrained to write particularly concerning the Asthma. To which end, some things out of those that have been afore alledged, are to be repeated: To wit, that the Lungs is passable with pores or little holes, as long as we live, no otherwise than as all the Sinews are: The which is especially manifest in Opticks, if one eye being shut, the apple of the other seemeth to wax great:

But

But in death, they are shut, which otherwise, in those that are alive, are passable; and the light of the eyes of dying persons doth visibly perish, because the Optical or eye-pores being shut, the visible Spirit ceaseth and leaveth off to issue thither. This very thing, *Hippocrates* already knew in his age: and therefore, he declared the whole Body to be perspirable or breathing thorow, and conspirable or breathingly folding together. And then, I suppose it hath been already sufficiently demon-
 strated, that nothing falls down from the Head into the Wind-pipe, or Lungs, the
 which notwithstanding, is frequently and plenteously spit or reached out by the
 Cough; so that, neither is there an entire place for a feigned Distillation or Catarrh.
 But whatsoever the Cough casts forth, that that is made in the Pipes of the Lungs,
 through their proper vice: Therefore that they have erred hitherto, by reason of ig-
 norance of the part commanding, making or committing, and receiving, and by rea-
 son of rash thoughts of the matter, and manner of making. It is no wonder there-
 fore, if there hath also been nothing done in curing: Because Remedies have been
 applyed to the Head; that it might not make, or not send matter, or that matter
 might not of its own accord slide into the Lungs, which was never in the power of
 the Head, but is constantly made in the possession of the Lungs themselves: And
 therefore the sick have remained without cure, because all the care of *Physicians* was
 conversant partly about the Head, which is guiltless in this Disease, and
 partly about the preventing, and more easie ejection of filths: But not about the
 amending of that Vulcan, the corrupter, which of the good nourishment of the
 Lungs, frameth the afore said Phlegms. Indeed the ignorances of the former causes,
 hath alwaies made the Schools to direct their intentions of healing unto the effect
 & latter thing. For when they diligently observed, that Drinks & Meats were swallow-
 ed down by a straight line unto the Stomach; but to bend nothing toward the Lungs,
 they devised sweet things which might serve for expectorating, as they might cause a
 smoothness of the jaws. Then afterwards they invented more thick Syrupes, because
 they were those which they thought, by licking them in by degrees, would by a great-
 er right, slide in part unto the Lungs: But again, all things sloathfully.

For first of all, the Schools, herein, have forgotten the Head, and next their own positions.

Then in the next place, they have not considered, that if such Ecligmats should enter unto the Lungs, they would cause more straightnesses and troubles, than the filths themselves there running out, and framed by degrees: at leastwise they should heap up or increase evil by a new evil: For in that place they should not any thing profit, unless that for the future, they should through the much straightness of passages, increase the obstruction, and render it grievous. In that respect especially, because *Roses*, *Colts-foot*, *Fox-lungs*, *Sugar* &c. do not a whit answer to a curative betokening; because it is that which only requires a renewing of the changing faculty being hurt: But those Medicines which do respect a more easie expectorating, do assault the Disease behind, and its effects only. Seeing therefore, in what part the utmost ends of the rough artery do end, and breath into the Breast, the Lungs do lay open; it is sufficiently manifest, that in the Asthma, there is a straightness of the same pores. Moreover, they do as yet err, that the Remedies of the Cough do not
 any thing differ from the Remedies of the Asthma; when as notwithstanding, they
 both do greatly, and every way differ in their root and causes. There is therefore, a
 two-fold Asthma; one indeed Womanish, depending only on the government of the
 Womb; but the other is promiscuous, common to both sexes. Surely a Woman is
 miserable on both sides, which being excluded almost from all affairs, doth not, not-
 withstanding, pay a sufficient punishment, through a single Disease of any kind.

For this Asthma is so frequent to this Sex, that the Schools have dedicated every Account of the number of the Womb, which is very manifold, unto the stranglings of the Womb, and would as it were, by one head or Chapter have passed by a great volume of Diseases. For I have seen women-folks often, who by the smell of sweet Savours, besides Head-aches, and threatned Swoonings, fell straightway into an extrem difficulty of breathing: I have also observed others, who the North wind blowing, the Innocent were presently, even in Stoves or Chimneys, punished with an Asthma.

Lastly, also others, which from Anger, a sorrowful Message, drinking of Sugar, Spanish-wine, &c. or also being chidden, were presently taken with a lamentable Asthma. For the Schools being alwayes busied about corporal Actions, therefore
 also

also, do they perpetually worship Humours, and have on both sides accused Phlegm; raining indeed, down into the Lungs: That foul or stinking Vapours, should ascend out of the Womb, which should stir up their companional Vapours, as well from it self, as else-where out of the stomach, whence they should press out all the expectorated Snivel or Filth, the Author of an Asthma. For the Schools have granted to such hurtful Vapours, a safe conduct of piercing every way; whither indeed, there is not a free passage for Air: which thing is manifest, in a voluntary pressing together, or detaining of the breathing.

12 Yea although these things have place only in a moist Asthma, yet through the same ignorance, they have not desisted to try any vain things, by Clysters, Blood-letting, and Cauteries, and solutive Medicines; that even in a dry Asthma also, they might give sufficient to the revulsion of feigned Vapours.

13 Therefore they have neglected, that the Womb, by the action of Government, and almost after an influential manner, doth, at the will or beck of anger, sorrow, fear, &c. like death, stop up the aforesaid pores of the Lungs, where they end into the breast; even so as the Moon by her Aspect only, governeth the waters; because the Life and Power of the Womb, commands the whole woman: To whom indeed therefore, there is another Chin, Wit, Flesh, Hair, Blood, &c. than to a man.

And again, the furies and inundations of the aforesaid Government ceasing, her breathing is presently restored free, and that for the most part, without a notable spitting out by reaching. For neither doth the Womb rule the whole woman by the power of Vapours; but by the meer command of Government; seeing it is like unto a strange Guest, no otherwise, than as nourishably depending on the Body, even as a shrub on a Tree in which it grows.

But besides, the Womb lives in its own Square, and hath known no enemy unto it self, besides the passion of the mind: wherefore it doth not serve the Soul; but by waxing mad, it exerciseth cruelty on the mind being urgent in disturbances, no otherwise than on the Body: For only the disturbances of the mind, do drive the Womb into divers furies; So that it cruelly rageth, sometimes on the Sinews, then on the great Guts, Bones, Bowels, and Membranes: the Heart likewise, or Head, jogs the Senses and mind. For I have seen the Cords or Tendons being oftentimes pulled together with great Torment, voluntarily to leap out of their place, and to have stirred up wondrous Convulsions of the Muscles, and with great howling, to have resolved them; yea and in earnest, to have put the very Bones themselves out of their place.

16 So also, I have observed, Apoplexies, Palseys, falling-Evils, Jaundises, Dropsies, wringings of the Bowels, the Megrims, Madnesses, and much tyranny of Diseases to have proceeded from the Womb: which Diseases, even as they have been in vain attempted by the Schools by many Remedies (I will say neglected, and after some sort referred unto the choaking of the Asthma alone; as if the Throat only, by a singular Perogative should obey the Womb; so truly the Sex is worthy of much Compassion, (being given unto us for a help of great necessities) and as if it were therefore worthy of manifold misery.

17 For truly the Innocent, and devoted Sex undergoes the double punishment of Corrupted Nature, through individual womanish Miseries: once it suffers almost all Diseases from the Womb, and the same again as it is man. But it is happy likewise, in that it bears Tribulations patiently, and thus far, is nearer to the Son of God.

18 The other Asthma therefore is promiscuous to both Sexes.

But again an Asthma is subdivided into a dry, & moist one; so reckoned to be from the Filths expelled. The causes of the Asthma, and manner of its making, have hitherto remained unknown in the Schools: And consequently, the curing of an Asthma hath remained unaccustomed. Let God be witness and judge between me and the Humourists, how much I might commiserate the Sick, that are badly entertained under the unhappy flatteries of Ignorance; & at length being cut short of their hope, and of Cony-catch'd their Money, to be miserably forsaken, that is, deluded. For they being disturbed of at vain experiments, were amazed with me, that so slow or sluggish help should be

19 fetched from so many Ages, & Libraries; when as in the mean time, we have seen them oftentimes cured by poor old women, or a Juggler or Fortuneteller: Because the Schools are asleep at the complaint of the sick. For they indeed, hear the howling of sick, but with the Levites, they pass over into Jericho: and therefore they hear against their wills, that which they would not hear; To wit, that unprosperous clientships of Diseases

cases do happen daily unto them. But neither do they therefore depart so much as a Nail's breadth from their predecessors, that they may once seriously deliberate concerning the life of their Neighbour committed unto them. For to assent to or lean on old and blind guides, hath turned into sloath: therefore neither do they any more blush, to decree as many Diseases to be incurable, as they have not cloaked with Bloud-letting, a Solutive Medicine, Sweat, Clyster, a Cautey, hot Baths, drinking of Sharpish things, that is, with things that diminish the strength.

But now concerning the Asthma. And first of all I will set down some known Histories: But they who shall follow me, shall the better and more successfully trace out the same.

A Consul of a great City, of fifty years of age, being a liberal drinker, & a strong man, 21
having slidden from a Ladder in a Ship, on his shoulders and hinder part of his Head, ere while founded: returning unto himself, he was well in health for eight Months space. Afterwards he suffered a gentle Fever for some dayes: he left his drinking, because with the Fever an Asthma seized on him: every Fit, for some dayes and nights, did continually threaten Strangling: But they end without a manifest Spitting out with reaching: But the night foregoing, the onset of the Asthma was without sleep, unquiet, with dryth of mouth, a feverish Admonition, a wonderful abundance of Urine, and for the most part urgent with three Stools: And then, on the morning following, as it were at one only Fit, his breathing is at it were cut off with a broken Thred: in Breathing, as he lifts up his Shoulders and Arm-pits, he presseth both his hands on the side of the Bed, whereby he might the more easily and highly elevate his Shoulders: His countenance looks red, and his Eyes stand out: And thus he passeth over some dayes and nights without sleep, and doth continually struggle with choaking at hand: At length, the Fit being finished, he is in good Health, he Eats, Walks, Climbs, Hunts, Rides, and Journeyeth. Yea, neither remembred he that ever his head ached in his life, or that his Breast was subject to a Cough.

There was a young Man of 24. years of age, defiled with no Errour of Health or 22
Life, being Studious, Noble, and also employing himself in Hunting; Hence indeed, swift on Foot and in Running; But this man coming to Bruxels, three Leagues journey, after a moderate supper with his Sister, is first of all taken with an Asthma, and for three whole dayes space, he striues with Death through a fear of Choaking, Labours, and Sweats: presently after, he is restored without Spitting, and being well in Health, he speedily recovers his own home. For full two years space after that, he durst not lay down, but sitting by the Hearth or Fire-side, he passeth over the nights of those full years: For if he layes down, the Asthma doth presently awaken him being fast a-sleep: also now and then, the Fit threatens, yea begins; but doth not proceed: also it more cruelly afflicts him at one time than at another. It is embittered at the set times of the Moon, as also at the Seasons of the Air, the which also therefore it fore-feels and presageth. Likewise the Fit doth molest him more cruelly, and oftner in Summer than in Winter: Yea at this day it is more frequently, and cruelly urgent on him, than at its first beginning. But in the dayes between the Fits, he Walks, Runs, Rides, Hunts, and duely performeth other Offices of healthy persons, but dares not to lay down by night. He is worse in Mountaneous places; therefore scarce dares to spend a night at Bruxels. Moreover for some hours before the Fit, his Spittle becomes Salt, he feels his Teeth and Gums to be drawn together, his Bowels also to roar with a great noise, his Sides are pained on both sides; and likewise he makes frequent, and waterish Urine; and the Paunch it self being more liquid, is thrice or four times loosed. Last of all, as if a Snare were cast on him, the Asthma presently layes hold on him, and at every return, threatens a choaking throughout the whole Fit. At length, a little before the end thereof, he easily reacheth out four or five Froathy Spittings, without a Cough, and the Snare being as it were with drawn, he is presently freed. But a certaine Canonist, a man of a middle and flourishing Age, who is Asthmatical almost all the Summer, and free at Winter, doth measure a future cruelty of 23
the Fit, from the greatness of the foregoing Signs: But at what Station he is pressed with an Asthma, he itcheth throughout his whole body, casts off white Scales, and shews forth the likeness of a Leprouse. He saith, that his Mother laboured with the like Itching, as also his Sister: that she indeed thus died; but that this was cured of her own accord, after her second Child.

A certain Monk of the order of S. Francis, being a Laick of *Paula*, is busied in 24
pulling down Houses or Temples. And forthwith as oft as any place is Swept, or the Wind

Wind doth otherwise stir up the Dust, he presently falls down, being almost choaked. He is well indeed in his mind; but his Breath being almost stopped, he layes all along as ready to die; and as long afterwards, he layeth sitting. And while in regard of his order, and appetite, he eateth Fishes fried with Oyl, he presently falls down, being deprived of Breathing; so as that, he is scarce distinguished from a strangled man. He saith that he felt the Signs of the urgent Asthma which the other, the Hunter, sheweth; and that he is the more assured of the future Fit, and of its cruelty, by the like fore-token of Symptoms: To wit, while that Asthma doth voluntarily assault him, and not from Meats, or Dust.

25 A certain Citizen, a wise and prudent man, being by a Peer or great man, openly disgraced and injured; unto whom he might not answer a word, without the fear of his utmost ruine; In silence dissembles and bears the reproach: but straightway after, an Asthma ariseth, the which did daily more increase on him (otherwise in good health) for two whole years space. At length, a little before his end, a moderate Drop-sie killed him in few dayes.

26 A certain Child, presently from his Cradle, strives with a quartan Ague for two whole years; and beyond the hope of all, through a crisis or judicial Expulsion, and many Stools, he recovered; Although, by a tough falling-Sickness, he is accounted for dead. Being a Youth and young man, he was nimble enough, but of an unconstant Health. Presently from his Youth, he felt that in running, he breathed more than was meet, which he attributed to a life abounding with profits. In his Manhood he felt that a moderate Dance did punish him with a shorter Breath than was meet. But about his fiftieth year, he manifestly suspected that he was Asthmatical. And that he perceived was manifestly increased about his fixtieth year. For from his Infancy he had his Spleen notably offended, & now & then payning him; so that one dayes riding would be troublefom by reason of the jogging of his Spleen: and especially he was tired, if he had spent a day in the running of a Coach. Moreover, that falling-Sickness, although it did not bewray itself but by the more weighty Causes, otherwise laid to Sleep for some years; yet it was not convulsive, but like unto a fainting of the mind. But he felt a certain joy about the Orifice of his Stomack, and presently fell down. Indeed he seldom had a Cough; but even from his Youth, a frequent Spitting out by reaching. But he had his Spittle in small drops of a Skyish Colour, like unto Gum-Dragon dissolved. His Spittings were seldom all the Summer: more frequent in time of cold; so that old age growing great, he had very many reaching Spittings all the Winter. At length being now wholly Asthmatical, he read over a whole Psalm from the depth, in one Breath, his Speech not being stirred or interrupted, if so be he fate. He walks also in a plain, the space of a League, with a swift pace enough: but if he climbs a Street or upright ascent with a moderate step, he presently Foams, pants for Breath, his Breast is straightned, his Heart forthwith beats, with an inordinate Pulse Interruptingly: His Tongue waxeth dry behind towards his Jaws, and he Foameth about his Teeth: But besides, his Knees do almost fail with the Asthma, and according to the measure thereof, more or less; when as notwithstanding, before the Asthma, his whole Leg was nimble and strong: But in sitting, or standing, yea in walking home, he never pants for Breath, if he doth not climb. As oft as he is refreshed with a larger Supper, he pants for Breath in the night, his Breast is drawn together, and his Wind-pipe snorts with a noise as it were continually, and his Weasand would ring or tingle with Spittle. All which things are presently allayed by sitting, and he doth far more easily spit out some Phlegms by reaching, which being dispatched, he layes down backwards again. But a sparing Supper, as it gives rest to his Stomack; so also peace to his Lungs. But he perceiveth, that this his Asthma hath its Nest and primitive Fountain, in the middle space between the Mouth of his Stomach, and Navil. I thus draw out these things at Length, whereby the seeds of an Asthma may be the more manifest.

27 For truly, as well in the Consul, Citizen, and Hunter, as in the Canonist, the Asthma stands in a Poysonous seed, which hath gotten the Spirit of some Bowel for its Root and Inn. But the property of that Seed is, to contract the pores of the Lungs, whereby it gives passage for Breath into the Breast: The necessity of which constriction, doth presently appear in the Teeth and Gums: For it affecteth the whole Body, because it is dispersed into the Common Archeus, the Instrument to the whole Body: For therefore do the Reins suck the Urine, the Belly is loosened, the Bowels do rumble, Sanguification or Bloud-making Stumbles, the Heart beats; and at length, the Lungs is contracted

contracted or drawn together, even no otherwise than as the Cod under a desire of wantonizing. But the nest of the Asthma is in the Duumvirate (of which I shall treat in a particular Treatise) to wit, from whence the Government of the whole Body dependeth: For otherwise, the evil doth not sit immediately in the inflowing Spirit, the which indeed should be finished by one only Fit: for unless it had obtained a stable Root within, it should not repeat it self, as neither should it persevere.

Then in the next place, the Character of the evil, which so long as it sleepeth in a stable part, it doth not seem that it can elsewhere be established, than from whence the Government of the Body doth depend, and so also it hath assumed the Prerogative of the heart. The Asthma therefore in this, is like to the Falling-evil, the which, although it doth not strike the mind, doth not contract the Sinews, or stir up swoonings; yet it sleepeth in some Seat; whence at length it defiling the *Archeus* with a certain contagion, if it doth not contract the Sinews, yet at least wise, it doth the Lungs. Indeed, it hath a singular respect unto that Bowel: yea, although it may seem with the like speed to contract the Veins, Kidneys, and Liver; yet there is not so manifest a hurting of these, as is felt in Choaking: All which things are as yet more cleerly manifest in the Citizen, and old man of Sixty years of age: For this, retained from his Infancy, a Spleen ill affected, and also Fits of the falling-Sickness, else, his Lungs were free enough: But the other through the Agony or Passion of shame, of Anger, Revenge, and the Modesty of commanding Reason, sheweth, that the Bowel in him was hurt, wherein the first Motions of conceptions are enfolded.

We may lawfully therefore, by a Philosophical Liberty, name an Asthma the falling-Sickness of the Lungs: Indeed its Nest is in the Duumvirate; it is also a Disease of the whole Body, as it shakes all the Members before the Fit, and so also sore shaketh the Spirit the ruler of the whole body: notwithstanding it Fructifies in the Floor or Region of the Breast, and singularly respecteth the Lungs themselves, as it were the scope & proper Object of its property. That falling-Sickness of the Lungs is made by a Poyson, which by its property doth affect the Lungs, no otherwise than as a *Cantarides* doth the Instruments of the Urine. There is indeed a certain Poyson, which strikes the Head and whole man into an Epilepsie or falling-Sickness, and much more insolently and wondrously, than that it should strain the Lungs; yet the rareness or slender-ness of its affect, durst not compel unto the Position or State of any Epilepsie: when as notwithstanding, in the mean time, whatsoever cures an Epileptical man of Ripe years, doth also cure an Asthmatical one.

Also I have seen a Poyson to have arisen out of the Womb, which would strain nothing but the Oesand, so as that a Famous Matron could scarce swallow any thing for three Months. I came unto her, I knew her Malady, and presently the Lord healed her. For by reason of Leanness and Hunger, she was molested with a continual falling-Sickness, and for 37. dayes she had one only Stool to the bigness of an Acorn. In the Consul indeed, the Poyson consisteth in the Spleen, and therefore it began with a Fever, and doth alwayes so begin, because it was co-fermented in the same place with feverish beginnings: But in the Hunter, about the Mouth of the Stomach; and when it laid hold on him, he was free from feverish beginnings: And so also he begins his Fit in manner of the falling-Sickness; and also his Fit is daily, because the Ferment of his Asthma is con-centrical with the Bowel imitating the Harmony of the Heart. In this, therefore, it communes with Excentricities of Tempests; but in the other, it doth not so readily hearken unto them: For on both sides, it ought to expect the Ripeness of it self, and a co-mingling with the Spirit of the whole Body; And therefore Mountainous, and Hot places do ripen and hasten the breaking forth of that Seed, the which in another doth more easily break forth in Watery and Fenny conditions or seasons: else where, it being long silent, because requiring a feverish Seat which doth hasten the cast in Poyson, and ripeneth it unto the Period of its breaking forth. Wherefore in speaking properly, the Seed it self is the Asthma and falling-Sickness of the Lungs, although it may be silent a good while: But while it is brought to Maturity, now it is the Apple of that Tree, the Root, Fruit, on-set, and product of the lurking Asthma. And because it riseth into Act, by vertue of a vital Government, and in manner of Influences; hence it suddenly invades, no otherwise than as a Snare cast on the neck: For I esteem a man to be Asthmatical, as well out of the Fit, as within it; because a true Asthma is in him; even as a Pear-Tree is as well a Pear-Tree in Winter, as in Autuma, while it hath Pears. In the mean time I suppose every one is satisfied, at least that the aforesaid Asthmaes do not owe their Original to Phlegm flowing down into the Lungs, or to a supposed

- Rheum or Catarrhe, seeing they do suddenly invade, and are solved, without a manifest Spitting out by reaching, which might have been able so to have exercised the Lungs: Yea if any thing, a little before the end of the Fit, be by chance spit out, and that as little as may be; that ought not to undergo the reason of a former, or occasional cause, but rather, it hath the room of a product; to wit, from a great co-straitening, and unseasonable injury brought on the Lungs. Wherefore I am cruel, if I shall propose a Remedy for a Rheumy-Head, or evapourating Stomach. Hence therefore, every one that will be a wise man and a Christian, shall learn, that the careful diligences of Expectoratings in an Asthma (especially in a dry one) by Lickings, Lohochs, Syrupes, by Bloud-letting, and loosening Medicines, by the Drinks of China, Sarsaparilla, or Saffaphras (which they falsely name Dryers) are vain, and by a sparseness of Diet, Sweats, Baths, Cauteries, to wit, that they may stay, pull back, evacuate, consume, or turn away the foregoing, or conjoynd Cause of an Asthma, lifted up out of the Stomach, or otherwise materially raining down out of the Head. And therefore any undistinct Remedies, hitherto attributed by a like indiscretion, unto Coughs, and searched out by the frail events of Fortune, are in vain: in the next place, vain are the beginnings of Flowrs of Brimstone, however variously Sublimed, in so great a Malady: and hence are the counterfeited Remedies of extracted Milk, and Tinctures, although these do promise more confidently and speciously than others, and do infuse a hope, the more likely to be true, by so great a Preparation. In like manner, I understood the co-fermentings, and promises of Wine with Colts-foots, and Lung-Remedies, to be vain: And the cause being certainly known unto me, I then at length, thoroughly viewed the Paragraph or short sentence of Paracelsus, concerning the Asthma, stablished on a boasting of the Author, together with his Medicines of Tartar, Sulphur, Bawm, &c. But I found the Errhina or Medicines that purge the Head by the Nostrils, the Apophlegmatisms or Purgers of Phlegm by the Palate, caps of Saffron of the Antients, and other Medicines of the like sort, to be more foolish than these: Likewise solutives or Purgers by Stool, and Bloud-lettings, to be cruel ones;
- 39 because the dejecters of strength. I confess indeed that by those Arts, the Fits are now and then allayed, or chased away & dispersed, & that that thing hath in times past deceived me; but afterwards, it seriously repented me of my Blockishness: I acknowledge, that I then spread Masks and Cloaks over Diseases, that I healed none, but deluded as many as relied themselves on my Ignorance. Therefore, after that I stood cast on the Shoar, as unprofitable Froath, by the Storms of vulgar Ignorance; I greatly wondered, that the Schools, & Spires of so great Wits, could not yet bid adieu unto the false persuasions of Predecessors; seeing the Asthma is never taken away by any Remedy, but by the Remedy of a Secret which may pierce all the paths of the Body throughout the whole, that it may leave nothing unattempted: and so that by one only means, it overthrows the falling-Sickness, with the Asthma, and whatsoever, hath any where immediately fixed its Seat in the Dens of the Body. I except the Gowt, and the like Diseases, which have taken up their Inns immediately in the Spirit of Life. And when, in the meantime, I, as amazed, did seriously weigh my vileness or little esteem in the sight of Wits in times past so great, I could not but presently (falling down on my Face) praise the Father of Lights in the Prayer of Silence, in that he had given knowledge unto the little Ones, which he had hidden from the wise of this World: Seeing it is not of him that wills, runs, and labours; but only of God that sheweth mercy. To whom be all Honour and Glory forever.
- 41 But forasmuch as sweet Smells, Sorrow, likewise sweetnesses of Taste, did cause the Asthma, I will not have it understood, as if an Asthma should by it self be made from those causes; Seeing that in some Women, the same things are grateful, and unhurtful: but in others, instead of an Asthma, they bring forth the Megrim, beatings of the Heart, and Swoonings: For all those particulars distempers do proceed from a singular Fury of Womt-madness.
- 42 A certain rich Elder, and of a good life, had never spent his Youthful years in Lust, or Riot: in his 38th. year he becomes suddenly hoarse, he looseth by degrees his Tone and Voice, and expressed his words, being only formed by his Breath: He after the Hoarseness, wholly panting for Breath, after a years time dyeth. His Lungs being dissected, the hinder Lobe of the left side is found hard, and stony like a Pumice, and within, as it were a Clot of Bloud, had waxed Brawny throughout his Lungs: But where the rough Artery is dispersed into four Lobes, the Clots were Cheefly, of a middle consistence between a Gristle and a Pumice; and many of those small Stones were seen
- 43

seen scattered throughout the Region of the Lungs. This good man did undergo a continual Asthma, but not a returning one by Fits; yet his Spittings did not exceed: For the nourishment of the last digestion is Coagulated by a strange Ferment, whence there is a rare Asthma, a doubtful one between a moist and a dry. Diggers, Melters of Metals, Separators, Quiners, Chymists, & likewise Artificers of *Aqua Regis*, Cerussers, read-Lead, Verdigrase, Vermilion, Gilders, &c. are all of them presently taken with an Asthma, because a Gas breathed in with the Air, doth vitiate the Channels of the Wind-pipe in the sixth Digestion: From whence it comes to pass, that instead of an assimilating or likening of nourishment, it wholly degenerates into an Excrement, according to the condition of the Ferment Transchanging: Which being detained, and subsisting, the aforesaid Channels are stopped. But because the sixth Digestion it self hath contracted a Stain in its vital Powers, from the Impression of a Contagion proper to ones Country, or a real adhering of the same: Therefore Daily, yea and Hourly, such a new Excrement is bred even until Death, which is even at the Doors, where the expulsive Faculty is not sufficient for expelling of the bred Excrement by Cough: And therefore, they are then choaked with an Asthma. For the Gas of some Minerals also, do from their property, presently choak, no otherwise than as a hidden Pin doth a Dog. For the fume of the Mercury (the which, however it be Masked, yet is alwayes Mercury) doth presently stop up and constrain the Wind-pipe: For because it abhorreth Poyson, the Jaws do presently contract themselves, from the presence of an Enemy. Likewise, every hurtful Gas doth by its in-breathing, vitiate the Digestion of the Lungs: and those Filths, the witnesses of the brought-on injury, do presently bring the Tragedy to a conclusion, if they shall the more toughly adhere to them; because a new off-spring of Filths is continually bred. Therefore the Poyson of an Endemical Gas being drawn in, the fainting Lungs doth presently bring forth an Asthma. So also notable cold, as it over-masters the strength of the Lungs, produceth a moist Asthma, because it there destroys digestion.

Another Asthmatical person is suddenly strangled, although he duely cast forth his Spittings: the cause was sought for by Anatomy: There were but very few Excrements found in his Lungs: but the right Lobe, behind, was grown to the *Pleura* or inner Skin of the sides. The Physicians being content that they had found the Knot of the Matter; Behold they say, the cause of his sudden death: For the Lungs could not moove themselves, and therefore being choaked, he perished.

I being as yet but a young man, smiled, not believing that the Lungs (the which I then as yet believed to be necessarily and continually moved) had perhaps for one small hour, so firmly grown to the *Pleura* backwards (especially in one sitting) that indeed burstness it self, being compelled inwards, and straightly pressed together, should grow together unto the Lip its companion, so much against its will, even while resting in ones bed. In the mean time, that this growing to, of that which was continual, being rent asunder, should be from the betokening sign of Nature; not likewise of the *Pleura* to the Lungs, both whereof, their own coat, and scope of nature did distinguish. I despised these rashnesses of the *Schools* for the future, the more, after that I had dissected some Souldiers (that were suddenly slain) for that things sake. For I had seen the Lungs grown to the Ribs behind, in those that were in good health, and whom, no difficulty of breathing had before pressed. Among others, a certain exceeding swift Irish-man, being killed with a Dagger by the Foot-men of the Marquess of *Winchester*, and dissected, shewed both the Lobes of his Lungs to be grown to his Ribs. But if thou shalt accuse the vice of the formative faculty, or a monster; thou shalt likewise confesse it to be agreeable unto Birds: For *Anatomists*, when as they no where find feigned Humours, yet they promise to prostitute every cause of death by the knife: first of all, they admire, then also they are earnestly angry, that death should happen without their leave: For as if they had their hope and remedy in their knife, they rejoyce, that they have found a part in a dead Carcass, whereto they may attribute Death.

And then they cry out; behold a noble Bowel hath long since failed by Putrifying. Neither is it in the Power of the Physician, that the sick may alway find relief. And so Physicians do for the most part, cover their error, and comfort Heirs by trifles: Kinse-men are amazed, and do conceive a comfort from the necessity of Death. Although the putrefaction of a Bowel had fore-existed many months before, which a gangrene in the outward parts, killeth in a few daies. Indeed the nest from whence death comes, is indeed disposed unto death by degrees; but it begins to putrifie on an instant,

- instant, death approaching; and it putrifies sooner than otherwise, dead Carcases do, because it is nourished with luke-warmth. I conjectured, that that Asthmatical person died, because he being (long before) vexed with beatings of the heart, also with an intermitting Pulse, the Poyson at length attaining the properties of an Asthma, had stopped up the Pores whereby the Lungs breath into the Breast. For the action of Government in the *Duumvirate*, doth nowhere more clearly appear than in the Asthma, Fallingevill, giddiness of the Head, Drowsie evill, Apoplexy, and such like: To wit, where no stain or defilement meets in the Bowel, and in the next Place, no
49. detaining of that stranger is seen, which may stuffe up the Pores: For I have taken notice of an old man, who if he did meditate the longer in his Bed, he presently breathed with difficulty. A certain Snorter, with an Noise of Phlegms, was hardly heard; he was constrained to sit upright, that all things might allay: Otherwise, although laying along, he did expectorate very many filths, others notwithstanding did presently after spring up; To wit, presently as soon as the Mouth of the Stomack was vexed a straightness of the Lungs was present, and those filths were uncessantly made from a shutting of the Pores: For the breast being raised upright, there is a greater liberty of the Pores, and thereupon a right or straight breathing, brings ease: and so for that cause, much off-spring of Spittle was put in place, as long as a strictness of the Pores remained. Thus Sense hath taught the discursive faculty these things.
50. Furthermore, because some hurtful things being usually eaten, that strictness or straightness doth arise; it is a sign unto us, that the exciting cause of that straightness, and Progeny of phlegms doth not arise from the Lungs, but from elsewhere: From the mouth of the Stomack I say, (which now possesseth the name of the heart, because it also brings on the like Symptoms) the first or chiefe Motions do arise. Wherefore watchings, with careful Meditation, do stir up a sleeping Asthma, by reason of the difficulties caused in the parts busied in Meditating. So also Giddinesses of the Head which Survive from Yester-daies Gluttony or Drunkenness, or from the Tossing of the Sea, are taken away by Vomiting: for not because those filths contain a whirling in them; but because they do trouble or hinder the *Duumvirate* in the Mouth of the Stomack. Now I will Speak of the man of sixty years old.
- For this man in the beginning, never suffered a disturbance of breathing, but in an ascending, and swift Motion: And else, he hath an open, free breathing, and that according to his wish: Wherefore he wants the Asthma of a Proper Name: For although he hath tender Lungs, and those impatient of cold, and through colds, fruitful in much excrement, yet in respect of these, he undergoes rather a Cough, than an Asthma. But why is his breathing straightned in time of Motion? Is it from a mattery Imposthume, or a corrupt swelling enclosed within? But it is manifest, that not from either of these two; because being out of Motion, he feels neither pain in his Breast, neither doth he draw constrained air in rest.
51. That which is to be noted in him, is a Quartane making its residence in his Spleen, of a Child, and sometimes stirring up his swoonings, in so tender a health and Commotion of his Lungs, the which, sleep failing, doth not bear the labour of Cogitations, but it frameth Snorting Phlegms: for it clearly appeareth, what I have elsewhere said: that the Lungs in man, is a Member which first dieth, and the rather in this man, who was given to Spittings from his Youth. What if the Lungs do breath air into the Breast through a thousand Pores or little Holes, and so of the same are stopped up, shall
52. not spittings out by reaching occasionally increase in cold Seasons? But at least wise the doubt is not solved, why he walking with a swift pace, up a steep place, or in a plain, doth not equally pant for Breath, as in climbing with a slow step: or why his hear then beareth? But the *Schools* have added a ready cause: To wit, because every Motion doth of its own nature, stir up Smoaks, and therefore the more Smoakiness do accompany the greater Motion, for expelling whereof, a more swift Breathing is required: but they say nothing: For truly, besides the supposition of a false-hood, the same doubt doth as yet remain, as before: To wit, why a swift motion in a plain, and a swifter, together with a jogging of the whole Body, in descending, doth not stir up so many Smoaks, as a slow motion, in climbing a steep or hilly street by degrees, doth? For the trouble of a slow ascent, is not of the Bowels, or Lungs, but of the Shanks or Legs: shall therefore those plenty of Smoakiness be made in the Muscles of the Legs, which may provoke the Breast to pant for Breath, and the Heart to beat? And shall Smoaks find a way from the Superficies to the Center, which nature should rather expel by the pores, than to call back inwards? And then let them explain, what

what they understand by the Etymology of Smoaks. For their Aristotle reckons up only two: to wit, a moist one, which he calls a watery vapour: and a dry or oylie one, which he names an exhalation. Also Chymistry adds a third, unknown to the Peripateticks: while a body it self doth ascend from things co-knit unto it, in manner of a Smoak, and fastens it self to the Ribs or sides of Vessels, it is called a Sublimate: so Sulphur, Arsenick, Camphour, Mercury, the fire-stone, Zinck, Sal Armoniac, &c. do afford their own vapours, undistinct from their auntient Body. I in the next place, have adjoyned a forth Smoakiness; To wit, while a solide Body, by virtue of a ferment, is disposed into a flatus or windy blast, or wild Gas. But seeing the Peripateticks have acknowledged only the two former, the Galenick *Schools* have also undistinctly understood them both, by the name of Smoakinesses. But first of all, that waterish vapours cannot be admitted, I do even from hence collect; To wit, because then, Sweats flowing forth more plentifully in Summer, also the Body being quier, they should of necessity, more vex this Asthmatical man, even than an ascending upwards in a more cold Air; which is false. But if therefore, under the name of Smoakiness, they do understand an exhalation; It is certain in the first place, that those are not stirred up, unless, the watery ones shall first fail: seeing that doth not so come to pass in living Persons; of necessity also, for want of a Smoakiness, the *Schools* do not understand themselves, in their aforesaid Reason, as neither in either Columnne of the Pulses, demonstrated in the Chapter of the Blas of the pulses. Neither at length, that by the name of Smoaks, both vapours together, are understood, it is manifest: For if by a like degree of heat, dry things with moist, cannot equally climbe, or be separated from their whole entire bodies, it follows, that the Smoaks assigned are not to be granted, nor are they for the cause. But go to, let impossible and unnamed Smoakinesses be supposed, which they will have to breath forth out of us by an unsensible transpiration; yet, they are not yet examined, whether they war under the ranks of vapours, or indeed of exhalations: Because the *Schools* have been ignorant, that the whole blood in us is blown away by a far different help, than that of heat. But at leastwise by the rule of false-hood, let us examine, where those supposed Smoaks are stirred up by an ascending upward, & that a moderate one, which else, in a more swift going, are quiet: For are they stirred up in the Lungs themselves? So that they may spur up these unto the necessities of puffing away: But the Lungs are never moved, whether the Legs do ascend or descend: And the Lungs are (otherwise) supposed, to breath freely in the aforesaid old man: what therefore doth ascending touch the Lungs, that they may Belch forth the more plentiful Smoakinesses? But if Smoaks are stirred up in the Legs, as labouring the more strongly; why at leastwise, after feeding, is ascending more difficult as to the Breath, than with a fasting Stomack? Do therefore the *Schools* understand the Smoakinesses of Meats? But why shall those molest the Legs after meat? But if the more plentiful number of Smoaks are reckoned to be made in the Heart, or the Shop-bowells; yet this at least is to confound the Spirit of Life with a Smoak, a Bowel with an emunctory, & to have held the reason alleadged in the Chapter of the Blas of man, of no esteem. But if therefore Smoaks, are judged to be the Smells & vapours arising from meats; but they will have them to be brought in a straight line to the Head, & so to bring forth Catarrhs; at leastwise they are in no wise brought into the Heart. For neither is it a meet thing, but it is a new invention, that the heart should be provoked with the Smells of Meats. Neither is the membrane of the Stomack so passable, that it doth admit, of another utterance or passage, besides the Throat and the Pylorus, for Belching and breaking Wind, the which notwithstanding, are far more thin than vapours. Why therefore, the Legs being moved by ascending, should so many Smoakinesses be made, which do reach the Heart? Do require a difficulty of Breathing? And the which, else, by a more swift steep motion, do not arise? For if they by chance are formed in the veins and arteries, or without the same; yet it do not as yet from thence appear, why a slower ascent and motion may bring forth more Smoaks in the vessels, than a swift motion of the same Muscles, in descending. But if the aforesaid Smoaks be bred without the Vessels, now besides the absurdity before rehearsed, likewise, by what way, shall Smoakinesses so suddenly proceed from thence, unto the Heart and Lungs? Seeing otherwise, if one that is not Asthmatical, swiftly running, should have any Smoaks, they should, together with the sweat, sooner exhale out thorow the skin, than they should desire the inward parts by a retrograde motion. Wherefore, there is another cause, for the sake whereof the Breast is strained, the heart beateth, the jaws wax dry, although the Mouth being shut, they do breath with difficulty, only through

54.

55.

through the Nostrils, but the Tongue is froathy about the Teeth, and the Cheeks do fall: indeed by the same cause, all that are in good health in their Lungs, are distinguished, and are free from every Cough, and Asthma; one whereof nevertheless, is preferred before the other, in a swift and longer running without difficulty of breathing. Therefore our man of sixty years old, doth more difficulty climb Hilly places, and after meat, most difficulty; and as oft as he pants for breath, his knees wax feeble. Shall therefore meat and Drink make Smoaks, whereby the strength of the Knees doth decay? If this be true: But then that shall happen also to those that are not Asthmatical, who notwithstanding, having taken no Meat, are the stronger. But they will say; the Stomack being filled, a vacuum or emptiness is diminished in the Breast. Rightly spoken:

56. But this is to have gone back from a Smoak, and to have fled unto the anguishes of place. Why therefore likewise, do not all breath with difficulty after Meat, in a moderate ascending, if the region of the breast be equally diminished in all, after meat is taken? Is perhaps the region of the Breast extended by descending, or walking in a plain? A reason indeed is given of a less breathing after Meat, than before: but it squares not to the question, to wit, why in climbing with a mean Pace, any one doth pant for Breath, who by any the more swift motion through a plain way, is not short-winded? But inasmuch as that doth more vex one after Meat, it is rightly argued from an unequal straightness of place; but the Lungs are not pressed together by a Stomack moderately filled, that they may thereby become difficult in breathing: For else, why after making water, and going to stool, also after breaking Winds, is this man of sixty years old, equally panting for breath, and short-winded in a climbing motion? Indeed being fasting (and more strongly after feeding) he feels, in moving upwards, as it were a girdle in his Ribs, a beating pulse, and interruptingly happening on him: But nevertheless, he breaths in a long breath, at pleasure, without hinderance, that is, he hath his Lungs open and free, although breathing with difficulty, and his spittings are frequent, and froathy; but throughout all a cold season, much Spitting, with expulsion by reaching, most like unto Gumme Dragon dissolved: but besides he Coughs very Seldom. Truly as I have not had any thing as to cleerness, for the knowledge of diseases, from predecessours; I at first considered, that all Asthmatical persons do undergo some vice of the Lungs, an external obstruder being there grown together, or an internal one, to wit, which is co-thickned in the outward Mouths of the rough artery, whereby they breath into the breast: But forthwith, neither of them pleased me; because the Asthma doth suddenly invade some persons, and forsakes them without any notable Spitting: Also, the afore said man of sixty years old, doth swiftly, and freely draw a long Breath, without hinderance: Yea, he sitting, and that in the Smoak, doth no less freely Breath, than indeed any healthy Person.

57. I considered therefore, whether perhaps, the *Muscles* of the *Legs* being the more deeply contracted, and elevated by ascending, and the which otherwise, walking in a plain, or steep ground, do as it were hang down, the belly of the *Muscle* being in the mean time, Globy, in ascending, and pressing its artery together, might contain a nearer cause of difficult breathing. Do therefore in this motion, the *Muscles* hinder the Arteries, and also the Pulse of the same, by successive turns, that hence the ascending may be with a more difficult Breathing? Next, I considered, whether in ascending, the breath be a little longer retained, than otherwise, in a plain or steep Motion? Indeed every one doth more press his breath together, while he intends to moove any thing the more strongly. Thirdly, I considered, that in ascending, the breath is interrupted almost at every pace; no otherwise, than as if any one should at every pace, say Ha, Ha, Ha, whereas otherwise, in a steep or plain motion, there is one only and continual Ha, not interrupted by rest. I doubted also, whether the Lungs do labour with a passion of its own, and the Bowel be in a climbing motion, intent, not to expel smoakiness, how great a conceived error soever it may overcome. I also beheld or considered, that any one doth more easily walk seven hours space, than stand five; Because in standing the *Muscle* of both *Knee-pans* is continually bent on both sides; which in going, rejoiceth in a contrary rest: But he that goeth, doth more difficultly breath, than he that standeth; because many *Muscles* do successively labour in going: but in standing, although they are bent, yet they are not moved: Whence, I learned, that a cheerful motion of many *Muscles*, doth make one to breath the more difficultly. Lastly, although every one of these considerations should have some weight in them; yet all being con-

nexed in one, they could not yet satisfy the question proposed; To wit, why a slower ascending motion doth cause difficulty of breathing, but not a swifter descending one: Wherefore I have added to these things, that in a moving upwards, how slow soever the straight *Muscles* of the neather belly do stretch themselves, that they suffer not the belly to be sufficiently lifted up. Truly the Breast and Ribs, are indeed, in difficult Breathing, more largely stretched out; but (as I have taught concerning Catarrhs) the motion of the Ribs is not primary and principal for Breathing, but only an assistant, while the principal one is not sufficient: Therefore the Belly not being sufficiently extended, a difficulty of Breathing is presently hastened; to wit, it being willing to recompence the fore-going errors and defect. Nevertheless, although it may be lawful from the aforesaid considerations, to prove a greater necessity of difficult Breathing; yet at leastwise, they do nothing convince, why there is a straightned Breathing in our Man of sixty Years old; but otherwise, in a healthy person, not any at all: And seeing in the Man of sixty Years old, the Lungs do want obstruction, even as is manifest from the signs supposed; it must needs be also, that his defect be fetched from elsewhere, especially, seeing he feels in his Abdomen or lower Belly the place of his Stomack, pressings together, the causes of his Asthma: Therefore his Asthma is from the Spleen being ill affected, and that from the Duumvirate, and the cause is stirred up by an ascending motion (otherwise sleeping) by reason of the considerations above, which by the action of government, doth otherwise, strain a weak Lungs, by aspect only, no otherwise than as was declared concerning a dry Asthma; whither a lurking Falling-sickness, the pain of the Spleen after riding, the fore shaking of the whole Body, in riding, &c. do tend: Moreover that I may give the more safe judgment, whether the Lungs did labour by a passion of its own, or indeed by a secondary passion; I busily enquired, whether he felt carnal copulation troublesome unto him; and he confessed to me, that before the Asthma was manifested, *Venus* had hurt him, that after the flesh layd he felt cold in his Breast, a looseness in his Muscles, and fainting threatened unto him; But in voluntary pollutions, that he experienced no such thing: At length in his old age, presently after a seldome carnal act, that he perceived a shorter of Phlegms in his rough Artery, or else, silence: Whence I certainly conjectured, that seeing from an Infant, he had retained his Spleen troubled by a Quartane-ague, and falling-sickness, and that the Milt is the nest of carnal Lust, because in the case proposed, the Duumvirate strikes the Lungs with a right Line, especially being prostrated by an unequal strength; that the provoking, and radical cause of his Asthma was in the Spleen; yet so, as that the Lungs doth not altogether want blame, although it labour not with the first or chief affect of the Asthma: For it sufficeth, that it is trodden down by an unequal strength, that the Duumvirate may exercise on it its own disease Tyranny: For if the Lungs should labour with an Asthma from a primary or first affect or moving, they should continually pant for Breath, and breath forth a difficult air. Indeed a thin or slender poyson layes hid in the Duumvirate, which is the cause of this dry Asthma, ordinarily fast asleep in it self, nor awakened but by too much motion; and so in climbing, sooner than in descending; for the considerations of the oblique *Muscles* of the bottom of the Belly, afore-touched: Neither doth that poyson strike the Heart, and Lungs materially, in manner of an exhalation, vapour, or Smoakiness, but by the action of Government: And seeing the Heart doth beat, the pulse is inordinate, and also a great and frequent panting for Breath is desired: and the place between the *Navil* and mouth of the Stomack, is vexed from one only cause stirred up, and by one only motion, and after a like manner, it becomes undoubted, that there is one only Poyson which may affect the vital power of the Heart, and Lungs. Then also, he is vexed more grievously, manifestly, and cruelly every Year, because an unacceptable guest abiding in the Spleen, doth daily through old age, become more troublesome. And these things I have more strongly concluded with my self, because that Asthmatical Man doth complain, that for many Years, his left hand was now and then astonied or stupified, and that he was cold in the Palm or hollow of his Hand, under the auricular or ear vein, and likewise that his left shoulder did greatly pain him, although laden with a light habite, if he walketh the farther, although but modestly: For I have observed, that all Splenetick persons, when the Spleen begins by reason of old age, to fail of its office, do difficultly breath. This therefore is sufficient to be spoken concerning the Asthma of the Man of sixty Years of age: one thing only, I will here note; to wit, that his left hand, in the length of the palm,

58

59

- palm, doth pain him, through cold piercing it, and likewise that his fingers are now and then benumbed from the discommodities of his Spleen: that that is made by the action of Government. But if the Schools do command, that that comes to pass by reason of blind vapours, at leastwise, let them strew the way, whereby they may go thitherto. The archer therefore, of this Asthma is in the Duumvirate; but his
- 60 mark is the Lungs. Therefore there is a two-fold Asthma, a moist, and a dry one: That indeed hath found its name from a plenteous spitting by reaching, and for the most part, is made by the proper vice of the Lungs, and so is continual, and doth more trouble one at seasons, the cold and the moist, in old age, weakness, and things a-kin to Death: But a dry Asthma is for the most part, interrupted: And even as it tumultuously sore shaketh the whole Body (even the Teeth) with a confusion of the vital Spirits, it must needs be the Falling-sickness of the Lungs, wherein the Lungs alone suffereth a constraining or convulsion of it self, because it causeth a straining together of the Pores thereof: For in this Asthma, the whole Archeus is defiled in its root; some part (to wit, the Womb, or Spleen, &c.) doth first affect the inbred Spirit of the Lungs by the action of government: And therefore, from an invisible, and sudden immaterial storm, the whole Body is sore shaken, and is again suddenly restored to an unhop'd for health. In vain therefore are openings of the pores hitherto unknown, attempted in a dry Asthma; and in vain are many and easie expectoratings, because they are cloakative and vain helps, as many as are intent on products or effects: indeed vain are the Remedies which are wont to be administred in Coughs, seeing the Cough doth most far differ from a dry Asthma. But a moist Asthma,
- 61 although it for the most part produeth the Cough, that it may expectorate the produced Snivelliness, yet it is severed from the Cough in the whole particular kind; because it is wont to be bred from many causes: For it hath either a mattery imposthume, or some secret phlegm obstructing in the very bowell it self, or an imprinted mark of some cold, or some other injury, from whence it may bring forth many muckinesses or snivels, and corrupt its proper nourishment. Oft-times also those muckinesses are stirred up, not so much from the malady of the Bowell, as from the
- 62 weakness of the wandring keeper: Although this kind of vice, doth rather bring forth a Cough than an Asthma, yet they do easily happen or agree together for the unequal strength of the Lungs, and obstruction thereof: The feeble keeper doth easily faint at any adverse things brought against him, such as are smoaks or fumes, and the Gas of minerals, mettals, and strong Chymical Waters, the which indeed, do so hurt the very power of the Bowell, that for the future, it ceaseth not to bring forth continual phlegms, from its own nourishments: The presence whereof constraineth such artificers to struggle with a continual Asthma, Cough, and spitting forth by reaching. In the next place, an Asthma is partly dry, and partly moist; to wit, which by reason of receiving Endemics, drawn by a slender supping, or snuffing up, doth affect the tender Lungs; and that doth not, but by some endemical injuries offered, or otherwise, sink under an inordinacy of life, and is exasperated. Lastly, a Scirrhus or hard swelling in the skin, the Dropsie, &c. although they bring forth the affect of difficult Breathing, yet, seeing they are burthened with a strange Weight, they are not the Asthma. But the jaundise, by a poyson proper to it, produceth a dry Asthma. Last of all, those
- 64 Remedies are due to a dry Asthma, which are for an inveterate Falling-sickness: But great comforters, and restoratives, as well in respect of the Lungs, as of the Keeper, are required for a moist Asthma.
- 65 Now I will add my own observations concerning the Cough, by reason of the nearness or affinity of an Asthma, and the cruelties of a Catarrh: For I am wont to be taken with a stuffing in the head or Pose, because my head is weakned, and doth suffer an unequal strength through the injuries of distillations. But I have understood my pose to be, as oft as the wandring keeper had dashed snivel, about, or within the Ethmoides or spongie or straining bone. The pose therefore arising, if in the same evening, I shall breath into my nostrils a sneezing powder of black *Helebour* and Sugar of equal quantity, on the morning following, I am for the most part better: But if I shall do that to an inveterate pose, it doth not so easily depart: Yea I have profited so much by that sneezing powder, that now I could endure the evening air without hurt: wherefore neither, doth a foolish person (according to the Poets) vainly stand in need of *Helebour*. For although there are very many vomitive Medicines: yet *Helebour* seemeth peculiarly to profit the Head: Therefore the snivel, doth at first, drop down like salt water through the nostrils, and Jawes, on the same side (if not on both sides)

ides) whereon the spongie bone is beset: but the jaws hardly bearing the unaccustomed snivel, are wont thereby, together with the adjacent parts, to wax red, and become swollen with inflammation: And the snivel waxeth thick and yellow, as if that which is stuffed into the spongie bone, did (instead of a ferment) continually infect the snivel falling down. Indeed the wandring keeper perceiving the Enemy dashed on him, doth first endeavour to wash him off, with thin snivel. I being about to speak of the Cough, have begun with the pose, because this, if it be strong, doth stir up, and fore-go the Cough: and that I have alwaies observed. Therefore in the first dayes of the pose, a certain dry small Cough, with an itching of the rough Artery, doth molest, and sometimes causeth hoarsness; but oft-times, a tickling only in the wind-pipe, one or two fingers below the chin. If there be carelesness of a Remedy, yellow, tough, and much snivel is wiped off; yea and by an easie Cough knocked out: There was hope thereupon, that in a short time the affect would be loosed of its own accord: Neglect increaseth, and the external injury is urgent. In the meantime, the pipe or channel unto the instrument of smelling, or spongie bone, is wholly stopt up with a strange guest: Thence a plentiful and glewie snivel is powred thorow the nostrills, otherwise wide or open enough; straightway after, a like snivel is expelled by a Cough: But that this is generated in the Lungs, but not that it drops down from the Head into the rough Artery, I have already convinced concerning Rheums: and I add, that although all of what sort is detained within the wind-pipe and the more near branches thereof, be cast forth in the morning by the Cough, and that afterwards the breath is free, yea I being attentive, from the region of sight, that the tongue is often suppressed, contemplated, whether the left muckiness doth threaten a falling into the jaws, and be dispatched by spitting with reaching: nevertheless I presently thereupon, certainly found, that a snorting in the wind-pipe, and tingling out of the Breast, is under-heard, and a saffrony, and tough snivel follows after by intervals, yea by how much the more I shall Cough, by so much my labour is the more apt to Cough, and I am the more constrained to Cough: For I have certainly found a daily generating of the same snivel in the Lungs. Secondly, that my pose doth hurt and take away, not only my smelling, but also my tasting, although distinguished or seperated in a peculiar Organ: So as now and then, I could not taste a Clove. I learned therefore by my malady, that the defect was not only conversant about the Organ of smelling, or in the stuffed bone; but also that I felt a blemish propagated into the neighbouring Brain, whence the tastive Sinews were made companions of the contagion: wherefore I further discerned, that the Brain being thus defiled by the borrowed blemish, did infect its own keeper, which afterwards affecteth the other neighbour-keeper with its weakness; wherefore a Cough is thus oft-times bred by a pose, and that Cough according to the tenour of this pose, is extended, promoted, and continued: Yet the same injury, doth oft-times, by a like action at once, affect, as well the keeper of the brain, as that of the wind-pipe: But that the Brain doth immediately infect the Lungs into this blemish, by the action of government, this might be a reason to me, because the aforesaid man of sixty yeers old, if he had offended his mind with a more fervent contemplation, and had made half the night restless, presently, without offence of the keeper, he found a snorting to arise, and phlegms to be ingendred in him, which would not be stayed in growing, unless the disquietness of his mind being first appeased by sleep: For it belongs to a family-authority, if the Dumvirate be able badly to season the Head, Lungs, and other parts, that the Head doth snatch the parts beneath it, into its own client-ship or protection. I have likewise also observed this, that as oft as the Cough did proceed from a pose, so often, remedies which do cure the pose, do also heal the Cough; and such a Cough is easily known by a slow small Fever, a more coloured Urine, and then the propagation of snivel is more continual: For that is the Fever of a Head ill disposed, and communicating its own grief unto inferiour parts: For there is a prerogative of the Head in this, that although the Cough shall happen upon a pose, yet they are both ended together: and then, although thou shalt cleanse thy nostrills wholly of all snivel, yet the Cough arising, snivel doth forthwith flow abundantly out of the nostrills. Therefore there is a great co-resemblance of action between the Head and the Lungs; not indeed that the Head doth lay up its own portions or conditions into the Lungs, but as at the hurting of the smelling, the brain takes away together with it, the tasting also: So also it wrests the Lungs into the union of it self, because both Bowels are of one nourishment, also both keepers do generate a co-like snivel of the same, as a vassal bewails

the chance or fortune of his Prince. Then in the next place, there is the more strict necessity to the Head with the Lungs, because both Bowels do conspire in the government of the Keeper, readily serving for the same end. These things are thus to be pressed from the root, that the cure may be directed unto the roots, unto the antecedent, that is, to the freeing of the spongy bone: For truly, the cough being sprung from the action of government, whatsoever Cough is in the Lungs by accident, ceaseth, the pose being removed. A coughing person, if he sit, the snivel doth the less snort in the wind-pipe, his breath is more free, and his expectorating more easie, (for hence is the name of orthopnea or upright breathing with difficulty) when as otherwise, if snivel should distil from above into the wind-pipe, it should hasten downwards rather in sitting than in laying; which is false: therefore also the antecedent.

68 For if it should fall down from the Head into the Lungs, it should descend with less trouble, and should be more easily received in the Lungs, as long as at the beginning of the pose, it is expunged in manner of water: It should then (I say) easily fill up the Lungs, and by its quantity, intercept the breath: but at the beginning of a pose, there is yet no Cough, and next, no difficulty of Breathing: therefore there is no falling down of snivel out of the Head into the Lungs, in a Cough. But as touching a Cough, which is made by the proper malady of the Lungs, and not from the pose, I have already treated before.

But as to that which concerns Remedies, first of all, soporiferous or sleep-causing things do ease the Cough, and the pose, as they do also appease a Pleurisie from symptomatical affects: And I conquer the Cough with those Remedies, wherewith I do the Pleurisie. There are also in the next place, other Coughs, never arising from a pose, but from a corruption of contagion of the air, also from an unreasonable impression of the greatest cold; and the Lungs are offended in their strengthening or liveliness, no otherwise than as is the wandering keeper before the door: But the excrement which hath overflowed longer than was meet, about the utmost parts or ends of the rough artery, is hardened, and moreover affords a difficult breathing: And the Lungs being weary of this guest, do shew forth tokens of their wearisomeness, by spitting out of the vitiated excrement, by reaching: And if that excrement be not chased away by Coughs, or inwardly, it ends into a mattery imposthume, and consumption. But a sitting life hath oft-times brought this evil; wherefore I have alwaies perswaded unto exercises which provoke difficulty of Breathing, whereby excrements may be expectorated or cast out of the Breast, and the overflowing by force of the air, may be hindered: surely no otherwise, than as havens of the Sea, do require waters flowing on their back, which do wash off Sand from thence: For otherwise, the filth subsisting, the Lungs cannot choose but sustain a hurting of their liveliness, bring forth many and divers spittles, according to the disposition of the blemish received. Such Coughs have an adhering and strange filth, and do successively beget another, which afterwards do end into difficulties of Breathing, Asthmaes, gnawings of the vessels, and of the substance of the bowel: Many of these defects, because they witness a weakness of the vital strength in the bowel, are difficultly restored, and less in old age. But an Asthma sprung from thence, hath as many floud-gates of air shut, as there are little mouths dedicated to breathing: And this is the difference of degrees, in a greater and less straightness of Breathing. But the filths or spittles which do bewray themselves in these affects, are not so much the original causes of the Cough, as they bear the relation of a product for new Coughs continually: For they grow alwaies anew for them, because a hateful guest being within, doth not cease to stir up new filths from the last digestion. Indeed such is the negligence of this bowel, and the command of external things over the wandering keeper. But the Remedies which do as well cure the Falling-sickness of the Lungs, or dry Asthma, as those which cure a moist one, ought to be renewers, and to arise unto the largeness of a general kind: Because they are such which ought to contain a restoring of the weakness contracted: To wit, these are the greater Secrets of *Paracelsus*, of which elsewhere: And likewise which do Sympathetically overcome every Disease; For *Arcanum's* do by an every way purifying, take away any Diseases: but seeing they do not infuse new strength into the vitiated part, as neither do take away the evil impression of the implanted spirit; surely, the lost strength is not after any sort to be restored, but by Sympathetical Remedies. But that some fruit may be cropped from what hath been said before. I will relate one example out of ordinary and domestical ones.

70 A certain old man did Snort after a wonderful manner, so that he seemed sometimes to

to sing, sometimes also to snort with his weasand : that he being oftentimes raised upright all night, was also compelled to sleep in sitting, and he uttered less noyse, and fewer Phlegms, sitting than laying : his Physitians therefore, refreshed him with Meat-broaths perfectly boyled, with a more strong and plentiful nourishment, least he should fail of much Spitting out by reaching, or should suffer a Consumption of the Lungs which they said was threatned : Yet he felt himself better under fastings, and in time of *Lent*, then presently after *Easter* : But his Physitians did accuse, sometimes the North-wind, but then the Rain; but not his much juicie and more strong nourishments.

But I went occasionally to see the man, and when I seriously minded all things in my Power, I presently shewed that that generation of Phlegms, had its domestical or homebred cause in the Lungs; but not that it did slide down from above into the Lungs, or that his Lungs did languish with a secondary passion. And moreover, as the generating of Phlegm was made in the Lungs it self; so also, the plenty or abundance thereof did not proceed from an increase of a diseasifying cause, but rather from the abounding of good and much juicie nourishment : So as that evil would most certainly come, from whence others divined good to come, who scoffed at me with a secret loud laughter. And when I endeavoured to wipe off, and strengthen my assertion with wine; to wit, that the moderate drinking of Wine would fortifie him, whom otherwise, the excess of the same Wine would render subject to much Spitting; Yet when as they would not fall, being smitten by one weapon, I descended unto the experience of *Lent* and *Easter* now gone and past : And that (indeed) forthwith after *Easter*, he more plentifully spat by reaching, and did more troublesomely snort. But in fastings, he was scarce, or at leastwise little mindful of these. Wherefore for deciding of the Question, I said there was need of proof, and that I was (at least) to be as much boren with, as other unprosperous helpers hitherto : wherefore after a more sparing and hard food (the which indeed might satisfie a hungry Stomack in digesting, although not so desired a fulness of Bloud) the Orthopnea or difficult upright breathing was presently diminished, which afterwards, by a continued Moderation of abstinence, afforded quietnesses of the Night : For as the Lungs being ill affected, the more excrementous Phlegm is begotten; so, by how much the more plentiful matter is present, the same excrement doth the more abound : Because it is not made (this something) but by a matter the more nearly disposed : For neither is that Phlegm, whether it be thin and watery, or next, more gross and tough, but from a mass of matter the more akin and disposed; to wit, the which also sayling, the vital Bloud is self is transchanged, & passeth over into these excrements. There is indeed, a watery liquor of juyce wandring throughout all the veins in the Body, receiving diverse masks of a watery excrement, and putting on diverse Ideas; no otherwise than as water wherein the Bark of the Teile-Tree, or the root of Comphry have been steeped, dissembles the shew of a Phlegm : also the very white of an Egge, on the first day is Milky, the which, by a voluntary Motion, doth presently snatch to it the thickness of Glew : The which, in a pose is more cleerly seen; where a liquor which is Salt on the first daies, distilleth like water; and then in the following daies becometh snivelly. But in a Consumption of the Lungs, while the spittle, of venal Bloud, begins to wax snivelly, the Snivel at first, seems to be Yellow and Thick, which afterwards becomes of an ashie Colour, and at length inclines more towards black : Because then they are the excrements of Transchanged venal Bloud, no longer the Co-mixtures of the juyce or liquor latex. Indeed after this sort, both keepers who do at first frame thick Snivel out of the latex, afterwards, the keeper wandring, it presently departs into a watery Brine, and again is thickned as soon as the error of the keeper is corrected : For the keeper, as well of the Brain as of the Lungs, is made subject to diverse injuries and unclemencies of Air, and therefore he calls to him the liquor latex on every side, being swollen with anger, through error, that he may compel it to go back or depart into excrements like unto his own passion. Therefore those Snivelly excrements are formed of the mass of the liquor latex; on which mass, a certain hurtful blot of error is sometimes imprinted, so as as the more liquid and unripe or raw Bloud is transchanged together with it, into snivel. Indeed, the venal Bloud it self, is by both wandring keepers violently alienated into Snivel, as well in the Lungs, as Head, no otherwise than as the venal Bloud in an ulcer, doth assume the form of corrupt Pus and Sanies. Therefore, besides the alterations of both the aforesaid keepers; no seldom impression is branded on every part, whereby the digestion

of every member is mightily hurt, or turned inward: by which chance, I call such an evil impression, the Tormenter of a Member, the hinderer of digestion, and depraver of the last Nourishment. About which indeed, the whole scope and hinge of healing ought to be conversant. Therefore the Keeper of the Wind-pipe is as well provoked above, by the injuries of the Air, as beneath, and by a homebred indisposition of his own Lungs. Let these things be thus, concerning the masse dedicated to the Keepers, and touching a masse bedewed for the last Nourishment of the joints: wherein, whatsoever is vitiated through want of integrity, that also increaseth into the occasions of many infirmities: And by how much the worse masse or immediate matter of which, shall wash against them, by so much the more powerful also, is the prick of diseases sprung from thence: And by consequence, abstinence, and fulness, of much juycie food, are fruitful means, as well to cure, as to make weak or sick. Therefore not any of the Liquor latex rusheth head-long out of the Head, which also sets upon us in the shew of Snivel, the white of an Egg, thin sanies, thick Pus, and corrupt matter like hony: For through the error of the digestions, and other impressions, offences and vices do happen in the Members, obvious with diverse faces: Which thing surely is to be diligently noted with a Pen of Steel, where the Curings and Healings of Sickneses are intended. Hence the error of cauterics or searing Medicines is confirmed:

74. For Issues do in some place profit, not indeed, because they do Evacuate the descending matter of a rheume, divert it, derive it, or draw it elsewhere; but as they diminish the whole Lump as well of the Liquor Latex, as of the nourishable venal Blood. In the mean time, Issues do not a whit detract from, or think of an error of the Members, and of a Disease there stamped or Characterized: because they are not for the taking away or moderating of a homebred destroyer, or disease indisposition: And therefore neither do Rheums fall downwards; but only defects are created by the destroyer, in the part wherein this dwelleth, or he hath his object, and Government.
75. In this path, Barley Broaths, those of Sarsaparilla, China, and the like decoctions are considered: the which besides an elementary Drink, do administer one far estranged from true Nourishment and a much juycie substantial and Spermatick or Seedy Food: And therefore they cannot but detract from the Lump of imbibing. For this is the dryness which Physitians intend to bring on, by the aforesaid Drink and Decoctions, not as they do dry up humors descending, or Phlegm (for moist things among Philosophers, do not dry up Humours) but inasmuch as they diminish the nourishable masse of the Blood, the which they do elsewhere restore by very much juycie Food cast in, and so they render themselves Childish, for the most part, by the effect of things succeeding. Indeed they might effect more by a slenderness of Food, than by all the tearing of the Skin, or cruel Scorching of fires, or the Drink of Woods, and Wild or barbarous Roots. These things therefore which I have said, are supplied in the Treatises of the Liquor of the Veins, concerning Cauteries, concerning the wandering Keeper, and of Catarrhs.
76. In the mean time, I greatly admire, that they have thought to relieve the Lungs by sweet things, and Ecligmaes, and by a licking: and they have doubted about Fox-Lungs, how unweariedly soever they knew him running, and they appointed Cures with Colts-foot boyled, steeped, drunk, and licked in by licking after diverse manners; to wit, by means which are neither immediatly admitted to the place affected, and which are mediately deprived of their antient virtue. But the *Schools* have never considered that if the sick party shall himself daily beat in pieces his own remedies, he shall by Thumping of his Nostrills, be able to attract some remedies to the Lungs themselves, to wit, by breathing in a small quantity of the Powder of the remedies so beaten: And that by this Method, he may be able immediatly to apply his own Balsams to himself; but in vain: therefore Lohochs or Eligmaes which are not brought down to the Lungs, shall be as yet more vain. And likewise they have neglected hitherto, a profitable way or manner, whereby they may immediatly connex the fume of Sulphur to the Drink: which smoak together with the Drink, doth by little and little unfold it self into all the Veins, not indeed in form of a Nourishment, but of a seasoning only; no otherwise than as the same fume doth free and preserve a hogshead of Wine from corruption. For nothing hath been hitherto thought on, after what sort, and by what companion in the waies, they may make a remedy, which otherwise, by it self, is not most fully admitted inwards, to pierce thicher. And although they saw that in thousands, they nothing profited by Syrupes, Ecligmaes, but their own purse; yet

yet without any further diligent search, they have alwaies hitherto persisted in the same Clayie path.

CHAP. XLIX.

The Humour Latex, neglected.

1. A disposing of things to be taught. 2. What may be understood under the word Latex. 3. The reason of that Surname. 4. The effect of four Humors introduced. 5. The distinction of Urine and Sweat from the Humour Latex. 6. Errours arisen from hence. 7. What hath deceived the Schools. 8. It implieth a contradiction. 9. The absurdities of the Humour Latex being unknown. 10. That the Whey of the venal Bloud, which they so call, differs from the Urines. 11. The unsavouriness and indifferentness of Qualities in the Humour Latex, by reason of their use, largeness, and Liberty. 12. The first Scope of the Humour Latex. 13. Another. 14. A third. 15. Sweat is from the matter of the Latex. 16. How Sweat issues forth. 17. The Sweat of dying Persons, to what it may conduce. 18. The coming forth of Sweat in the form of Salt-water is proved. 19. The fourth Scope. 20. The fifth. 21. The Humour Latex is excused. 22. The abuse of the Schools. 23. The bringing forth of the ignorance of the Humour Latex. 24. If the Schools were not fast asleep, they might have acknowledged their Errors by numbers, and weight. 25. The Squinancy hath alwaies deluded Catarrhs. 26. A necessity of the Humour Latex, although neglected. 27. What Thirst may bewray. 28. What the dryness, chapping, and fowlness of the Tongue in a Fever, do shew. 29. The Journeys, and Clientships of the Latex. 30. The Load-stone of the Latex. 31. Some discommodities of the erring Latex. 32. What things the Error of the Schools about the Latex, hath brought forth. 33. Some effects of the erring Latex. 34. Why the Latex doth easily hearken unto a strange Ferment. 35. The Author passeth by the Idiotism of Paracelsus concerning the Latex. 36. Whence Thirst in a Dropsie riseth. 37. Sweat is rather called, than brought of its own accord. 38. Baths and Cauteries are unknown whether they may be applied. 39. The Original of a Catarrhe is from the Ignorance of the Latex. 40. The Error of the Schools concerning the use of the Glandules or Kernels. 41. Whence there are so manifold Glandules in us. 42. Whence there is so easie or ready a Muckiness and Spittle of a Squinancy. 43. The curing of Diseases hath been hitherto Conjectural, Cloakative, and attempting Escapes. 44. The Author exhorts Physicians. 45. The drying of China hath brook forth from the Ignorance of the Latex. 46. An applying of the fore-going Digression.

I Being to speak of the one only Humour Latex, and that, hitherto neglected; the Question, whether it be or that it is first to be proved: & then the uses, necessities, or ends & Scopes thereof for which it serveth; Yet, before all, it helpeth to have explained by the way, what I will have signified by that un-wonted name. For truly, besides the one only nourishable Liquor manifestly and openly known, which they call the venal Bloud, a certain watery Liquor swims on it, being materially subjected not only to Spittle, Tears, Sweat, thin Snivel, an Oedema or Phlegmatick Tumour, also to other Diseases, but also Famous for divers uses. The Schools indeed have made mention of it under the name of the Whey of the Bloud, and have made it common as well to Urine as to Sweat. But surely, I shall shew, that the same Humour is far different in matter and uses; and by consequence, that it is to be referred, not among Excrements, but profitable juices. For I call it Latex, but not an Humour, that the abuses
of

3. of names may be taken away, after that I have sufficiently demonstrated by an express Book, that there never hath existed a quaternary of Humors in humane Nature, which the Schools have enlarged by repeated Centuries of Commentaries, and so have introduced Humors as Actors, into the Tragedies of all Diseases: which Book is Intituled, *A Passive deceiving of the Schools the Humorists*; in distinction to an Active one, To wit, least, in a stubbornness of repentance I may seem to have accused Malice. Wherefore a rash Ignorance of the essence of the venal Blood, hath over-darkened the whole Table of healing. Therefore they will have part of the Urine left to the Blood, also after the Urine is severed, and they call as well the Urine, as the same remainder thereof, the very Whey of the Blood: And I have seriously bewayled that undistinction, because it had been a miserable Fostress of humane Calamity: For the Urine, and its residue which breaks forth by Sweats, they have likewise (by one name) called the Whey of the Blood, whose chief Scopes notwithstanding, they have passed by. For they presently decline from that their own Supposition while as, whatsoever swims upon the out-chased venal Blood, they name no more, Whey, but yellow Choler, Choler or Gaul, and one of the four constitutive parts of the Blood: indeed they have dictated a feigned, bitter, sharp, and moist hot thing, no way at all in us conformable to the qualities of Whey, or Urine. But what may be to be conjectured from such confusions of the Schools, so Fundamental, and in things of so great moment, I have professedly and at large rehearsed in the aforesaid Book. For before me, *Paracelsus* first cast them out, as being guilty of a robbed or extorted Inheritance; but they being admonished, refused to be willing to be wise, although they were admonished, that they had mooved a Fire-band for its more ready Burning, to the destruction of man.
4. And first of all, I have sufficiently demonstrated, that there is not either of the Cholders, as neither Phlegm in nature: now moreover, I have determined to shew, that it was not sufficient for the Schools to have been Ignorant of the juyce or Humor Latex, and the particular aime thereof, but also that they have altogether erred in the Constitution of the same; because they are those which do far depart from the Terms of the Latex proposed, being deceived by the Similitude of Milk:
5. Because Whey is never Severed from Milk, but after the Corruption of its Milk, and therefore they compare a Dead-Carcase to the Latex. Next, Whey, because it is not made and appeareth but by the Cheesing or turning of the Milk, it was of the native Constitution of Milk; so are not Urine and Sweat of the matter of the Blood: Therefore at least-wise, they confels therein if any thing do swim on the out-chased Blood, it is a Whey, and of the same Species with the Wheyie body of the Urine: therefore now Whey doth formally differ from Choler: For that which can be absent from a permanent thing, is not of the essential disposition thereof: And so they plainly imply, that they are of the internal constitution and thingliness of the Blood, and likewise that they are not of the intrinsical constitution of the Blood. Therefore it is without an absurdity, that the Liquor Latex in the venal Blood, but with a lively floating, cannot by right be called the Whey of the Blood, and much less, a gawly Choler, and the fiery part thereof. Therefore the Schools have commanded that part of the Blood
6. which they call the Whey or Urine, to have remained in the Blood, rather through a carelessness of the separating Faculty, than for the necessities sake of an unexcusable essence: Because blood that is chased out of the Veins, is oftimes seen to be without Whey: And therefore they deliver, that neither is Whey left in the blood but for the more easie passage thorow the small Fibers of the Veins of the Liver, to wit, by giving a more fluid consistence to the venal blood: And therefore they say, those slender Reeds being overcome, nature hath presently meditated of a separation of the Whey, and hath commanded it to be brought down into the last Sheath of the Urine, by leaving the remainder thereof a companion to the blood, that it may also the more easily pierce throw the slender Trunks the of utmost small Veins. By which Doctrine, surely meerly Excrementitious, they defile the purity of the Digestions: because they have not known the principal Scopes of the Latex, and have feigned childish uses for the Whey of the blood: but I have alwayes confessed it for an undoubted Foundation, that the Parent of nature cannot be frustrated of his ends conceived, nor that any thing of Urine was left to be thoroughly mingled with the venal blood, by an ordinary error of nature. In the next place, that whatsoever Liquid thing is in the substance of the blood, that very thing is not of the constitution of the blood, nor the Excrement thereof; but that it is the Liquor Latex, being profitable for its own ends:

For neither is the Latex a part of the Urine, as neither a part of the Sweat. For first of all, the salt of the Sweat is distinct in its properties from the salt of the Urine: And the Latex is moreover, void of a manifest salt; and that is no wonder: Because the Urine, as it is now seasoned with a dungy Ferment of the Reins, is also transchanged by the same: For the Urine is made in its own Shops, and is completed by its own formal properties, being profitable for its own Offices and Aimes. Therefore the Urine differs not only from the Sweat, but also from it self, so long as it is not yet a partaker of the Ferment of the Kidneys, and of a liquid dung of the Intestines or greater Bowels: And that surely no otherwise, than as the dung of the Gut-Colon differs from the Cream of the Stomach, or the Chyle from the venal blood. There is not therefore in the blood, a part of the Urine, neither is there in the nourishment now refined, an Excrement actually corrupt, and that which is for corrupting of another: For that error is too daily and direct; for the removing whereof, nature hath not so sluggishly every where laboured; because she in nothing in all places, more industriously laboureth, than that she may most swiftly banish Superfluities troublesome unto her: For truly, all and every of Excrements, are now estranged (through an Impression of a dungy Ferment) from themselves in their former State, and therefore they should not be able but by the same natural Endowment, to consume or pine away every of the best things which are admixed with them. Truly the Humour Latex being thorowly mixed, wanders up and down in the venal blood, not indeed as a part of the blood, or as a remaining Excrement of the Urine; but as being profitable for divers aims or ends: And therefore also I have called it Latex, or a peculiar Humour distinct from the venal blood. It is indeed in it self, almost without Savour, and as to its first Scope, it co-tempereth the sharpness of the venal blood, that it may drive the same away: But especially after Labours, Heats, Sweats, Baths, &c. For in so great a breathing thorow or evaporation, the blood would be greatly co-thickned, unless it should have a watery part admixed with it for Sweat.

Another Scope of the Latex hath been, to wit, when as in all the more crude Chyle, cream, and venal blood, there is some Excrement, and the blood doth under digestion, reserve an Excrementitious salt, even while it is converted into pure nourishment; therefore the Humour Latex was a fit companion for it, which might receive this salt into it self, and brush it out.

A third end of the Liquor-Latex hath happened to the other two; that it may materially cause, that no Remainder of a thicker compact doth remain in the last Evaporation of nourishment; but that it may together with it, be expelled by puffing thorow the pores, by reason of a Ferment of the Arteries (as above in the Blas of Man) or may be washed out by reason of Sweat: For Sweat is materially, nothing but the Liquor Latex whereunto a superfluous Salt hath come: which thing is apparent: For from the drinking of Water, or thinner Ale or Beer, plentiful Sweat doth in Summer, presently flow forth: not indeed that the salt Latex of Sweat, is carried thorow the body in manner of a Vapour, that it may first cleath it self with a Salt under the Skin, and also a certain Oyliness: But Sweat is expelled in the form of Water (as in Health) or of its own accord is poured forth as Water, in fearful, swooning, and dying Persons: where by way of Impertinency, I take notice by the way; That the Sweat of dying Persons, is not so much the Liquor Latex in its own nature, as a resolved Alimentary or nourishable Dew over which Death commandeth; which is manifest: for presently the Habit of the body falleth, even as also in swooning: And that Sweat hath wonderful Virtues of mortifying the Hemeroides or Piles, and possesteth Exerescences.

Furthermore, that the Sweat is not carried by Heat in the shew of a Vapour, is manifest: For seeing a Vapour doth occupy a hundred-fold more Room, than Water, the body should swell in Sweating a hundred-fold more, than otherwise its proper extent is: For there is not an empty place under the Skin, which may receive a Vapour: also a Kettle of Hot water hath no Vapour within it; and that which it sends forth, it exhales only from the superficies. Therefore a Vapour doth not rouse under the Skin, but is driven forth only in the shape of a Liquor. Sweat therefore, is the Liquor Latex, materially shaving off, or washing away the filth from the Kitchens of the parts, through which it is brought, and therefore for the most part strongly smelling, and that in Diseased persons more then in Healthy ones: And so also in a Crisis or Judicial sign, it oft-times finisheth Diseases, as it brings forth with it, filths according to its ordinary Scope. The Schools have admired the dissections

of dead Carcasses: but they have not yet looked into the Anatomy of Sweat, by Digestions, Smoakinesses, Vapours, Elections, Admixtures, Resolvings, or Expulsions.

- 20 The scope of the Latex was more intimate: For seeing the Eye had need of liquor, that its Eyelid might be moved without hurt, and the Tongue wanted Spittle to temper the chewed Meats with moisture; but it should be absurd for the whole Food to be moistened by the Mass of venal blood: therefore the Latex is brought by the Veins, whence the Spittle, Tears, &c. should be made: for while in Squinancies, and the disgraceful Salivation of Mercury, more Spittle than is meet flows forth, the Paunch is made dryer then it self. Therefore the Latex wanders unhurtfully in the Mass of the venal blood, is brought unto fit places readily hearkening unto the distributive faculty: The which indeed, if at any time it shall snatch the Salt of the Brain with it, as in the pose; yet the Latex is not hurtful in its own nature, neither must that be blamed for a fault, which is unseasonably joyned to it (being guiltless) through accident. Likewise, although it being observant, doth abound in diseases, blows up Oedematous legs, that happens by chance: for nature by a general endeavour, brings forth a hateful Guest to her self, and stuffs it with Excrements, which she desireth to drive away. I find a Sheet in a most cold night, to be in the morning, bent and congealed by the night blast, the fourfold quantity of whose water at least hath also exhaled: And the blast of Air in Summer dayes, is no less; but much more stinking. Therefore some ounces of an unfavory liquor are puffed out from the Lungs alone: But that water is not the Excrement of the Lungs, as neither the matter of venal Blood resolved: wherefore it is fetched out of the Latex, whether it be sent thither by the distributive power of the Archeus, or at length, the Lungs do allure the same unto themselves; at leastwise it is continually supplied, and the ministry, which elsewhere the Glandules or Kernels do perform, this same service the substance of the Lungs performeth: And so, it is as it were the scope of the Humour Latex, to restrain by its moisture, that the Lungs do not chap through the dryness of attracted Air.
- 22 It is also an abuse to Teach, that the Latex is (in the beginning of a Pose) crude or raw and uncocted, and that in the number of dayes it is thickned by heat, about the end of the digested Ripeness: For it being once expelled, it expecteth not to be cocted, as neither the coagulation of it self, that it may grow together; neither could the Humour Latex, from the beginning of a Pose, ever have expected a thickning of it self, in an idle or void Scul.
- 23 Therefore the Ignorance of the Humor Latex, hath stirred up many Dreams in healing, in Catarrhs, and Oedemaes; to wit, the Legs being over night swollen, retaining a small pit of the pressing Finger, and vanishing away in the morning, is thought to be Phlegm turned into venal blood by a nights digestion. An ignorance therefore of the serviceable Humour Latex, hath brought forth the fables of a supposed Rheumatism: But if they had once come to a reckoning with themselves, they had seen; to wit, that over-night both Legs were loaded, perhaps with four Pound weight of Oedema or Phlegmatick Tumour: But it had been (as they say) a more crude Phlegmatick blood; seeing the Legs are not known by the Schools to be sinks of Phlegm; neither is there therefore a reason, why Phlegm should rather fall down into the Legs, than any other of the three remaining Humours; or than that Phlegm should fall down into the Belly, Thighs, Loyns, &c. Truly a just dispensing of Proportion, should daily require perhaps 40 Pounds for the expence of unripe blood, to be consumed throughout the whole Body. Basins and Chamber-pots are in one only night filled with Spittles, and the Bed-cloaths, together with the Shirts, do drop with moisture: the which, unless they are fetched from the Latex, and not from the Mass of lively venal blood, whatsoever things are believed concerning Meats, digestions, and making of blood, do fall to the ground together. For Arithmetick it self, and the Balance of weight, do delude poultry Physicians in their Fictions of Phlegm: but what ingenious man, will ever believe, that Spittle, Tears, Sweats, and besides, plenty of Urine is to be fetched from the very inheritance of the blood, without a present damage of life? especially because the same doth remain even for long Terms of time?
- 25 For let us feign a small Supper, the Stomach and Pylorus to have well performed their office, but a plentiful Salivation, in a fierce Squinancy; and exquisite Inflammations of the Almonds of the Throat: Surely that more thick and continual Muckiness, doth not flow down out of the Brain, the passage of the Jaws being now obstructed, and

and much less doth it ascend out of the Stomach which is empty, and under the stopping up of the Jaws: therefore let Spittle be the ordinary workmanship of the Tongue and Jaws, the matter whereof is fetched from the Latex; the which, according to the variety of its Ferment doth change with divers Masks; to wit, Spittles are watery, Snively, Salt, Sharp, Bitter, and tough like a thred. A daily plenty of the Liquor Latex, was therefore necessary in the Veins, and a ready obedience thereof unto the call of the Archeus. For although the Latex be unapt for nourishing, yet is it fit or convenient for its uses: For meats might be reduced into juyce without drinks (which thing, Mice, and Grass-hoppers teach) unless the Latex had been also needful for greater Observances. Thirst therefore, is a preacher of the Latex fayling, but not of the want of venal blood (as otherwise the Schools do command) also the Thirst of those that have a Fever, which continues after drink taken, doth denounce the Latex to be made unfit for its offices by a foreign contagion: For truly, as oft as bitterness, saltness, or a burnt Savour doth infect the Spittle, the Stomach is wearied with an unconcoction, and the Tongue (otherwise towardly, and having no evil in it) is cleft through dryness; it is signified, that the Latex doth not pass unto the Veins, as being instructed by a due Convoy or passage, because in the Inn of the stomach, and its neighbouring part, it hath become unapt for its office. Therefore the dryness of the Tongue, and the crufted filth thereof, in Fevers, is not an effect, or token of an Exhalation derived upwards out of the stomach (also not cocting the drink;) but it is a defect of the Latex defiled, or penurious through want.

It is not sufficient to have spoken of the Latex, and some of its uses and offices, by a distribution of its necessities: it helpeth also to discover its journeys, and to have rehearsed its Exorbitances: For the Law and necessity of uses, have also brought in as many offences, if not also double ones, on every side: For seeing the Humor Latex is not of the substance of the venal blood; but a foolish, harmless liquor, a co-running Companion in the wayes: Therefore also it is carried together with the blood, thorow the Veins; yet it is not the Whey of the venal blood, nor Choler, nor Urine: but after a separation of the Urine, the Latex receiveth its own Limitation, as soon as it is taken within the Cottages of the Veins: And after some sort it is enrouled without the Catalogue of an Excrement, while as it so easily obeyeth the calling, or commanding Archeus: For the Humor Latex wants salt, a tincture of the Urine, and the feigned bitterness of yellow Choler: For the Kidneys do suck out a salt Urine, which already, even in the Mesentery, hath adjoynd a salt to it self: otherwise, if any one do drink fasting, thin Ale, and that by tarrying out all night (as is the manner of the English) it is a wonder, how suddenly, often, and abundantly, he maketh water: That is, it flies thorow his stomach, Mesentery, and Liver. The fleshy Skin or membrane hath also a property of attracting the Latex, that it may rince it self, and the household-stuffe subjected within it; therefore much Sweat doth presently increase thirst.

And hence also wounds do oftentimes power forth an incredible plenty of Sunovie or Gleary or Gley water, as if the liquor Latex would fit it self to wash off the hurt conceived in the payning and ill cured wound. Indeed the outmost cloathing of the Body doth of its own property and free accord, allure the Sweat, and Latex; that seeing it ought to be like to a washing or Lather, it may receive the Spur of its calling from the Skin: By the leachery of which drawing, the Skin it self is easily filled with a Grease. Seeing therefore the Latex is appointed for many uses and offices, it follows also, that the same being exorbitant, doth become the occasional cause of as many, and moreover, of more Diseases; to wit, it receiveth a saltness, sharpness, and co-mixtures of that which putrified, being infected by the filths of the inward parts, and therefore it undergoes many diversities of Ulcers and Imposthumes; Even as also in the Skin, it stirs up its own and divers Itchings. Therefore the Schools do erre, which through an erroneous ignorance of the Latex, do refer these defects unto the guiltless Liver, and blame the distemper thereof, and do hurt the innocent Liver by their purging Medicines of blockishness: Neither do they take notice, that one only sheep doth infect a whole flock with the Seab, without any blemish of their Liver: and that to have wiped ones hand with a Towel, which a scabbed person hath used, doth propagate the Scab, without any contagion or defect of the Liver: wherefore through that ignorance of the Schools, they disturb the venal blood and Liver, as guilty of Heat; yea and therefore also, do they poure forth the harmless venal blood prodigally and repeatedly, with the curtailing of life, but with a frustrated event. But if

33 the Latex doth find any brackish thing within, infected with a sharpish brine of salt-
ness, or be pledged with the hidden contagion of a poysonous Ferment; now divers
malignant or ill accustomed Ulcers do spring up, and he falsely invents Cauteries to
divert Catarrhs. But the Sunovia or Glewy water doth oftentimes raine down with so
large a Showr, that if the venal blood, or nourishable Humor, or seedy dew should
cause the same, certainly a man that is penurious in venal blood, should of necessity
dye in few hours: And so the amazement of that abundance being neglected, be-
cause they have been ignorant of the Humor Latex, they have transported their Trifles
and false helps unto another thing. Therefore *Galen* knew not the thin corrupt Matter
or liquor of an Ulcer, whether he might refer it unto Phlegm, or unto Choler. But
it is no wonder, that the Latex being transplanted into a strange off-spring of rule,
34 doth stir up divers Troops of Uleers; when as the venal blood being provoked by
divers stroaks of Serpents, and transplantings of Diseases, doth exorbitate or exces-
35 sively arise into so numerous a variety. But I leave unto *Paracelsus* his own saltish
Microcosmical Fountains; and I willingly indulge his liberty, although together with
the Schools, he be ignorant of the Humor Latex.

The Latex therefore, doth easily drink up into it, a strange quality; Hence in the
36 Dropsie, there is much thirst, also after frequent drinking: for thirst is not made
through the penury of liquor; but through a composure of saltness. Let Sweats also
therefore be evil, if particular ones: For in that the members do one by one, call the
Latex to their aid, it is from an evil.

Two things therefore especially, are here further beheld; that the liquor Latex
is not carried so much of its own accord, as being called by the Superficies of the Body,
for whose help it was (otherwise) ordained: then also, that the Sweats of those parts
37 do witness a defect of the same: wherefore, Bed-cloaths being cast on a man, do
provoke Sweat, because it is called by an endeavour outwardly administred; and
therefore things which provoke Sweat, are oft-times given to drink, and coverings
are multiplied in vain: because the faculty drawing the Latex abroad, doth languish.
But if the Latex doth abound, neither is allured by the Skin, because it is defiled with
a strange blemish, it falls down to the parts, and stirs up unpainful Tumours, if it be
38 not also troubled with a quality: in which cases, as well Baths, as Cauteries have
now and then afforded help; not so much because they do diminish the effective
cause, as the product, that is, the Latex: And so a Remedy cloakative, and unto
the latter or effect, is applied.

In the next place, the whole spring of this evil hath been banished into the guilt-
less head of man, into Rheums raining down out of the head; The cause whereof, if
49 they have erred from, they ought also consequently to have strayed in the Remedies:
For I remember, that a Pleurisie beginning, hath presently failed or ceased through a
plentiful Sweat; the Sweat being allured by such a Diaphoretick as is that of the flowers
of wild Poppy, Colts or Nags dung, the juyce Dayse, and the assistance of the like.

Lastly, I have also noted, that there are notable Glandules or Kernels under the
40 Arm-pit, in the Groyn, and behind the ears; and likewise in the passage of the Urine,
nigh the Bladder, and about the gut Duodenum, and almost innumerable ones else-
where; placed at the two-forking of every vein. The one only use whereof, the
Schools will have to be; to wit, that the vessels may not be subject to tearing. But surely
there is a manifest error in the use named: For notable Glandules should be in vain
behind the Ears, where there is no fear of tearing, as neither within: & moreover, the
fleshy membrane it self is not stretched out, and so, Glandules could not be there pla-
ced but in vain, for a vanishing use and end; That is, the Arbitrator of nature hath
erred in the use of the Glandules, or the Schools do erre; seeing that in none of the
aforesaid places wherein the Glandules are seated, the vessels can depart from
each other: And also a slender Ligament had better and more commodiously
preserved the renting of a vessel, than a tearable and tender Glandule. I do every
where take good notice of the perpetual carelessness of the Schools, of narrow-
41 ly searching into the Truth: For they do not diligently mark, that the aforesaid Glan-
dules are not but for the emunging or attractive alluring of the Latex out of the veins,
that they may disperse Sweats into the habit of the body; which thing in the Tongue,
is manifest to the sight; where the Glandules do make or work the Spittle, and there-
42 fore do they allure the Latex. But under the Arm-pits, and in the Groyn, Sweats
do proceed; But they do not foresee a rending of the vessels: The former indeed, is
a daily office; but the other is not but an unwonted, rare, and rather a ridiculous one.

For

For the overflowing Latex, doth load the Veins by oppression, and if they are free from the same, the Arteries as it were breathing back again, doth retake to him new strength unhop'd for. Therefore the ignorance of the Humor Latex, hath invented, and supported Cauteries or searing Remedies, hath feigned Catarrhs, and hath caused all disagreeing Remedies or Succours to be dream'd of. For nothing of solidity against Diseases hath hitherto been weigh'd: Because I shall shew in its place, that the Beginnings of Diseases have as yet to this day layn hid unknown: and therefore also that Remedies are vain tryals, neither conceyning any thing of certainty, unless they be naturally endowed with a specifical property for certain Diseases: otherwise, a conjectural uncertainty will prepare privy shifts for them, and the credulity of the Sick hath fortified Physicians: which same Remedy, although it should be said to be appropriated to a Disease, it doth not help any body; yea, neither do purging Medicines, although they should undoubtedly loosen the belly, comfort the Sick by reason of the diversity of Complexions, and of feigned stubborn Humors: For they suppose, to wit, that such a Humor offendeth, and they see it afterwards to be brought forth by loosening Medicines, yet they see nothing of the fierceness of the Disease to be slacken'd; Therefore when they ought to acknowledge their ignorance, founded in Humors, and purging things, they reflect themselves on the variety of Complexions, and the uncertain and unknown differences of distempers: which things surely, if they are beheld with an equal mind, they shall not be terminated in any other end, than into a full knowledge, ignorance, and overthrow of the principles of Healing, hitherto. Wherefore I exhort, and humbly beseech Physicians, that they do in time, well learn the unheard of Beginnings, Positions, and unaccustomed Maxims of Medicine.

Wherefore, I have judg'd it meet to digress a little in this place: For as I have seen an Atrophie or Consumption for lack of nourishment, to be occasionally supported by the Humor Latex; So also I have seen Fatness or Grossness, in one only two months time, by a Urine-provoking drink instead of Ale or Beer, to be wholly expelled. But foreign potions of China, Sarsaparilla, Guaiacum, &c. which should pour forth the Latex by Sweats, by a feigned and lying title, have attained the name of dryers.

And indeed, I have already before demonstrated, that every visible body, & that which is believed to be compos'd by a mixture of the Elements, is materially made only of the Element of water, which originally hath it self in all constituted things, in manner of a Latex, and the which also, here to have supposed, is sufficient, as being once sufficiently proved. And then, the Maxim of Philosophy hath it; *That Bodies are not changed into each other, unless they are first reduced into their first, and easie following or clammy Matter.* For although they would have that thing apply'd to metallick Transmutations; yet it is to be drawn out of the noted sublunary Transmutations of any things: Yet not that they will have bodies to be reduced into the first matter of Aristotle; yea, nor also into the first Separation of the Elements (for neither do they think that the Food ought to return into its own Element, that it may thereby be made blood) but they will have a body to be transchang'd into its next matter, or that the subject of the former life ought to return back before it hath fix'd a hope of the bound of Transmutation to be attained: To which end, be it certain, that meats and drinks do assume the nature of a Chyle or juyce in the stomach, with a retaining of the qualities of the middle life of the meats: Indeed, that the ancient matter of the meats is destroyed, and made to approach very neer to the matter next to the Latex or the Element of water; to wit, the specifical Ferment of the stomach being busily employ'd to this end, no otherwise than as the Ferment of the Liver doth transchange the Chyle into venal blood, and whose companion and fellow, the Latex is, but not likewise a part thereof. But so differing and singular gifts of Ferments do exist in nature, that some living creatures do make venal blood, flesh, &c. for themselves, yea and also an Oylie grease, and water only: for in the stomach of a Salmond, Fisher-men say, never any Food or edible thing was found.

There are moreover in Salt-waters, some waterish little living creatures, in whom scarce any thing is bred, which do communicate a certain Seed of water drunk by them, from whence they do increase and sustain their own little body; so that to other Fishes which eat these small living creatures, a Seed is granted to be ingendred in the waters, which is pass'd over into life, and is deriv'd into the middle participat'd life, But small living creatures, which do immediately make blood to themselves, and their

their whole substance of water alone, have an example, almost in every vegetable, especially in stony and sandy Mountains, which are far separated from the dung of men, wherein, perhaps 60 particular kind of Rosinous trees are taken notice of, are fully nourished only of rain water, and of snow, or the *Lessas* or planty juyce of a stony odour, and do grow unto the greatest height, being trees so fat, that they would be choaked, unless they pour forth the same on every side. The ferment of the stomach in man, doth more easily transchange the meats into chyle, than their fatnesses, because fatness is more remote from the Latex, or the first matter, than the meat is.

46 Which digestion or transmutation into watery juyces, is brought hither to this end, that it may be manifest that the Latex (a foreign seed, and ferment of the members being easily conceived in us) is transchanged into a strange off-spring: And so, that out of the Latex (I have already shewn above) there is next of all a transplanting into an excrementous Snivel: where I remember, that after drink being abundantly taken in Summer time, a muscilaginous spittle (which at the time of dry thirst, failed) was presently after spit out by reaching. This is the new History of the humor Latex, to be referred unto the treatise of Catarrhs or rheums; because the ignorance of that Latex hath given a singular confirmation to conceived Catarrhs, as also hath offered rashnesses for things to be conceived.

CHAP. L.

A Cautey or Searing Remedy.

1. A Cautey is nothing but a remaining Wound.
2. No prerogative of a Cautey made by fire.
3. The name of an Issue or little fountain is a Juggle.
4. What things God hath seen entirely good, are praised by the Schools, as rent or toren.
5. The promises of a Cautey are childish.
6. The denyal of a Catarrh denyeth the use of a Cautey.
7. Ridiculous necessities for defending Cauteries.
8. The position of the Schools is shewn to be absurd and impossible.
9. What may be purged by a Cautey.
10. Nine conclusions against the appointments of Cauteries.
11. Foolish desires or delights in a Cautey.
12. Cauteries, whom they hurt.
13. The undistinction of the Schools.
14. The scope or end of a Cautey ceaseth.
15. They have circumvented the World by Cauteries.
16. That there is no communion of a Cautey with the brain.
17. Absurdities following upon the doctrine of Cauteries.
18. The one only refuge of the Schools.
19. Answers.
20. Cauteries are driven against the Rocks.
21. What the Schools may answer in the difficulties proposed.
22. The multiplying and choosing of a Cautey, by what boldness it hath arose.
23. Some Stage-play trifles of the Schools.
24. The Gown of Physitians is a mockery.
25. Cauteries are foolish.
26. They are vain in their own desperate cases.
27. It is not yet determined by the Schools in what cases Cauteries can help.
28. A case wherein a Cautey profiteth.
29. How the cruel and stinking remedy of a Cautey may be prevented.
30. A Cautey is unworthy a Physitian.

1 Catarrhs or Rheums have found out Cauteries: those therefore being taken out of the way, the treatise of these might seem to be in vain, unless I should write these things for young beginners; I distrust that my studies will any thing profit the learned or skilful: Wherefore I have determined to declare the ends and effect of a Cautey. Cauteries therefore are first of all made of fire, bright burning Iron; a corrosive caustick Medicine, yea with the rasour or penknife it self, or scissers, by cutting off something. It is sufficient, so the fleshy membrans are broken or pierced with a wound: But others do prefer a wound prepared by fire, or a caustick Medicine, before that which was laid open by cutting: Because they think that by actual heat and

and dryness, a flux of humors is the better stopped. As if, at one only moment, the fire should burn any thing besides the escharre it self, or should dry up an other thing which they feign, is afterwards to flow to the wound. Indeed dreams are on both sides greatly esteemed by the Schools: For an issue or small fountain (for so they call a Cautezied wound, that the vulgar may believe diseases to be drawn out as it were by a fountain) profits nothing before the escharre be taken away, and the foot-step of heat and dryness be withdrawn: Because the institution of a Cautey hath the avoyding of excrements or superfluities for its object, which doth not begin before the decay of the escharre, and because it is alway less able to exhale thorow the escharre, than otherwise, thorow the sound skin: therefore successours have accounted it to be all one after what sort soever an issue shall be made, so they shall divide that which holds together, and keep it divided. For that which God hath made whole and entire, that it might be very good, seems to the Schools that it should be better, if it be kept wounded: Therefore to be oftentimes wounded, and to have kept the wounds open, doth conduce to the health of the Schools. Surely its a wonder, that they have not transferred [to be wounded] unto the precepts of defending health, even as indeed, Cauteies, or constant wounds, have been referred thither: But in the time of wounding, or burning, letting out or shedding of blood only, doth interpose; which ought to excel by that title, in the Schools, unless the deceit of Phlebotomy or cutting of a vein did manifest it self. For they presume and decree, that a Cautey is a new emunctory or expunging place, whereby Physitians are able to restrain nature, according to their pleasure to unload her self, whereby, they feign, that she doth not indeed otherwise flow down by Catarrhs, and unload her self, or on every side so doth, but only by a hole made: That is, they cite rheums, to appear personally in a place, as the Physitian listeth. Handsomely indeed, if alike truly. Norwithstanding, these marvels have been so profitable, that now Cauteies are also made in Children, before the age of three years: But I, first of all, have alwaies beheld an implicate blasphemy in a Cautey, whereby they openly accuse the Creator of insufficiency in framing the emunctories: For I have bidden above a thousand issues to be filled up with flesh, whereof it hath not hitherto (as I know of) repented any. In the next place, I have considered a Childish presumption of Physitians, because they seriously perswade themselves, that nature will hearken to their own commands: also that a defluxion and falling down of humors which they command, being supposed, is a most exceeding absurdity. But let it be sufficient for my foundation, to wit, that there is no dismissing, or voluntary defluxion of a rheum: which negative subsisting, vain becomes the foundation of Cauteies: For the Schools teach, that by issues, evil, yea destructive humors are allured forth, which else, should either be sent to some other place, or of their own accord flow down. A fine thing, surely, that nature doth with a loose bridle, expect the Will of the Physitian, and opening of the skin, that it should there throw off its sardle, which else it would divert on a more noble member: As if sending nature should threaten, unless ye shall maintain a fleshy membrane open to me by a wound, where ye shall see meet, that by revulsion or drawing back ye shall appease me from fury, and do divert me from the concept of dismissing. Wo unto you: for that which else I would purge forth under the Skin, I will draw back unto a noble member in revenge. But I pray, in what center, or in what spring-head is that evil humor prepared? Is it in the Liver the shop of the four humors, as they will have it? But surely there is a difficult, long, and rough way, as that evil humor is derived from the liver thorow the hollow vein, and so thorow the heart, unto the outmost skin of the arm, thigh, or neck, without defiling the venal blood, but the evil humor it self to be sincere. Surely that is a cruel emunctory, which brings an evil humor thorow the fountain of life: And so, the Physitian is cruel, and the Schools more cruel, which command a hurtful humor to be brought thorow the heart. But if further, that evil humor, unknown to this day, hath the brain for its fountain; where I pray you? on in what sink of the head, is that evil humor bred? Is it in its bosomes? Or in its basin? not indeed in the first place, in the vessels of the brain, shall there be made a daily collection and nest of that malignant humor, without a present or sudden fear of death. But if in the basin that be made evil, which before was good; now it shall of its own wonted accord flow down thorow the nostrils and palate, neither shall it want a Cautey. Or what is that corrupter, which in some part of the head may vitiate by his endeavour, a humor that was before good, that it may be brought down

down malignant from thence, unto some part between the skin, which the Physitian hath commanded to be stricken? For how obedient is that, which being an evil humor (indeed now a dead excrement) shall suffer it self to be wrested back and sent to another place; which otherwise, being no more solicitous of the family-government of life, doth obey the law of scituation, by its weight only! But that the evil humor to be wiped away by a Cautey, is a vapour translated and collected from the stomach into the head thorow the brain, coats, and scull, and from thence dismissed between the outward Muscles and skin, that was before peremptorily hissed out, concerning Catarrhs.

In the next place, those things being granted, it should want the essence and Etymologie of a humor; by consequence also, of an evil humour, to wit, of Phlegm, one of the four: For whatsoever had once been lifted up in manner of a vapour, and had grown together into drops, is neither thick nor tough, nor any more of one of the four humors made in the Liver; but it should be a Post-hume distillatory liquor. Wherefore if any evil humour, the small cause of a cautey, be not bred in the Liver, Brain, or Stomack; which at length shall be the shop of evil humors for Catarrhs? Or which is the sending, and lofty part, from whence they may be the more steeply brought unto a Cautey?

9. For in so great a strait of trifles, the *Schools* are constrained to confesse, that not any evil humor is dismissed unto the hole of a Cautey; but that the venal Blood degenerates in the wound it self, and in its Lips being evilly disposed: For this also is
10. proper to all wounds, which want Balsame. Truly if the *Schools* do examine that Aphorisme, *while corrupt Pus or snotty matter is making, the pain, labour, and Fever is greater, then when it is made*; they would certainly know that corrupt pus is materially produced out of the Blood, by the labour of the faculties, and consequently, that in an issue, corrupt Pus is wished for, for the same ends: The which standing, the position falls to the ground, which supposeth that evil humors are derived by Cauteries. 2. That the bringing forth of corrupt Pus in a wound, is not from the Center of the Body. 3. That it is not the excrement of Rheum flowing down. 4. That Cauteries do not purge bad humours, which do prepare good venal Blood into an excrement, with the labour of the digestive faculty. 5. That Cauteries do not any thing conduce to the preventing of a malignant humor which is locally made in the Lips of the wound it self. 6. That corrupt pus, and Sanies, cannot go back-wards from the hole of an Ulcer, and slide into a noble part, and much lesse the good Blood from whence the corrupt Pus is made. 7. If the venal Blood be an evil humor before it come down to the issue, then nature ordaineth some bad humor from the masse of the Blood, for the wounded part only, that it may nourish it, or this is ordinary within all particular parts: now then nature wholly laboureth with the vice of folly. 8. That it is a foolish thing, that to have made much thick corrupt matter, is for the Cautey to have well purged; Seeing that corrupt Pus sheweth the corrupting of good Blood: And so while a man is not in good health, the issue, instead of snotty matter, weepes forth liquor. 9. If therefore a Cautey should make for the evacuation of ill humours, a man should needs be better in health, while liquor flows, than while snotty matter is made: Which in the position is false. From hence therefore it is rightly inferred, that no select ill humor, or pernicious excrement, which otherwise should fall down elsewhere, is evacuated by an issue; but that, that whole matter, whether it be corrupt pus, or a thin poyson, is nothing else but meer Blood, designed for the nourishing of the Cauterized part, and there corrupted by the vice of the part; and so that the corruption of it self, doth measure the goodness, and malignity of digestion in the place of the issue: And therefore while the whole Archeus doth in any sort labour, there is also a greater weakness of digestion in the issue, and the Pus is the nearer to putrefaction: and in this regard, the issue, by reason of a more powerfull hurting of digestion than was wont to be, weepeth liquor. Therefore it is the wish of the *Schools*, that of harmless blood, there
11. may very much and white Snotty matter be made: And that they call a good purging, if very much Blood be corrupted in the last digestion: which thing, if it be rightly considered, it will now plainly appear, that a Cautey is not to be imprinted for the purging out of a malignant humour, neither that a bad or evil humour doth exist; but only for the diminishing of the abundance of Blood; and so from a beholding of an exesse of a good humor only.
12. Whence it follows, that it is not convenient for Young Folks, not for those that are

are become lean again, not for such as are brought low by any disease, as neither for those that live orderly, and least of all, for religious abstaining Persons.

But they have not yet distinguished, whether corrupt pus in an issue, be only of the venal Blood, or of one of the four feigned humours, or indeed of a co-mixture of the four: If the first should be true, then the Pus should not be from an ill humour, but from the best of the four humours, and so an Issue shall be made void, and the best Pus, or the effect of an Issue shall be worst of all, seeing it was not but the corruptive of the best of all: But if they had rather devise, to wit, that the Blood is not at first evil, but becomes evil while it is separated from its other fellows; At leastwise the three remaining ones, shall in that severing, be as yet more bad than the blood, and upon every event, an Issue shall not be made but for an evil end, that it might corrupt the good and guiltless Blood: But if they will have the corrupt Pus to be made of the four humours being co-mixt; then a Catery errs in its end; seeing a Catery prevails not to purge out hurtful humours, but to corrupt the good ones, which are by nature (not erring) sent daily unto it self for Nourishment.

In the next place, a Catery shall not be to be reckoned, as a preventing of a Catarrh; or else, the matter of a Catarrhe should not be a vapour, nor also Phlegm; but venal Blood it self, which the Issue in it self corrupteth: For corrupt pus is not made of Phlegm, but only of venal Blood, as hath been sufficiently instructed in the *Schools*. Therefore by the essence of corrupt pus, being well searched into, in its matter, & efficient cause, the ends of Cauteries & the purgings out of Catarrhs and evil humours do cease: For indeed any sumptom of wounds being taken away in Cauteries, and a supposed health, it must needs be, that a loosing or seuering of that which held together, doth produce snotty matter in the Issue, and that that doth not flow from elsewhere; but that it is generated in the part it self. Also the Archeus daily dispenseth so much of the venal Blood to the parts proportionally, as they have need of for their own nourishment. Therefore the Pus or corrupt matter, is venal Blood vitiated in that part wherein the Wound is, and an effect of digestion vitiated in the same place.

Therefore to have vitiated the entireness, continuation or holding together, and digestion of the parts, next, to have converted the venal Blood into corrupt Snotty matter, is reputed the very same thing in the *Schools*, as to have gone to prevent Catarrhs or Rheums; or thorow the hole of a Catery, to have extracted from the Head (from whence they originally fetch all Rheums) an excrementous humor, which otherwise had threatned to fall down on a noble part; whether in the mean time, there be an agreement between the Head, and the Wounded part or not; for it is all one, so the Skin be detained Wounded, whether that excrementous humor be Blood, or be made snotty pus, or liquid Sanies, is all one, so by the three bare words of Catarrhe, prevention, derivation, revulsion, and an Issue, the world be circumvented. For I behold a small Infant of a Year old, now breeding Teeth, and to suffer a Fever, Froath of the Mouth, and Spittle, without ceasing; And at length that there are wringings of the Bowels, and Stools of Yellow-Green-coloured excrements: At least that Tooth is a part of the Head, wherefore the Flux shall be a Rheum of the Head: But what consent is there of a Tooth about to break forth, or a swollen Gum with a Bowel? Or what power thereof is there of begetting or sending away that Catarrhe out of the Stomack of a little Infant, unto his Head? And from thence into the Ileos? By what right shall a vapour dropped or stilled out of the Stomack, be made Cankered Choler in the Head? Hath perhaps the shop of Choler now wandred from the beginning of Life unto the Head? Could a Catery (if an Infant were for undergoing it) suck unto it a leaky Flux into it self? And by a few small drops of corrupt matter; recompence or Ballance the leaky Choler of some pounds? Why doth the Stomack of a small Infant frame a Catarrhe by reason of the pain of his Tooth? Why is it sent into a Bowel, and not unto the paining Tooth? Doth not the reader yet see, that a Flux is not a Rheum? But that the Archeus (wheresoever yee will have it) being enraged, is ready in the Bowels, to transchange the nourishable juyce into excrements, which by the *Schools* are reckoned Choler, Phlegme, &c. If therefore the Flux be not a Rheume, and the Archeus being wroth, can transchange any thing into a troublesom Liquor, if the Gum be but afflicted; shall not he be able, on every side to unload himself by the appointed emunctories? And not to wait for the Skin to be opened by a Caustick? Alas, hath cruel dullness caused the *Schools* to be cruel towards their mortal kinsfolks? For
neither

neither do they consider, that in Women, and those that are somewhat fat or gross, there is in the fleshy membrane, about the ordinary places of a Cautey, a meer grease to the thickness of two fingers at least, for which persons notwithstanding, the more frequent Cauteries (and those the more profitable ones) are perswaded; wherefore also the bottom of the Issue shall scarce be in the middle of the grease: therefore there is not a passage, whereby the evil banished feigned humour of a Rheume, may rush down out of the Brain, or between the Scull, and Skin, thorow the middle of the fat.

17 But what is that solitary humour, in the next place, which for its offence, being banished from the sending part, descending thorow the Substance of the grease unmixed, doth degenerate into corrupt Pus? If it be an exhalation of vapours out of the Stomack, why shall it not be more frequent to younger and hot Stomacks, than to weak, old, and cold ones? In what sort shall that water that droppeth out of a vapour, put on the form of Snotty matter? How shall it hasten thorow the Brain, Coats and Scull, to find a hole made by a Cautey, that it may flow down thither only, and be purged? Why doth not the vapour fly, first an hundred times into the Air, before it reach to the place appointed it by the alluring Cautey? How shall the Water which climbeth from the Stomack, be now venal Blood, and the mother of corrupt snotty matter? How shall venal Blood (the matter of corrupt Pus according to Galen) be the matter of a Catarrh? Wherefore is the blood to be reduced into the order of evil humours, which being not yet defiled, is dispensed by nature unto the wounded place? Why when the wound is made, shall nature cease to thrust down the condemned matter, by, and in to places accustomed unto it? For shall it, the Skin being opened at the will of the Physitian, become afterwards ignorant of the waies? Or hath it perhaps laboured only to find a passage elsewhere? And that being now done, shall it afterwards come the into obedience of the Wounder? Therefore these four particulars are false, to wit, that corrupt Pus is the matter of a Catarrhe; that a Catarrhe is materially from a vapour of the Stomack; that a Rheumy matter is expelled by an Issue; and that this Rheumy matter is diverted on a noble part, unless it be revulsed or drawn back to some other place by a hole. The *Schools* have (at least) one escape:

18 To wit, that Cauteries, in Chronical or long continuing Diseases, and likewise in the more fat Persons, and such as abound in humours, have oftentimes profited: Therefore it must needs be, that an evil humour at least is purged, and that the Body is unloaded by making of the Wound. Unto which privy shift I say;

19 The matter of a Catarrhe, its essence, manner, waies of derivation, and affect, and likewise an evil humour, and the ends of the Cautey, are feigned Dreams, the vails of shameful shoath and ignorance; and so that examples of events, are not sufficient for destroying the Superstructures of Truth.

20 What if Cauteries have sometimes profited: At least, that is not from the Root and essence of a Catarrhe, there being altogether none in it self: therefore if they have profited, let the *Schools* confesse that Cauteries do profit from means, and ends unknown to themselves; and that they do extol a conjectural remedy, uncertain and by accident, with so great a Praise: For they worthily have admired Cauteries to have profited from the event: for if any affect which was to cease of its own accord, or presently after a fullness of time, hath perished; do they therefore think that they have a right by Birth, of miserably torturing two hundred in vain, if a Cautey shall not prove unhappy to one by accident?

21 What if on the contrary, the Histories of many are compared, whereunto Cauteries have proved ill; they presently say we are not Empericks, nor are we moved by examples: For the *Schools* are rational, and are supported moreover, by the Authorities of the Antients. And that thing they thus loftily thunder out, as oft as they being destitute of reasons, and convicted by experiences, do cease to be most expert Masters, neither will they be bowed by experiences contrary to their own: But they flee with one accord, unto the reasons of predecessours, the which I have shewn to be wan, sluggish, false, and stumbling in their first entrance.

22 For truly when the *Schools* had discerned, that some perhaps by fortune had felt ease by a Cautey, presently a bristle, or cord being drawn on both sides thorow the Skin of the Neck, is believed to be a Remedy for an Opthalmy or Inflammation of the Eye, blear-eyedness, yea for Cataracts themselves, and a vitiated digestion of the Eyes: A Cautey in the opposite Leg, is believed to be a Medicine for the pain of the Sciatica or Hip-bone.

They

They have made tryal of diverse Cauteries or Searings, and smiths have made a large house-hold-stuff, they have instituted Arabick burnings (indeed nothing but Goats-dung fryed in a pan) deep in the great toes, for those that have the Sciatica, and joynt-sickness or Gowt: Indeed they have every where set to sale Stage-play trifles, and dreams, for truth, in healing: But the Schools have at length admired, that one only joynt-sickness, designed to Catarrhs, hath derided all their speculations and Cauteries;

To wit, that it hath shewn it to be false, that the gowt was made by a defluxing Catarrh or rheum, and that a Cautery was a vain devise of derivation and revulsion, for a humor falling down. I do also more admire their doating Cauteries, in a consumption, defects of the Lungs, head, eyes, reins, to wit, from vain rheumy defects, and so their butchery, together with their juggle, than I do strive to excel their vain attempts: For so, in persons that have the falling sickness, the *Paduans*, *Florentines*, and *Mount Pielirians*, do drive a hot burning Iron even to the seam of the Scull, and they promise that Epileptical fumes will depart out of the brain thereby, not only that they would lessen the continuance of the fit, but that they would oftentimes suspend it for the future: But the sick undergo these things with a deaf hope of health; but without example: Neither do they once weigh, that dreamed vapours do not affect the brain, through want of passage; but on the other hand, that causes do stir up the tempest of a Disease, before they can come unto the skin of the hair. Wherefore, wan and vain is the endeavour and aid of a Cautery, which begins from the effect, in curing of Diseases: For it hath not yet been determined by the Schools, in what affects Cauteries may be convenient, because they do seldom and by accident, alone help, and so, that it is impossible, their own suppositions standing, that Cauteries should be profitable, therefore also to find out the reasons, manners, means, and scopes of Cauteries. But besides the decrees of the Schools concerning a Catarrh and a Cautery being left behind, the case may also easily be found, wherein Cauteries may profit: For truly, by reason of the necessary innovations of the venal blood, at every station of the Moon (even as concerning a lunar tribute elsewhere) indeed whatsoever shall be left of the old blood abounding, beyond the period of the foregoing Moon, all that ought to go either into fat, or into the excrement of the last digestion: The which, because it is dispersed and drawn forth by a Cautery, beyond the daily transpiration; therefore fat or gross, devouring, plethorick, and sitting bodies, do now and then feel succour by a Cautery, and no other: Because the mass of venal blood is taken away, towards a just weight and requisite proportion: the abundance whereof, doth otherwise load and burthen the Archeus, the parts, and the digestions, and distributions of these. For thus far the fear of an evil at hand is prevented. Therefore the whole benefit of a Cautery to be hoped for, is situated in the moderating of the abundance of the blood, by a daily and pece-meal diminishing hereof: Else, the remedy of a Cautery is cruel, and stinking, which may easily be prevented by exercise, a just sparingness of dyet, and temperateness of living: whatsoever a more sparing food cannot heal, ease may not be hoped to be brought thereto by a Cautery. For the same things which make to the contemplation of a healthy and long life, excuse Cauteries. At leastwise the healing of a Cautery is alwaies cloaktive, and that only in some, indeed hitherto unworthy of the Schools of Medicine: for they are wont to say, unless the issue which is once imprinted, be continued, the fear of a greater evil is incurred: But be it the meer ignorance of the Schools, which have applyed a Cautery for every event, not unto the former or unto the cause and root of the Disease, but unto the latter or product, which was no where worthily to heal. Therefore it is as yet not known by the Schools, by what positions, and in what Diseases, this dissembling cure of Cauteries may prevail: Because perhaps, fortune and ignorance being their leader, they have attempted all things, and do now attempt them: So as they command of course, that if a Cautery shall not help here, not there, nor being repeated, nor much of snotty and liquid matter be poured forth, let Issues be purposely closed up.

CHAP. LI.

The Disease that was antiently reckoned that of delightful Livers.

1. The false name of a drop, in this Disease. 2. The Gowt grows daily more and more frequent. 3. The Gowt will presently distinguish choice Physicians from others. 4. Things proper to the Gowt. 5. The unconstancy of the Schools. 6. A hot Gowt doth not differ in the particular kind, from a cold one. 7. A hereditary one at least, is not from a Catarrhe. 8. After what sort the limitation or appointment of the Seal in the seed is. 9. Diverse fellowships of the Character, with the corporeal Seed. 10. Nothing of a rheumy substance in the Gowt. 11. Why the Remedies and preventions of the Schools are abusive. 12. How long Medicines will be unprosperous. 13. That the Podagra is not in the foot, as neither the Chiragra in the hand. 14. The manner of making in the Gowt. 15. Why the perpetual place of the Gowt, is between the co-touchings of the bones. 16. Why the Gowt doth infect the seed of the Parents. 17. Why it begins far from the heart. 18. The sharpness of the Gowt is not yet in its seed. 19. After what sort that sharpness is fermented. 20. What the Synovie is. 21. Whence a Gowty chalk may be formed. 22. From whence, and what is the afflux unto places of the Gowt. 23. Profitable and hurtful things, whom they may instruct. 24. Objects in healing. 25. The true Remedy of the Gowt. 26. A repetition of things spoken. 27. The name of a drop hath caused an error in the supposition or subject of perception. 28. A definition of the Gowt. 29. The rise and progress thereof. 30. It is decyphered from the first into the last life. 31. Wherein the sick may be deceived. 32. Canteries are vain in the joynt-sickness. 33. That no material thing which is humorous, is sent, doth slide, or is directed into places of the joynt-sickness. 34. The Remedies of the Schools, as well those of the Europeans, as Barbarians, are vain. 35. Drying drinks are derided. 36. The Schools through their own rashness, do fail in the Gowt, Consumption, Catarrhs, and Canteries. 37. Some things are chiefly true concerning moisture, and dryness. 38. Concerning different kinds of Remedies of the Gowt, elsewhere.

THe Arthritis, joynt sickness, being understood by the name of the Gowt, is attributed unto Catarrhs or rheums, that in many Nations, by putting one name for a another, it is called a Drop: unto which Etimology the sick do assent, and have given their labour unto so great blindness of mortal men; because they seem to feel the slidings of a certain drop, between the co-knitting of the bones: For the Schools who presume to teach every thing, do rejoyce that they have learned from the undistinct sense of the vulgar, and also proceeding without a diligent search, are become Rheumy.

But seeing I have already overthrown the whole fable of a Catarrhe, I will also discover the error of the vulgar sense, in the Gowt, which I have judged could never otherwise be done, unless I shall explain the tragedy of the Gowt from its beginning.

2 The Gowt remained unknown to the first ages, although man-kind, even from the Infancy of the World, did run into all luxury: But misery increasing by degrees on the weakness of men, it was at least so rare to the first writers, that it was scarce worthy of their quill: But the corruption of mortals; waxed afterwards more strong, it first of all arose in those who were most dissolute in Luxury: For hence it is believed to be the Plague or common destruction of those that are enslaved to leachery and riot, even unto our days.

Notwithstanding, seeing it doth now oftentimes molest Labourers, and Capuchines who are most abstinent; I have coniectured that the Gowt will presently spread

spread abroad over the people, unless God being merciful unto us, shall prevent its in part Hereditary, and in part attained damage.

In the next place also, I have from thence fore-divined, that that will be the Gowt, which is to be brought as a prognostical Sign, after a Quartane, between choice and thinkative Physicians: for when it hath once taken root, it not only abides a companion of ones life; but sometimes is unin-treatably transferred on remote Nephews: And so as it is ready, manifoldly to erect the fruitfulness of its Propagation for the future, it will distinguish of poultry contemptable Physicians: for there are many things which this prince of Diseases, doth keep as singular to it self: For besides stubbornness, it not only succeedeth through the begetting of parents, for some years; but also moreover, it thirty years and more, in patience waiteth, before it bewray it self.

Furthermore, the generater being not as yet Gowty, doth oft-times constitute an heir of his Gowt, almost the same year wherein the patient after generation, is to suffer the first beginnings of the Gowt. In the parent therefore, a silent, and not yet Plague, being bred, doth generate, before a just maturity of its Seed, which is denied to other Seeds in nature: as if the field of Humane nature being defiled, doth now of its own accord, beget the Gowt. I pass by, that it produceth small Stones, Chalke or Lime, diverse in their Beginnings from Duelech or the Stone of the Kidneys, or Bladder, and a rocky Monster, out of a wonted and due place, and that it doth deform a man being maimed and cut short in his Members, from so proud a structure, into a Monster. But the Schools do without controversy attribute the Gowt to defluxions; but it is not yet determined by them, whether that Rheum be lifted up from the stomach in manner of other things; or whether indeed by the Liver, through the narrow and most knit Receptacles of the Veins, so different a kind of Catarrhe be derived thorow the Veins, not indeed by a straight line, where the mouths of the Veins do end; but that it be stayed in unaccustomed, and wayes known only to nature, between the joynts, and Ligaments. But I being little careful of Fables, do suffer them to try both opinions. In the mean time they may be ashamed to have discourses of the causes of diseases, problematically only; and to have left them disputable.

In the mean time, I certainly know, that the Gowt, whether it slide on the heirs through the Seeds of the Parents, or in the next place, be contracted by a proper error of living, is of one and the same kind, with every property following it: Neither that that doth relate anything, whether a hot Gowt doth molest, and pain one greatly, or next, be reckoned more sluggish and mild through cold: because those are Ensigns of degrees, whereby the matter is ennobled or made remarkable; but do not vary its essence.

Then also I know, and have learned first of all, that at least an Hereditary Gowt is not derived from a Catarrhe, if it hath layn hid in the Seed, and that which is framed hereof, for the space of thirty years: For truly, seeing nothing that is external can be contained in the Seed, but for that very cause, it looseth the fruitfulness of causing off-spring; be sure, that nothing of a Rheumy substance remains in the Seed, and that there is not place for any Hostile matter there. Therefore it is confirmed, that nothing doth remain in the Seed besides a Character or Seal of things to be acted in the body constituted; and that that Seal is not indeed of so great a concernment, as to display the fruitfulness of a Seed, if an Hereditary disease, ought from thence to rise again in the Son, or Nephew. Again, neither can that Seal in the Seed, defile the Young with a monstrous deformity, although other Characters of Seeds by reason of their disposition, do figure the Seed: wherefore, although the Seal of the Gowt be in very deed in the Seed, yet it sleepeth, is silent, and layeth hid in the course of figuring, and so long as till at length, an opportunity of matter, and maturity being obtained, it unfoldeth it self. Therefore the Character or impression of the Gowt is in the Seed, as it were the first life, with a determination of silence, that it may sleep even till the first Fit, as it were a swallow all the Winter: Therefore the formative virtue in the Seed, doth not yet feel its own defect, by reason of the fault of a material Indisposition: for truly the Character in the Seed is not born to generate its Gowt, before its own maturity; which ripeness of the Character, is now and then not unfolded but in the Nephew. Truly although there are strict wed-locks of the Seed of man with the Seed of the Gowt, that they do promise as it were an undissoluble unity for the future; yet it is certain, that Diseases do not adhere to the root of the particular kind, unless in whom they are, as being created by a condition (as the

Falling-evil in the Elke and Swallow) but only unto individual Beginnings, whereto they are fast tyed as it were by accident. Therefore if there be nothing of a Rheumy matter, actually, in the Seed of the Gowt, therefore, neither also in the Gowt, which is to arise from thence; Seeing proper effects ought alwayes to bear a respect to their own causes.

In the next place, if any Hereditary Gowt doth want a Catarrhe, therefore also, any other; Seeing, of one thing in the particular kind, there are alwayes the same specifical constitutive Beginnings.

Furthermore, if that blemishing Gowty Character be so notably homebred to the Seed, so intimately social to it, sleeping with so patient a suspense, and not to be washed off by so many Circuits of years, and storms of Tempests; I have judged it to be altogether of necessity, for the same to be coupled to the vital Spirit. Whence first of all, it is manifest, that the supposed withdrawals of blood, and feigned Humors, for attempting the prevention of the Gowt, are vain: because that Character of the Gowt is not co-mixed with the venal blood, but well with the Governour of the Solide parts: for indeed the venal blood is many times changed, and the whole Fardle of nourishment, before the access of an Hereditary Gowt to come. From thence likewise it follows, that if the Character of the Gowt, being either transferred with the Seed of the Parents, on the young, or being gotten by the inordinate storms of life, be the connexed and efficient cause of the Gowt, and so that that be a true formal Gowt; it is a fabulous thing, whatsoever hath been devised concerning Rheums and Drops: For that absurdity being granted, that a Catarrhe raying down, did cause the access of the Gowt; likewise, whatsoever Weapon hath been retorted on this Disease, all that hath been directed unto the effects, the product, latter thing, or fruit; but nothing unto the cutting off the cause. But seeing the true causes in the Gowt, have been unknown to the Schools, and will stand unknown as long as the doatages of Humors shall prevail; it must needs be, that unprosperous and cruel Medicines have been hitherto applied by anynting, for an unseen mark: for the Gowt is not in the Finger, but only the Apple or Fruit of the root; and therefore, although thou shalt cut off the Finger, thou shalt not therefore cure the Gowt. For from hence two things do follow:

The first is that the Gowt doth immediately consist in the Spirit of life, neither therefore, that the fruit of the Gowt is the Gowt, or the root thereof.

The other is, that the Gowt doth not flow down materially, or (as they will have it) in manner of a Humor, as being a Bridge for the Rheum unto the joynts. Wherefore if I shall explain the Progress of the Gowt in its being made, I think, that by liberal wits, and those not yet defiled by any prejudice, I shall be assented unto: For in the beginning, after that the seminal Gowty Character is constituted (be it now all one, whether it shall be made to increase from the seed of the Parents, or next, be gotten by excess of living) it must needs be, that it hath prescribed limits of its continuance, as well in rising up, as in continuing, according to the law of its destiny, and the successive change of things obeying. When therefore, the beginning of this Gowty motion is at hand, the vital spirit being an obedient client to the corruptive Character, puts on a fermental sharpness, altogether hostile to it self, and foreign unto us.

In the next place, even as all sharpness, as well in the venal blood, as in the flesh, is demonstrated to contain the beginning and token of putrefaction; hence it comes to pass, that nature well perceiving or being thorowly sensible of that sharpness in the Spirit, which it conceived from the Seed or Gowty Character, doth presently stir up an every dayes Fever, before the coming of the Gowt: presently also a pain is well perceived in the proper place or Womb, to wit, where two Bones do touch each other; first a small light pain, but afterwards, as it were that of a burning Drop: Being increased, it afterwards stirs up Pains, Burnings, and at length, oft-times, Swellings: For then the sharpness being conceived in the Spirit, by a spiritual Fermentation; to wit, by an active alteration, defiles the Spermatical or seedy Glew which is conjoynd between the Ligaments, and the Bones.

I have already before demonstrated, that the Character of the Gowt is of its own disposition, bred to infect, and to be transferred with the seed (to wit, even as *Mercury* infects the Mouth and Teeth; but the Spittle of a mad Dog, the brain) as it were in an Inn, in which it oft-times lurketh for a long Race of years: Wherefore, by virtue of a co-resemblance, it is agreeable to truth, that the Character or Impression of the
